WHAT IS A TRUE ARCHITECT?

THE question—What is meant by “an architect,” has been recently asked by a man of some influence and some position at a meeting of an influential society, the inquirer adding that he himself had been unable to arrive at the meaning of the term, though he had taken some trouble to try to do so. We refer, of course, to observations which fell from Mr. Cole at a recent meeting of the Society of Arts, and which were reported in a condensed form in our impression for December 20th, 1860. We conceive that, inasmuch as the chairman of that meeting declined to permit any reply to be made

to these observations, although he failed to prevent them as he ought to have done had the subject been out of place, it is right to publish here something of what might have been said in reply to Mr. Cole's speech had leave been granted.

We shall merely, however, take the discussion at the Society of Art's rooms as a starting-point. We have already pointed out the want of candour and want of logic in Mr. Cole's speech, and are not going to dignify it by imputing to it a character of real inquiry after truth, to which it has no claim.

Although we are sure that Mr. Cole, judging only from the contents of his speech, knows enough about common things to be very well aware what an architect really is, had it suited his purpose to say so, his profession of ignorance is none the less remarkable.

Here is a great and influential body of men practising a distinguished and ancient art, and yet an Englishman, not without education and attainments, and claiming to be considered a leading man, can stand up amidst an attentive audience and venture to say that he cannot understand to whom to apply the name distinctive of this body, without a fear that his reputation should suffer thereby! Such an event makes it our duty to try to understand what a true architect is, and whether there is any real ground for mistake as to the term.

Architect is a word in use in nearly if not all European tongues, and is derived by them from the Greek, through the Latin. It and the related word architecture mean, the one highest, best, or chief builder, and the other highest, best, or chief building; an architect or *arch*-builder being a first or chief builder in relation to other builders, just as an archbishop is a chief or first bishop, or an archangel a chief angel.

If then an architect is a chief builder, some will suppose the meaning of the word to be little, if anything, more than a master builder. Important words in the English language are, however, usually far more truly significant than this explanation would make the word architect to be; and if the reader will take the trouble to find out the few words we have in the language compounded with *arch*, he will find that in all of them a person or an office is designated, about which a double meaning is conveyed, it being hard to say which idea is most prominent, that of being chief in the sense of being ruler, or that of being chief in the sense of being personally highest, foremost, and best.

This combined sense pervades the word now under consideration, an architect is a chief builder, because he builds in the highest and best way, and his art is architecture or chief building, as being the noblest manner of building. He is also a chief builder as being director of others, but that this is the secondary sense of the word, the first named being the primary meaning, is significantly shown by the fact that no analogous secondary sense attaches to the cognate term architecture.

When we look at an architect in the first of these two aspects, that of a *best builder* we understand at once what is not always clear to some, namely, the combination of art and fine art, which he needs to possess. A building to be done in the best possible way must be arranged for the most convenient discharge of its functions, whatever they are. It must rest with perfect security on its foundations, must be constructed perfectly well, and in every part must show that the very best thing possible for that part was known to the master builder, and was done by him. And, above all this, the building must be, in its design and in its workmanship, a work of beauty, feeling, art. There must be as much appropriateness of expression in it, and as much beauty in it as the circumstances will admit, and it is only when a building reaches all these requirements that it is a perfect building, and that its manner is the very highest building or perfect architecture; and it is only when its builder has attained this end that he is a perfect architect.

No human work is absolutely perfect, and there are few works of

art in which even ordinary spectators cannot see imperfections. Architecture, then, must embrace, and, in fact, must consist of, many manners of building short of perfection. Architects must be tolerated who fall below the ideal standard. What, then, if imperfections are to be tolerated, is the side where deficiency does the least harm? What, again, is the noblest of the qualities of a builder?—the presence of which ought most to entitle him to rank as an architect, even if weighed against defects in other qualities.

We are far, very far from being tolerant of defective construction, or faulty arrangement, and we never can withhold altogether our approval from buildings which display these two excellences, even if higher ones are strikingly absent; it is, however, hardly necessary to pause for a moment before deciding that it is not these, but the beauty and the expression of the building which are the highest and noblest of its characteristics, and that it is as a work of art, and not as a specimen of construction, that it will have its strongest hold upon human affection, and its highest claim to human regard.

Where a building reaches the highest possible pitch of artistic excellence its defects or excellencies, in a constructive point of view, are, for the most part, almost overlooked, and its arrangements are scrutinised with a comparatively careless eye.

Many an observer, nay, a worshipper, of the beauty of the finest remains of Medieval art would be quite unable to tell whether individual specimens had been well or badly built—nay, would be tenfold more delighted by some rudely constructed, clumsy piece of early work than by the most perfectly constructed fan groining or Perpendicular tracery of a late date. No one calls modern London houses works of architecture, and yet they cannot be exceeded as specimens of arrangement and adaptation. No one much loves many of our railway stations, where the best of materials and workmanship are displayed; and yet they are specimens of first-class structural skill, but with bad arrangement and no design. That Chichester steeple was so badly constructed that its own weight crushed it, has never been held to remove it from the position of a work of architecture of the highest order; and it is to the art, rather than the skill, of the architects of all ages that we turn with gratitude and reverence when we think over the great works of architecture with which the world is enriched.

We hold him, then, to be an architect who has shown himself able to build in the best manner, and we maintain that, while the qualities of the artist and the workman ought to meet in him, it is the former, and not the latter, which make him a real architect. No mere constructor and arranger can be called an architect, if, while engaged on structures that might be made works of art, he infuses no art into his work. A mere artist might be an architect, were he able, in spite of errors in arrangement and defects in construction, to infuse a true spirit of art into his buildings; though, in fact, such examples are comparatively rare. Instances of the presence of a high constructive genius, with no high art, are, however, frequent, especially at the present day.

Never has there been a period, since the time of the Roman Empire, when so much merely utilitarian building has been done in one country, as has been performed in Great Britain, within the last half-century; and it is to this fact that we attribute the state of public ignorance or indifference, which alone could make it safe for an educated man to stand up among some hundreds of other educated men, and say, “I don't know what an architect is.” The last century was not a building age, but, as England recovered strength after the great wars of Napoleon the First, she began a mighty course of building for purely utilitarian and commercial purposes. The cotton mills of Lancashire, the bonded warehouses of Liverpool, the docks of London, the factories of Birmingham and of Sheffield, the union workhouses, the prisons, the lunatic asylums, and the great network of canals, and the still greater network of railways, have all been vast works from which every consideration except that of use, construction, and arrangement, has been, in nine cases out of ten, rigorously excluded.

When architects in the true sense of the word have been entrusted with these works, they have ordinarily been forced to content themselves with attention to the first two parts of good building, omitting altogether the highest, and by degrees a profession has sprung up—that of civil engineers, consisting of men who only profess to study construction and arrangement, and to whose care works of most prodigious extent and importance have been entrusted.

There is no profession the members of which are less jealous and exclusive than the architects of England at the present day. The names of the great Renaissance architects whom Mr. Cole named in his speech are received among them, and honored without an inquiry as to whether the men had been “regularly articulated,” or where or how they had learned their calling.

The works of men who prove that they can build at once like good constructors and true artists are the only evidence necessary—nay, the only evidence *possible*—of their being architects.

No man can learn the fine art of architecture any more than he can learn the constructive art of engineering, without prolonged and earnest

study directed to that particular branch of skill, and without natural ability; and architects are perfectly ready, as ready as the public, to recognise ability and genius when it is shown, without inquiry as to what school it has come from, well aware that it has not been attained without labor, study, and genius.

There is, however, a natural tendency to distrust those who have not been known to devote themselves to the regular study of architecture, and for the very good reason that that study is so important and formidable that few persons can possibly master it without great, long continued, and almost exclusive application to it. The great men named by Mr. Cole did not arrive at their skill in the art without labor and pains, and if they acquired it in a way different from that often followed, and had the advantage of adding to it knowledge of other arts and sciences, it is none the less certain that they *did* acquire it; and the ease with which some of them added it to other great attainments is no proof of the smallness of the labor, but only goes to show the magnitude of the powers of mind possessed by a favored few, and that these men were exceptional instances is clear when we consider that they include the names of three out of the four greatest artists whom Italy produced—Giotto, Michel Angelo, and Leonardo—men who have been justly deemed giants, while, of the others named, nearly the whole devoted, after early youth, their *exclusive* attention to architecture, thus showing that if they were great enough to educate themselves to architecture they found it a study and an art filling up their whole time.

Now, it is not to be supposed that a military Engineer officer can have devoted any large amount of his time to the laborious study of the principles of beauty in building, and of the means which are under the architect's control for producing it. He has had other things to learn which are, like architecture, a life-study for a mind of ordinary capacity.

Accordingly, from the first moment when it was announced that the building was in the hands of an engineer, able as that engineer unquestionably is, every one expected what has come to pass—namely, that the structure would be a creditable piece of planning and construction, but that it would not be a work of architecture; that is to say, that it would not rise to the height of the noblest manner of building, and that it would not exhibit the chief quality for which it gave scope; in short, that there would be much skill but little art, or in other words, that it would be good engineering but *not architecture*.

Thus much for the particular instance which has provoked this discussion. Turning from it once more to the general subject, we repeat, that an architect is an artist who builds, and whose buildings are as well arranged and as well constructed, and, above all, as noble works of art as the occasion and the circumstances of them allow.

It is only recently that any large amount of consideration has, within the present century, been paid to beauty in building, and consequently the public, long used to regard structural excellence as the very highest excellence in building; in fact, as architecture, have not thoroughly learned to appreciate the value of that art which makes the monuments of past ages a perfect fountain of delight to us their successors, and which will secure for some, and only some, of the many costly piles which the present generation has reared, a lasting place in the affections of our descendants.

Accustomed to works of domestic engineering we had, as a nation, become indifferent to anything higher, and it is only by degrees that we can expect the country at large to be intelligently acquainted with what true architecture is, and consequently able to answer the question "What is a true architect?"

BATH ASSOCIATION OF BUILDERS.

WE have been asked to publish the following:—

"A short time since at the opening of the Liverpool Architectural Society, the President, Jas. M. Hay, Esq., in his address commented on strikes, and said, 'No permanent association exists among the masters, but in its place a mushroom combination, speedily got up to suit the emergency, which as speedily dies away the moment the contest is over.'

"It is the need of this permanent association to which we would direct the attention of your readers, and urge upon them to adopt means for procuring the support of builders in their respective localities, to back a request to the London Association, asking them to take steps in the formation of a general and permanent Builders' Association.

"Such a course becomes imperatively forced upon us, if we would still retain a proper directive authority over our own affairs, and be in a position to protect well-intentioned and sensible men from the baneful influence of the Trade Unions so severely felt by many thousands of workmen, who are utterly unable to help themselves by breaking off connexion with it, for to escape from its odious tyranny would be to forfeit their contributions to its benefit funds, thus sacrificing the savings of years, and incurring additional expense in joining others, and to which an insurmountable obstacle is in many cases offered by extreme age.

"Signed by the Secretary on behalf of the Bath Association of Master Builders.

A NEW WATERPROOF CLOTH.—It is stated that Mr. Szcerelemy has discovered the means of rendering a woven fabric completely impervious to wet or damp, and which will not crack or shrink, permits the perspiration to pass off, is exceedingly soft to the foot, and will fit it as a glove fits the hand. The product is called Panonia.

METROPOLITAN MARKETS.

IF it were required to adduce an instance of blundering legislation, or how over-careful provisions may end in a dead lock, no better case could be brought forward, perhaps, than that of the Cattle Market. Between the Corporation and Parliament a system of mutual checks has been instituted, for when, after a great deal of sparring, and much threatening of corporation reform, the civic authorities are forced to agree to execute improvements, Parliament or the Executive interferes, and insist on some other work being previously completed which the City is incapable or unwilling to undertake. It is about thirteen years since the meat-market question was brought forward in an official and tangible form. It had been agitated before by Mr. C. Pearson, in connexion with the construction of metropolitan railways; but it is not necessary to proceed further back than 1849, which may be taken as the starting-point. Then the desirability of abolishing Newgate-market was admitted as an established fact, and vested interests had to give in. Two years later came the Metropolitan Cattle Market Act, which led to a committee of civic authorities being appointed to decide upon a site to which Newgate-market could be advantageously removed, to negotiate with Government to obtain a part of Smithfield for this site, and to enter into arrangements with the Metropolitan Railway Company for the establishment of railway communication between the proposed new dead-meat market and the slaughter-houses to be established in connexion with the cattle market at Islington.

Somewhere about 1857—it having taken six years to get so far—Mr. Bunning, the city architect, prepared plans and designs for the construction of the market to the north of Long-lane. Indeed, he prepared three plans, each affording apparently ample provision. There was to be a market area of 150,000 square feet, with a sufficient number of approaches, each 60 feet wide. The cost of site and of constructing the approaches was estimated at £235,000; the expense of building the market was set down at £210,000, making the total outlay £445,000. A second scheme was subsequently proposed by the same gentleman, similar to the first, with the exception of an addition of an excavated basement, to serve as a railway goods station. The cost of site and approaches would be the same, but it would be divided into two sums, one of which, £188,000, would be charged to the markets, and the other, £47,000, to the account of the railway. The addition of the railway station would increase the cost of constructing the markets by £70,000 to £280,000, which it was also proposed to separate into two sums that were to be charged, one, £188,000, to the market, and the other, £92,000, to the railway. The total cost would thus be raised to £515,000, of which, £376,000 would be on account of the market, and £139,000 on account of the railway. A third scheme was prepared by Mr. Bunning which provided warehouses in addition to the arrangements indicated in the second plan, which would swell the total to £647,000, namely, £235,000 for site and approaches, and £402,000 for constructions. The cost of site was to be apportioned, £136,100 to markets, £47,000 to railways, and £51,900 to warehouses; the estimates for construction were apportioned, £166,000 to markets, £87,000 to railways, and £150,000 to warehouses. The totals would then stand, estimated cost of markets, £301,000; of railway, £134,000; and of warehouses, £201,900. Neither of these schemes in its integrity appears to have been sanctioned; but a fourth was prepared, which, at present, seems to have the greatest chance of success. According to the architect's plans and elevations, the new dead-meat market is to be built on a site standing back to the north of the thoroughfare from Long-lane to King-street. It is to be 625 feet long by 240 feet wide, and 30 feet high. The total area will be, as before stated, 150,000 superficial feet, of which two-thirds will be devoted to shop space, and one-third to the construction of a main road running north and south, intersected by broad straight thoroughfares. It is to have roads of access on the eastern, western, and northern sides, each 60 feet wide. The basement is to be excavated for a railway station, where trains will bring from the Islington slaughter-houses and provinces, dead meat and poultry, that will be hoisted into the market direct without passing through the streets at all. The estimated cost was £180,000 for construction, and £235,000 for sites and approaches. The warehouses seem to have been abandoned by the City, and that may not be an evil, for if left to private enterprise they will be more likely to prove successful speculations, and to have a higher architectural character. We shall thus have the total cost of the markets £415,000, and even that is likely to be augmented by the delay which has admitted of buildings being erected on various parts of the site, for which compensation will have to be paid when the market comes to be built. This is the price we have to pay for procrastination.

In addition we ought, perhaps, to take into consideration the City's subscription of £200,000 to the funds of the Metropolitan Railway Company. Not that there is any reason why it should not prove hereafter as recuperative a venture as original shares in the New River Company. The Corporation, however, was, it is believed, quite ready to embark in the outlay of £415,000, when came the stumbling block interposed by the wisdom of Parliament. The last Act reduced the tolls from 3s. 4d. to 2s. 2d. a ton on representations made by meat salesmen, which is a gross inconsistency in these days of Free trade, when the doctrines of commercial liberty have been carried so far as to abolish the Usury laws. The pretext for this interference was the protection of the consumer; but the consumer finds from sad experience that the less he is protected the more cheaply he can live, and that his most efficient protection is to be let alone, which leads to unrestricted competition, wherein he finds ample security for his pocket. The Corporation, just as any private individual

or firm, is entitled to a fair remuneration for outlay, and if that outlay is for public convenience those who profit by it ought to pay for it. If, by the interference of Parliament, this fair remuneration be disallowed, capital will not be forthcoming, and the Corporation, it must be remembered, have no available capital, but will have to borrow it to build the markets. The remuneration afforded by market tolls being insufficient the difference will have to be made up in some other way. That is inevitable, and must be clear to the cloudiest understanding, so that we shall have two taxes with a twofold cost of collection to defray one item of cost. In reality the interest of the consumer has not been consulted at all, but the interests of meat salesmen. The toll proposed in the Bill brought forward by the Corporation was a farthing a stone, or 3s. 4d. the ton. The Legislature, at the instigation of the meat salesmen, and on the pretence of protecting consumers, reduced the toll to 2s. 2d. The great economy of 14d. will, suppose the consumer had the entire benefit of it, reduce the price of meat half-a-farthing a stone, or one twenty-eighth part of a farthing in the pound—a fraction totally impossible to appreciate—from which the consumer can derive no benefit, but the whole of which will go into the hands of the salesmen—that is to say, the middlemen.

From evidence given by a salesman before a Select Committee of the House of Commons, it would appear that in Newgate-market 100,000 tons of meat were annually sold. On a former occasion, two years ago, it was estimated at 60,000 tons. Taking the salesman's figures as correct then, the reduction of 14d. a ton in tolls, will put £5,800 a year into their pockets, which is equivalent to a capital of £165,000. Why should the Corporation lose this amount?—or rather why should fresh taxes be imposed or existing taxes diverted from useful channels to flow into the pockets of middlemen, and Londoners made to suffer to that extent for their gain?

Not content with rendering the raising of capital difficult, and the imposition of new taxes probable, the legislature tacked a condition to the Act which up to the present time has operated to prevent the works being begun. Parliament introduced a clause prohibiting the Corporation from opening the market, and railway companies from using the station, until after a street had been constructed 60 feet wide from Victoria-street, at or near West-street, to the new market. The cost of the new street is estimated at £185,000, which would raise the total cost of the markets to £600,000. The Markets Improvements Committee are in negotiations with the Metropolitan Railway Company to reduce the cost of this street by £70,000. Should they succeed the total cost of the markets will stand at £530,000, a figure of sufficient magnitude to justify hesitation, and which we are assured will swell to three-quarters of a million; this we can readily believe with our daily experience of how estimates are exceeded. Fully admitting that the new street may be desirable, it is not proved to be a necessity; nor can it be so when the City architect, who knows infinitely more of the requirements of the case than all the members of the House of Commons united, did not feel called upon to include it in his plans. He provided ample approaches and streets on the three sides of the market 60 feet wide, where 2,400 butchers' carts may stand without interfering with the general traffic of the streets. But no; we are not to have the market till the street is made, which is not imperatively called for, and so Parliament in its wisdom reduces things to a complete dead lock.

Taking the figures as given in the report, with the hoped-for reduction in the cost of the new street, the cost of the markets will be £485,000. To pay the interest on this sum, Mr. Bunning, taking the present rental of Newgate-market to go upon, estimated, after deducting 25 per cent. for repairs, management, and collection, the net income from the new market would be £25,747. A speaker at the last meeting of the Common Council said the income could not exceed this estimate, and might fall to £17,000, on the grounds, we suppose, of an absurd statement which appeared in a former report of the Markets Committee, that increased facilities for the transaction of business by removal would reduce the amount of business transacted. The higher income will pay upwards of 5 per cent. upon outlay; the lower amount will pay nearly 3½, supposing always the estimates should not be increased. Should they, however, be augmented, the interest will be proportionately diminished, and will have to be made up from other sources. There is one point on which explicit information is desirable, and that is with regard to the tolls. According to the evidence given before the Committee, they should produce over £10,000. If they are not included in the rental, they would augment the income and go towards a sinking fund for the gradual extinction of the debt. With respect to City finance, we have long ago in these pages expressed our opinion. While conceding to the Corporation the right to recover its outlay, and until that is repaid to receive fair interest upon capital expended, we submit that it would be desirable to forego the idea of making profit beyond what is required to recuperate, and that it would be better to charge the whole sum in the shape of rental, instead of dividing it into rental and tolls, which must necessitate a double and needless system of collection, and therefore a twofold expenditure.

In connexion with the market between forty and fifty public as well as private slaughter-houses are to be built at Copenhagen-fields on an area of 5 acres 2 roods and 21 perches, or 27,284 superficial feet, with alternate carriage roads and railway slidings between each row of slaughter-houses, and to each of which is to be attached a suitable pound, so that while the animals are driven in from the market on one side, the carcasses of their predecessors may be hung up in the railway vans on the other side. It is proposed to wait until there is a demand before erecting these structures in Copenhagen-fields. Should the scheme be carried out, the appropriation of the locality will contrast with what it was proposed to do with it some time back. Just half a century ago a joint stock company was

started to convert the fields into a marine bathing place by conveying sea water from the Essex coast to Copenhagen-fields through iron pipes. The capital was fixed at £200,000, and elaborate calculations were published to show that 12½ per cent. would be the lowest dividend. The project did not take, for, thanks to steam, we go to the sea instead of bringing the sea to us.

The architectural design for the markets was severely handled in the Common Council. One gentleman stigmatised it as "the mean and miserable building;" but we apprehend that he would not recommend the Corporation to increase their outlay for decoration which is not likely to be seen, as people do not voluntarily walk among shambles. That the design may be open to the objection of being too low we can readily imagine, for 30 feet in height is too little. The reservoir for air over head will be too contracted, when it is remembered the immense volume of foul stinks that will ascend and which will be likely to be deflected down again. As reference was made to the Paris central markets, we may state they have twice the altitude of Mr. Bunning's design, and we may also add that Mr. Vallance's assertions with respect to the Halles Centrales are altogether erroneous. They are not "fancy structures," but are ten huge sheds connected by covered ways. They are built after the Crystal Palace style, of iron columns tied together and supporting a light zinc roof. The spaces between the columns on the outside are filled up to about 8 feet above the ground with brickwork, and at top with louver boards. They did not cost "more than £2,000,000," nor anything like it, but the purchase of site for the erection of the markets, the construction of the approaches, and the formation of the Square des Innocents have necessitated a large outlay, the amount of which cannot be known, as important works remain to be executed. The tenth shed, or pavilion, as it is called, is included in this year's estimates; next year and after there will have to be executed the completion of the Rue des Halles, the opening of a new street between Rue de la Tonnerrie and Rue St. Honoré, besides widening of Rue Tirechape, and in part of Rue St. Denis and Rue des Lavandieres. Then, although meat is sold in the Halles, the system is quite different to what exists here. In Paris butchers buy live cattle at Poissy market, which are sent to the *abattoirs* to be slaughtered and dressed and afterwards transferred to their shops. Little dead meat, if any, is supplied from the provinces, and there are no market salesmen. Of late years, and since the butchers' trade has been thrown open, meat has been sold by auction—*à la criée*—at the Halles, but butchers do not buy there, or only those who have stalls for retail dealing in the Halles and various market-places of the capital. In fact, we cannot institute comparison between London and Paris markets, and it would, therefore, be absurd to seek to copy them. Paris markets more closely resemble eastern bazaars than ours do, and are an aggregation of stalls of retail dealers who cannot afford to pay rentals for shops, rather than for wholesale transactions, although, of course, they do take place.

In 1182 Philip Augustus issued an ordinance enjoining Jews to depart from the kingdom of France within three months, confiscating their real property and authorising the sale of their movable effects. This act was the commencement of the persecution of Jews in France, but from the evil sprang the good of exchanges and the origin of banking. The Jews expelled took refuge in Lombardy, where they gave to foreign traders and travellers secret letters to parties in France with whom the exiles had deposited what they could save of their property, authorising payments to the holders of the letters. The convenience was found so great that the stratagem devised to elude spoliation under infamous persecution was introduced into commerce as letters of credit. Out of the plunder of the Jews Philip Augustus built, at the instigation of one of his courtiers, two *halles* outside Paris, 1183, at Champeau, where Louis the Fat had established a fair or market. He bought from the directors of the Leper's Hospitals, St. Lazare, the right to hold a fair that he transferred to these *halles*, which he surrounded with a wall, furnished with gates, that were closed during the night, and he roofed over the stalls. He likewise transferred to the new *halles* the market that used to be held in the *cité*, before the Magdalen Church. The Knights Templars about this time established shambles on their property—for these chivalric monks had no scruples when it was a question of making money—but the butchers' guild complained of interference with their vested rights, and the King reduced the knightly venture to two stalls not exceeding 11 feet in length each. In 1278 Philip the Bold built a portion of the *halles* against the boundary wall of the graveyard of the Innocents, to accommodate "poor women" and "miserable persons" to sell old clothes, shoes, and leather. In 1416 the first meat market was introduced into the *halles*, when Charles VI. ordained the establishment of four *boucheries*—one in the Halle de Beauvais, another near the Petit-Châtelet, a third near the Grand Châtelet, and the fourth round the enclosure of St. Gervais' graveyard and on a portion of the graveyard of St. Jean. In fact, graveyards seemed to have been favorite sites for markets. Under the first Empire most of the existing markets were constructed, and it was a saying of Napoleon that the Halles should be the Louvre of the people; but what he meant by that is not very clear.

THE WESTMINSTER BRIDGE APPROACHES.—The block of houses reaching from the Clock-tower of the New Palace and terminating with Fendall's Hotel, and facing the north entrance to Westminster Hall, is in process of demolition, and it is expected that the whole of them will have been removed by the meeting of Parliament. The whole space between Westminster Hall and the north side of Bridge-street will thus be opened, and from Westminster-bridge a splendid view of the Houses of Parliament, the Abbey, and adjacent buildings will be obtained.

NEW VESTRY HALL, ST. GEORGE'S-IN-THE-EAST.

This new hall, the foundation-stone of which was laid on the 16th July, 1860, was formally opened in August last. It is situated in the Back-road, being erected on a plot of land formerly belonging to the Trustees of the Wesleyan Centenary Chapel, and overlook at the back the burial-ground of St. George-in-the-East, &c., and the London Docks.

The building occupies a site of about 57 feet by 60 feet, and consists of three floors. On the basement-floor (which is partly above ground, and access to which is gained by a flight of stone steps in the area) is accommodation for the residence of the hall-keeper, consisting of parlor, kitchen, scullery, coal place, pantry, cellars, strong-room, boiler-room for the hot-water apparatus, &c. The ceiling under the principal stairs and entrance-hall is formed with brick arches, plastered, springing from cast-iron girder, the haunches being filled in solid with concrete to carry the Portland stone floor above. The staircase, hall, and cellars, are paved with York stone, the stairs being of the same material.

On the ground floor are an entrance-hall and vestibule, spacious stone staircase to the principal floor, vestry clerk's offices (with fireproof room), surveyors' offices, and offices for the Medical Officer of Health, Inspector of Nuisances, &c. This floor is supplied with water-closets, urinal, and lavatory, the whole being well lighted and ventilated.

On the principal floor is a large hall 54 feet 6 inches by 33 feet, the whole height being 24 feet. A gallery with two tiers of seats runs the whole length of the hall at the back, and is approached by a distinct stone staircase, access to which is gained from the principal landing. On each side of the principal doorway to the hall, are the smaller ones, leading to the committee and cloak-rooms. Over these are three bed-rooms for the hall-keeper. The cloak-room is fitted up with a lavatory, &c.

Provision is made throughout for heating and ventilating. The latter is effected in the large room by two shafts running from the ceiling to above the roof, securing two separate currents of air. The whole of the rooms have open fireplaces. The hall staircase and entrance hall are heated by hot water.

The decorations of the entrance-hall consist of Doric pilasters and entablature supporting a panelled, coffered, and moulded ceiling—the same arrangement being carried through to the staircase, the landing over having a coffered ceiling in one panel, with a bold enriched flower in the centre. The mural decorations in the large hall consist of moulded panels between Roman Ionic Pilasters, the caps of which have wreaths of foliage suspended from the horns of the volutes. The pilasters have a base and pedestal, the mouldings of which are continued round the room, the dado being panelled in wainscot. The ceiling, coffered and panelled, springs from a deep cove; the centre panel has an enriched marginal moulding, with scroll centres and corners. The panels flanking it are formed of perforated ironwork, the foliage pattern of which is well executed, with central rings which receive the sun-lights by which the hall is illuminated, and which materially assist the ventilation of the building.

The general features of the front are Italian in character. The front elevation, of Portland stone, shows three stories, the two lower of which are rusticated. The principal feature of the ground floor elevation is the porch, which is formed of Doric columns and rusticated pilasters, carrying an entablature with triglyphs, &c. The doorway is deeply recessed with moulded jambs and architraves, and

has a circular head, the tympanum of which is filled in with elaborated wrought-iron-work. The spandrels are to be occupied by medallions. At the foot of the steps leading to the porch are two sub-pedestals to receive an ornamental cast-iron balustrading and bronze lamp standards.

The upper and principal floor is divided externally into five bays by attache Ionic columns, being coupled at the angles; the entablature is surmounted by double blocking course, broken over each column and finished with a ball. The jambs of the windows are formed with pilasters with foliated capitals, carrying an enriched entablature with cushioned frieze. The window heads are circular with archivolts and keystones, the tympanum being filled in with sculpture. The panels beneath the windows are filled in with moulded balusters, the pedestal, moulds, &c., of the columns being continued across the façade.

The whole of the works have been executed by Mr. Thomas Ennor, by contract at £4,675, under the superintendence of the architect, Mr. Andrew Wilson.

THE NEW MIDDLE TEMPLE LIBRARY.

THREE or four months ago the Prince of Wales publicly opened the new Library which Mr. Abraham has designed and Mr. Myers has built for the Honorable Society of the Middle Temple. In our Volume for 1860, at pages 330 and 647, we gave full descriptions of the work; and at page 139 of the Volume just completed we engraved a view of the river-front—then misnamed the "Inner" Temple Library. We now publish a view from the north-east, showing the principal entrance.

The main apartment is 85 feet long by 42 feet broad, and occupies the whole of the principal story. Its sides are lined with bookcases, and in the windows over them blaze the arms of the various Treasurers. All the work is executed in the best manner: the metal work is by Hart; the glass is by Ward, of Soho. The stone carving of Mr. Myers needs no word of praise; it is well known, and its excellent quality is universally acknowledged. The building is altogether, perhaps, the best specimen of modern Gothic work to be seen in a civil building in all London.

VALUE OF REVERSIONARY PROPERTY.—A reversionary life interest was offered for sale at the Auction Mart, by Messrs. Chinnock and Galsworthy, comprising the Frampton estates in Dorset, extending over nearly 8,000 acres, with a rental of about £10,000 per annum, together with a present life interest of the reversioner, aged 23, in £400 per annum, and £1,600 per annum on the decease of a life aged 47, secured upon the above estates, the gross rental of which does not fall to the reversioner until the decease of the life 47, and another aged 52; the contingency of the young life surviving the two elder had consequently to be insured. The reversion was sold subject to a mortgage of £5,000, and the price realised was £11,150.

A FEW SUGGESTIONS FOR 1862.

THE assertion is constantly made that it is the fashion with Englishmen to "run down" their country. To do this without cause would be senseless, as well as unpatriotic; but it often happens that there are real grounds for fault-finding, which may, and frequently does, imply a readiness to examine and amend. The tendencies of man are naturally towards himself: his family, his neighbourhood, and his town or province are apt to be in his eyes the most important objects in the whole world. Though this purblind affection may be pushed to absurd lengths, it has its favorable side, for from the seeds of self-love and local interest are thrown out the strong and deep roots of patriotism. Homely minds may be stigmatised as petty and narrow, but they need fear no comparison on the score of practical usefulness with those larger souls which range over the universe, and, finding no resting-place for their sympathies, return empty.

Grumbling, so that it be not done in a merely captious, querulous frame of mind, but with an honest desire for progressive improvement, is a good symptom in the body politic. It is our bounden duty to survey, from time to time, our position, and, instead of blindly maintaining that whatever is done by us is and must be right, to see in what we fall short—not of the state of other nations, but of the standard capable of attainment in a civilised community. In a survey of our national condition we must own that we are generally found unprepared, be the occasion great or small, and might speak of our country as "England the unready." A very brief review of our late history would show this to be true; and even now, in the critical posture of our relations with the Northern States, is it certain that we are ready with men as well as with ships? Official statements would make it appear that we are. Let us devoutly hope so, and add the fervent prayer that, if it be at all consistent with national honor, the black cloud which impends over us may yet burst without the thunder of war and the hailstorm of injury to our accumulated savings—our wealth and prosperity. In the face of the great and tremendous interests at stake, it may seem trifling to descend to civic minutiae; but, be the event as it may, the daily life of England will go on much the same, and there will be time and opportunity to attend to matters of a purely social and domestic character. We propose briefly to consider what preparations can be made for the vast influx of persons whose presence in London we may reasonably expect in the coming year, and to offer any suggestions which may occur to us.

It has been observed how much the population has changed in the ten years which have passed since the former Exhibition. The children of that period are men and women now, and there has absolutely arisen a new generation. From the great increase in the mere numbers of the people, aided by the facilities of travelling afforded by the opening of many more miles of railway, we may look for a great crowd of visitors. The power which we already possess of accommodating an immense floating population may be pressed beyond its limits, and we should do all that is possible to allow of their expansion. Doubtless the eyes of lodging-house keepers have been dazzled already with visions of crowded houses and high charges, accompanied by those pickings (*not stealings*) so familiar to all those who have fallen into the clutches of certain harpies of the fraternity. It has always been a subject of wonder to us how people could have the audacity to charge, and others could be guilty of the incredible folly of paying, for very inferior lodgings, the exorbitant sums which are evidently quite the usual thing in "good" neighbourhoods. Despite the lash of the satirist, there is still a hankering after "Mews-street, Grosvenor-square." Season after season the same dusty, grimy webs enmesh the motils of fashion; and families, rather than pass out of a charmed circle, are content to inhale a stifling atmosphere, in small, inconvenient rooms, encumbered with old and heavy, or decked with modern and tawdry furniture.

Others, however, imagine that they have no choice, and submit to discomforts in sheer ignorance of whither else to go. Here is a want that might be supplied. The more reputable and fair-dealing of lodging-house keepers should endeavour to meet the tactics of their flitching and loud-mouthed opponents, and adopt some method of making more generally known what accommodation is to be had, and at what rates. At the same time, householders generally should guard against running into an error committed by some in 1851, who, reasoning probably from their own experience of "seasons" in watering places, thought that, by exhibiting in their windows cards, notifying that "apartments" were to be had, they would have numerous applications, whereas many well-deserving persons, who could have honestly guaranteed "all the comforts of a home," could not let their rooms at all. We should dissuade private individuals from undertaking to let apartments, if only for the simple reason that lodging-letting is a business, and one by no means easily learnt. There are real trials to be undergone, arising from the caprice of some who want in lodgings more attendance than they are in the habit of screwing out of their servants at their own homes, and from the mischief of those who are utterly reckless in the use of other people's property. So that there is some allowance to be made for the hard bargain driving and vulgar insensibility of the drabby Mother Pendragons.

London is so vast that anything like a search for apartments is impossible. Well known streets, like those on the river side of the Strand, are usually in a state of plethora, while other districts are comparatively untenanted. Few persons, acquainted with the locality, would select the Strand for a residence, except for its business situation; and it seems to present few attractions to a visitor on a trip of pleasure. The incessant wheeled traffic—or, almost incessant, for there are only about two hours in the early morning of comparative quiet—by no means points out the quarter as one of the most eligible in London, apart from the consideration

of its proximity to the Thames, which, under the influence of the summer sun, emits an odour more pungent than agreeable. It is from the extortionate rents—in proportion to the accommodation given—of the west-end houses, with their miscellaneous extras for plate, linen, attendance, &c., on the one hand, and the distracting din of streets near crowded thoroughfares on the other; that many of our country visitors form their opinion, and go back to their homes heartily sick of London. Surely, dirty and dear as town is, we might have something better to offer than is usually found.

Take again the hotels. If a friend asks one to recommend an hotel, what answer can be given? A very unsatisfactory one, for almost all those that are good for anything obtain high prices, and are suited only to wealthy birds of passage. More hotels on a better system would be a real boon—say, for a known example as the Pavilion, at Folkestone, with two *table d'hôte* dinners, one early and the other late, per day, at moderate charges, and with a variety of dishes. The whole question of hotels has been so recently brought before the public that we can have nothing new to say, but we may endorse the statement that hotel keepers should give a tariff of prices, *including* attendance, so that an iomate may really know the end of his expenses. Something has certainly been done in this direction; but the majority of landlords in town and country seem not to think it their interest to be too candid as to their charges, and the result is what one would naturally expect, that any one who is obliged to travel, contrives to manage his journey so as to have as little staying at hotels as possible. Something might be said also about choice of food. Who is not tired of hearing in reply to one's inquiry, "What have you in the house?" "We have some very nice corn beef, Sir; or we can get you a nice chop or a steak, Sir." This sort of dialogue, however belongs chiefly to the small towns, which had better bow to their fate, turn their four or five hotels into museums, libraries, or reading-rooms, and leave one or two proprietors, who could give all the accommodation that is ever likely to be required. The railways have sounded the knell of hotel keeping in small places which are ordinarily visited only by a commercial traveller or so, who hurries away as soon as his business is completed. The bagman's trap even is become a rarity since railroads intersect the country in every district in which there is any trade to be done.

What shall we say to the omnibuses? The magnificent promises made by the Great Monopolist Company have been but ill-fulfilled. Some new omnibuses have been placed on some roads, but only by pressure of competition with a rival company, which gave the public for the first time a really convenient vehicle. We have not forgotten that, with the opening of the former Exhibition, began an increased scale of fares. Then we had the *fourpence*, which is still kept up for intermediate distances. The fares want a thorough re-arrangement on some more intelligible plan than is in use at present; so that every one may know what he is to pay. It is all very well to say that if you have any doubt, you should read the list of fares inside the door. Any hesitation would call forth the inevitable—"Now then, Sir; if you please, Sir; when you are quite ready, Sir." Moreover, this list is made specially bewildering, and designed, as it would seem, to catch sixpences instead of the lower rates. One passenger may pay sixpence for a distance which another may exceed five times for a smaller sum. We might certainly take a hint from our neighbours, and have the word "Full" put up when there is no room inside, and thus obviate the unpleasantness on a wet evening of a dive into the mud—and such mud!—only to find that there is a pleasant seat in front, where, as the conductor suggests, "You can have the apron up."

Although the cabs are much improved since they have been more completely under the control of the Commissioners of Police, there still remain many wretched four-wheelers, drawn by animals which are skin and bone, and whose legs are knocked to pieces by hard work over "the stones." The remedy lies mainly in the hands of the public, who need not hire dirty, ill-appointed cabs. In all ages there has been something in the handling of the whip favorable to trickery and imposition, and a driver was always a favorite object for public anathema. With a regulated scale of payment, and accurately measured distances, there ought to be no overcharge. This is fostered, if not created, by persons who think it mean to pay only the proper fare, although it would be well for them to remember that the extra shilling or sixpence, which is nothing to them, is really a considerable tax on the slender means of others.

The taking of cab-tickets seems almost entirely to have ceased. It is certain, at least, that a driver never voluntarily offers one to his fare; and yet this delivery forms a valuable method of identification. It would be a curious branch of statistics to learn the number of small articles, such as umbrellas, parasols, opera glasses, &c., that are weekly left in cabs and lost altogether. It seldom pays to advertise them and give a reward on their being brought back, whereas the ticket at once ensures their repossession. If the ticket has fallen into disuse, its revival would seem very desirable, and might be attempted by those who are not above taking a little thought for public benefit.

Needless perplexity is caused by the repetition of numbers in some streets. Notably, there is Oxford-street. The numbers on either side of 260 occur over and over again. This seems to be nobody's business, but, perhaps, calling attention to the irregularity may induce some one to take up the matter. It is a disgrace to us that one of our principal thoroughfares should be so neglected. The names of streets have been legibly painted, with the addition of the letters indicating the postal district. So far well; but the various parish authorities might carry the notice a little further in some cases, and write up the direction in which the street leads. For example, Orchard-street corner should have "leading to Baker-street

and St. John's-wood;" Edgware-road, "leading to Maida-hill and Kilburn."

Few persons who have been abroad have not at some time or other found out the usefulness of a *valet-de-place*. He knows the principal objects of interest in a town, and the hours of the day at which they are to be seen. He hires a cab, or conducts you on foot, according as you wish to get through sight-seeing quickly or not. Here would be an opportunity of employing such persons as the Commissionaires who may be of good character, civil, and intelligent.—The rate of payment four or five shillings per day.

For those who prefer to find their way by themselves there should be a *thin* book, similar to the "Practical Paris Guide," which shows you how "to see all that ought to be seen in the shortest period, and at the least expense." A skeleton description of public buildings should alone be given, furnishing an idea of the salient features, with minute particulars of charges of admission. A tabulated statement of the prices paid for different parts of the house at the theatres, and the hours of full and half play would be found useful; for this is the kind of information difficult to get at the moment when it is wanted, and least likely to be forthcoming from any one at hand. The more remarkable churches, including the most recent, should have a brief notice. Few, even in the architectural profession, are acquainted with the Gothic and antiquarian remains in the City; and there is a general ignorance as to the burial-places and monument of celebrated persons, except those in the Abbey and St. Paul's. If the compiler would seize the points which his own experience has suggested as "practically" necessary, and endeavour to supply the wants which he himself has felt, the result would be most valuable. Some attempt might be made to unravel the mystery of distances, and to give them within main points, of which a chief one would, necessarily, be the Exhibition. It remains to be seen what arrangements will be made for dinners at the Building; but, as strangers will visit other parts of London, something might be said about "where to dine." Under this head, we fear that there will be little to praise or recommend. For its size, London is most indifferently supplied with dining-houses—not, indeed, as to number, but as to quality. With a few honourable exceptions, which might almost be told off on the fingers, they are squalid and close—places wherein "to feed and not to dine." In the majority of them, it would be anything but appetizing to inquire how it happens that joints are kept so constantly ready.

We may have another opportunity of considering more fully one, or more, of the topics here hastily run over, and content ourselves for the present with having touched upon some matters which are not unworthy of attention, inasmuch as they tend, in proportion as they are observed or neglected, to add to or subtract from the stock of reasonable comfort within reach of ourselves, as well as of those who may be induced to visit London.

DOINGS IN NEW SOUTH WALES.

In *Sydney* and its environs several large buildings, both for public institutions and for commercial purposes, are in course of erection. The labor market has been for some time favorable for building operations, but contractors are now unwilling to engage in large works, owing to the rush to the New Zealand gold-fields being likely to cause a scarcity and a consequent rise in the labor market. One of the largest buildings in progress in Sydney is the New Roman Catholic College, in the University enclosure. The foundations are all in, and a portion of the wall is up to the second story. The building was designed by Mr. Wardell, the present Colonial Architect in Melbourne, and the work is being carried out under Mr. Blackett. An extensive building has been commenced—the Destitute Children's Asylum at Randwick. A new wing, 175 feet by 45 feet, and three stories in height, and also a continuation of the front of the building, are being built. The cost of the additions will be about £9,000. The brickwork of the Sailors' Home, in Lower George-street, is completed, and the roof is being put on. There is an aspect of incompleteness about the building, owing to a portion only of the design being at present proceeded with. The works now in progress will probably be completed in the course of next month. The extension of the Australian Museum from the end of the present building to the boundary of the land adjoining the Grammar School is to be proceeded with. The new wing will be 200 feet in length by 40 feet in width.

At *Hobart Town*, amongst the city improvements which are rapidly progressing, is the new Museum of the Royal Society, which is being built in Macquarie-street, after designs by Mr. Henry Hunter; while on a site immediately adjoining the Museum the new Town Hall will be built; designs have already been called for by the city corporation. On the same line of street stands the site of the proposed monument to Sir J. Franklin, for which Parliament has voted £1,000. The new Survey Office is in progress, and the new Post Office, adjoining the Supreme Court buildings, is approaching completion.

At *Nelson* buildings are rapidly rising. There is a new Baptist chapel in Hardy-street, a hall in Bridge-street for the Young Men's Christian Association, the Teetotal Hall now building, and the Nelson club-house recently erected by Mr. Everett, 60 feet by 50, and 21 feet high, containing on the ground floor nine rooms and on the upper story nine. Those on the ground floor will be used as dining, coffee, and bed rooms, and on the upper story there will be billiard-rooms, bed-rooms, and a reading-room. A large store has been erected by Mr. Symons in Trafalgar-street, and in almost all the principal streets houses are now in course of erection. The sewer through Trafalgar-street is finished, and the old unsightly ditch is filled up.

The decennial return of the expenditure of the Victorian Government in connexion with public works and improvements shows that the total sum thus expended during the years 1851 to 1860 amounted to £2,713,129, of which sum £1,741,472 was provided from the revenue, and £971,657 was paid from loans raised for the construction of reproductive public works. The average yearly expenditure during the past five years has been £395,704, against £145,921 in the previous similar period. Telegraphic communication, it is

stated, is now established with all the principal cities and towns in the neighbouring colonies of New South Wales and Victoria in connexion with lines throughout the settled districts of this province. At the close of 1860 twenty-six stations, 529 miles of line, and 652½ miles of wire were opened. The revenue of this department is rapidly increasing, whilst the facilities and conveniences it creates are largely being availed of.

To the foregoing we may add the following from the *Engineer*:—of Assembly. The amount required to defray the estimated expenses of the Government of New South Wales in 1862 is £3,356,818, against, in 1861, £1,354,040. The increase in the amount required this year is, therefore, £2,002,778, the augmentation being in great part owing to the railway scheme and other public works in the department of the Minister of Works, which absorbs no less a sum than £1,997,184, proposed to be raised by loan. The works and railway loan is to be expended in the following manner:—Valuation of land, railway works in progress, and proposed extensions, £1,707,134; the construction and maintenance of the three main roads, and erection of bridges, figures for £160,000; public works and buildings, £65,000; and improvement of harbors and river navigations, £33,000. In the estimates for the maintenance and construction of main roads in the colony, the amount of £50 per mile has been put down, together with sums for bridges, culverts, and other special works, which amount altogether to another £50 per mile.

A new and substantial bridge at Camden, christened the "Cowper Bridge," was completed and open for traffic in the summer. The bridge at Fallbrook, on the Northern road, opened last year, has been maliciously destroyed by a gunpowder explosion. The work is being renewed by the Government. A lighthouse at Port Stephens, which is in progress under the Colonial Architect, has been advancing very slowly. The cause of the delay has been the unfavorable state of the weather. The lighthouse is to be 60 feet in height; at present the building is only up about 25 feet, and the work will not be finished before the end of the year. The lighthouse at Eden is nearly finished. The formation of the new harbour at Wollongong is proceeding rapidly, under the engineer for harbors. None of the tenders being considered available, Mr. Gibbons, who recently carried out some of the railway contracts, was appointed to superintend the work. About 9,000 yards of stone had been excavated in October, and the work would shortly be ready for commencing the new basin. Preparations have also been made for commencing the harbor works at Kiama, which will likewise be carried out under Mr. Gibbons. Temporary sheds and buildings for the accommodation of the workmen have been put up, previous to starting with the excavations.

The Minister for Works lately stated in the Assembly, in justification of the course taken by the Government in declining to give contracts where the works could be more advantageously carried on under their own officers, that while the estimate for the harbor works at Kiama was £30,000, the lowest tender sent in was £115,000, and that subsequently an offer had been made by Mr. Gibbons to carry out the work for the estimate. The works for the improvement of the Moruya river, which were contracted for by Messrs. White and Co., have been commenced. The principal work in progress at Newcastle is the continuation, both eastward and westward, of the public wharf, which already is about 1,300 feet in length, and which will, upon the completion of the contracts now taken, extend for 1,740 feet. As a preliminary step to the formation of the breakwater from the north head, a small wharf is being constructed within the harbor, where ballast will be deposited, to be conveyed upon a temporary railway to the breakwater. The sum of £5,000 has been voted for the work, and another sum of the same amount is placed on the estimates for the year. Tenders are about immediately to be invited for works for improving the navigation of the Clarence river. The total cost of the works is estimated at £117,237, but at present only £20,000 has been voted by the Assembly. This sum is about to be expended in the construction of a breakwater, 1,000 feet in length, to run from the south head in a north-easterly direction. The stone will be obtained from a sandstone quarry at a short distance from the head, and will be conveyed along a temporary railway. A weighbridge will be provided by the Government, and the contractor will be paid according to the amount of ballast deposited. A timber staging will be run out for the required distance and rails laid upon it. Ultimately the length of the breakwater is to be 2,000 feet, and another breakwater is to be run out from the north head. A suggestion was made that a penal establishment should be formed at the Clarence River, and that the works should be carried on by convicts. It has, however, been determined by the Government to employ free labor. Surveys have been made by the engineer for harbors of the Richmond and Macleay rivers, with a view to carrying out similar improvements.

CHURCH ARCHITECTURE.—The Rev. J. S. Hodgson, before concluding a recent lecture at Chester, remarked upon the glaring absurdity of some modern churches having been built in the Medieval style, with galleries so erected in aisles that the occupants could not hear the preacher's voice—blindly adopting the plans of Medieval architects and then spoiling them by awkwardly endeavoring to accommodate them to modern requirements. It must, however, be remembered that a church might be built in the purest style of Gothic architecture, without a scrap of Romish furniture about it. The chapter-house of a cathedral, in which the voice of a speaker could be distinctly heard by every one present, might be as pure a specimen of pointed architecture as the cathedral itself, and if modern architects would study such gems of art, and consider that they had to build churches in which the congregation might join in the prayers which the minister audibly utters, and be instructed, exhorted, and persuaded by the preacher, we might expect edifices to be erected fitted for the age in which we live. A Protestant congregation would not see around them miserable imitations of superstitious contrivances, but meet for the worship of God in buildings every part of which satisfied the most fastidious taste, without being offensive to the most sensitive disciple; the edifices would bear upon them the marks of unity of purpose and simplicity of design, and thus show that they were erected by men who understood the principles of their art, and were not blind imitators of the works of a former age.

NEW LIGHTHOUSE FOR THE WELSH COAST.—At a recent meeting the Mersey Dock Board decided to lease a site, on the great Ormeshead, for a new lighthouse. The cost of the edifice will be £5,000, and the annual charge for maintenance £380. Mr. J. B. Hartley, C.E., has presented a design for the lighthouse.

A FEW DAYS AT CHARTRES AND OTHER FRENCH TOWNS.*

THE circular windows in the nave afford examples of the plainest and richest kinds of pierced work; the roses in the heads of the clerestory windows, some 17 feet in diameter are pierced with good patterns in the simplest manner out of large slabs of stone; there are similar windows, but smaller and richer, in the cloisters at Leon, where the large rose in the north transept is one degree more ornate, having a graduated series of mouldings to the different openings. The west window of Chartres, over 30 feet in diameter, is still more richly ornamented; but both this and the clerestory windows look mean when seen from the interior, in consequence of the glazing having been placed so near the inner face of the walls; the west window especially has none of the noble effect of the exterior view, but looks like a set of isolated holes; and it is not pleasant to see this and the clerestory windows, where the roses are too heavy for the lights below them, so dependent on the stained glass for general beauty of effect. I suppose it would be impossible to find a building-stone of better kind than that used at Chartres, whether as regards its durability, its color, or fineness of grain; it is similar in appearance to a lithographic stone, and so tough and fine in texture as to place no limit to the minuteness of the carving. The columns in the western doorways contain strings of pellets no larger than the heads of pins, and many of them are now almost as clear and perfect as when carved seven centuries since; while those parts of the building much exposed to the touch have taken a polish like alabaster. I exhibit specimens of this hard stone and some others of softer kinds in use at Reims, Paris, and elsewhere. One kind very much used is the rock answering to our chalk, which, though with us so soft and white, is there of a good grey color, and so durable that I was frequently unable to detect in old work any signs of its having decayed away more than the flints that are embedded in it.

I believe no grand cathedral of the best age has all its towers complete, and of the same date. Reims has some fine specimens, wanting their crowning spires. Of the seven designed for Leon four are tolerably perfect, except the spires. Chartres was probably intended to have nine, in all of which only the two in the western front were ever completed. They are carried to the height of the springing of the gable, of similar general design, though, as usual in such cases, differing considerably in details (see the spires of St. Etienne at Caen, and those of the Cathedral at Bayeux). No doubt the one latest built had the benefit of any improvement suggested by the view of its senior companion; and it is worth while to notice the small amount of scruple with which this kind of thing was constantly done, as if it were by no means necessary to make a sacrifice for the sake of uniformity, even in a church without aisles, where the windows on the north side were three-lights, those on the south were made, very sensibly, in two-lights, and the difference was not so noticeable as might have been expected. Of these two spires, that on the north is of the sixteenth century, and, of its kind, handsome and in good proportion to the building. The south tower and spire, being older by half a century than the body of the church, are much too low for it, although, in themselves, a far more beautiful composition than that on the north.

Looking at the upper story of this tower, immediately below the octagonal stage, there seems to have been a careful preparation for some superstructure of a different kind to that which now surmounts it; the design of this portion is such that we might expect, at least, a short blank story before the commencement of a spire of any kind, but the arrangement of the windows and buttresses has no reference to what is to follow upon them; and the spire and octagonal stage, richer in all their details, stand with piers on the heads of the windows below, and openings close over all the lower buttresses. Still, the general outline of this tower and spire is admirable, and, in distant views of the town—from east or west, the cathedral stands out over everything very magnificently. I shall not soon forget the effect of its dark mass against the sun-rise as I left it on my way to Le Mans.

I could spend no more than part of one day at Le Mans, during which I saw, besides the Cathedral, some of the dirtiest, darkest, and most wretched holes that can anywhere be tenanted by human beings. I explored it a good deal just after a shower, unfortunately, that brought out the sickly tints and enhanced the flavour of things; it was the only time that I saw in its worst aspect the system of drainage by open gutters by the side of other symptoms of neglect and ruin. But there were a good number of picturesque and some richly ornamented fronts of houses that had seen better tenants. There are fine open spaces also, and a large and lively market-place, almost every house in which is a café or hotel. In the Cathedral, the interior view of the choir, with its double aisles and radiating chapels, was the most spacious and lightsome of any I had seen. The construction of this portion is very interesting; externally the chapels form a very pleasing group, but the forest of pinnacles rising above them with the flying buttresses, though very ingenious, have a painfully confused appearance. Here is a twelfth century portal on the south side similar to the west doorways at Chartres, and very old Romanesque work, patched with later Romanesque in the nave. The church of Notre Dame de la Coultrure, into which I could do no more than look for a few minutes, has a very peculiar twelfth-century nave, without aisles, but with large wall arches springing from the base of the vaulting shafts and enriched with ball-flower and other small ornaments: there are some small arches of brick and stone placed alternately, and very tall, stilted, round-headed arches round the east of the choir. The naves of both these churches are divided by heavy cross arches of square section into large compartments, and in each is a dome-like cross vault. This vaulting and other portions of the construction belong to a type that I did not see represented elsewhere. I should have been glad to pass a longer time there and also at Sées, which is very accurately described in "Murray" as a poor little city. There is in its cathedral much that is worth study: it has good thirteenth century chapels; its fine portico has had its statues carefully hacked away and all the foliage broken. It has been preserved from falling to pieces by new buttresses of which I sketched one rather picturesque group going round the angle of the north-west tower, rather elegant, but cold from the character of the details.

There are in Le Mans and Sées plenty of quaint figures and costumes in the streets, and, as in all the towns, I saw much life and gaiety, and much dismal country for many miles between them. In such restorations of churches as I saw, colors were being rather freely applied to the walls, and not with very good effect. With respect to the finest specimens of polychromy that I saw, that in the Sainte Chapelle at Paris, I think the painting and gilding that there cover every part of it, confusing the forms and destroying the light and shade of the orna-

ments, are much to be regretted. Still less defensible is the tricks which I saw in two or three places, of lining the wall panels with ornamental encaustic tiles, and painting upon them lines to represent the folds of hangings. The floor of the Sainte Chapelle, composed of hard grey stone, out of which patterns have been sunk and filled with colored cements, was pleasant to walk upon, more so than are ordinary encaustic tiles. There is great variety in the floors and pavements about the French towns, colored marbles in patterns are frequent in shops and entrance-halls of private houses, and the ordinary hexagonal paving tiles have a pleasant effect in many cases. I saw but one manufactory for them, and that of the rudest kind; the clay was being tempered by men's feet, and the men—it was rather difficult to say—but I think they would have been naked, but for the clay in which they were involved.

Strolling through the street there is in every day architecture much matter for observation, a general tendency towards neatness, and good taste in the arrangement of the more modern shops. I saw sometimes in lanes where only one cart could pass elegantly decorated establishments, the white and gold and the looking-glass of which would, if moved to our Regent-street, be much admired. The cafés were often very splendidly decorated; one café chantant, in which I could scarcely find a place amongst some hundreds of men in blouses, was well arranged and of a light Italian character; it might have been made exceedingly showy and vulgar by the use of a few bright colors but, being kept white with a very sparing use of gold, it was as elegant as any drawing-room. I do not say that this color would always suit our colder climate, or stand so well in our damp atmosphere, but as they were situated nothing could look better or more quietly cheerful. In one little town there were shops which had frize and dado of black marble with incised and gilt letters, and even a slab of marble attached to the lower side of the door. The handsomest shop that I saw anywhere was that of a butcher near the Madeleine, in Paris; every part of it is appropriately ornamented from the floor of colored marbles to the enriched ceiling; the marble slabs in the windows and even the blocks are cut in ornamental forms; a large fountain plays in the middle, business goes on quickly, and there seems to be much of it, and one may hope that somebody is reaping the reward of his enterprize in bringing so much of art into connexion with this least poetical of callings.

The large works of reconstruction now being carried on in Paris furnish many useful hints, especially with respect to the system of fireproof construction, a system that one would be glad to carry out more generally in London. The joists are lighter than with us, they are readily put together, and the workmen execute the brick filling-in roughly and quickly, and they cut and trim them to any variety of plan with great facility.

Three stout rolled girders strapped together form sufficient bressummer for the ordinary spans used in shop-fronts, and flat arches in stone are turned over narrower openings, with sometimes stout iron bars passing through them.

Any one studying iron construction and workmanship will find plenty of matter, especially in the lighter kinds of work. The roofs of the railway stations along the line to Strasbourg are good specimens of flat girders in very light angle and T iron. The station at Le Mans has a trussed roof of very good ornamental character; the putting together and finishing generally are very neatly executed, and they probably remain longer uninjured by rust than in our climate. On this point, however, the most interesting matter I saw was the coppering of the fountains and lamp columns in Paris; there seemed to be a good thickness of metal deposited, and if the expense is not too great, we may hope that the rust, which is the chief objection to the employment of ornamental ironwork, will in future be prevented. I think Leon seemed to have more of the workers in iron than most places, but in every town, I was always coming within sound of their files and hammers. Many articles, such as we usually get from Birmingham, seem in these French towns to be home-made, and I think there is great advantage in having workmen accustomed to the finer kinds of ironwork always at hand, as the architect can have his designs carried out under his own inspection, and study its effect as it proceeds.

The tools with which the masons work the grey chalk stones and oolites are quite different from those in common use with us. How far this arises from differences in the texture of the stones you can judge from the specimens. Much work is done with the toothed axe in hewing the blocks roughly into shape and working the faces; the "clustered pick" beats the face and mouldings to something like their finished forms, and they are then finished with the plane or rubbed with a kind of grater. Where I could judge at all I thought the work was got through rather quickly, and I felt some surprise that one or two of these tools are not used in London; I have been told, as to one of them, that "the Union" has forbidden its use amongst the soft-stone masons, but I hesitate to believe anything so monstrous. Usually, all mouldings are wrought after the building is finished. I frequently saw houses intended to have elaborate fronts, some portions of the carvings had been executed as patterns some years back, and the remainder was left to be finished at another time. Generally, the beds of stones were not very finely wrought, and they were set in a rather thick layer of mortar. I think there is often an advantage in this, as in very plain buildings it is a pity to spend money in making every part neat and smooth, which will only render the poverty more apparent.

I usually contrived to spend an hour in the public libraries and museums with which the towns are furnished. At Chartres, which has 18,000 inhabitants, there are three rooms and corridors filled with pictures, antiquities, and objects of natural history, very well exhibited. They were always very easy of access, and I could not help calling to mind one or two museums I know of in fair sized towns, where I, a passing traveller, have discovered with difficulty that I could in no wise see their case of dusty birds and their barrow-load of uncatalogued minerals, except on payment of sixpence—next Tuesday. But some of our towns are making efforts to establish good museums, and I should think they will find them most valuable to themselves, and send the stranger away with a pleasant impression of their civilisation, liberality, and old associations.

I think many of us find the opportunities of studying English Medieval architecture, for a few days at a time, occur rather frequently, and on those rare occasions when we can get from town for longer periods wish to see something of continental architecture. I may state, for the information of such as wish to know, that I found the difficulty and expense of travelling much less than I anticipated. There is great regularity in the style of living, if you fall into the ways of the people. I generally stayed at the best inns, lived as expensively as the best of the people with whom I met, never disputed a bill, nor had reason to think I ought to do so, and I am sure that a tour in England would have cost me more money. If I may judge from a short experience, I should say there is no place

* Continued from page 1016.

on earth where you may go about under less fear of restriction while you are careful to avoid interference with the service of the church or any other cause of offence. The ecclesiastics seemed to take a pleasure in giving such information as they could, and when there was a regular official appointed for that purpose his fee was small. There seemed to be no objection to one's going anywhere for the purpose of sketching. I was now and then invited into private gardens for the sake of getting a better position. Ordinary passers-by generally apologised if they were compelled to obstruct the view, and nobody felt any delicacy about looking over the drawing or attempting to read the notes, but it was done civilly, and I think was intended as a compliment.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.

DR. DRESSER ON THE ART OF DECORATIVE DESIGN.

THE second lecture by Dr. Christopher Dresser, of Hammersmith, on the "Art of Decorative Design," was delivered before the Society for the Encouragement of the Fine Arts, on Thursday evening, the twelfth ult. There was a numerous attendance, and the chair was occupied by Mr. HURLSTONE. After referring to grades in decorative art, and in illustration of his subject, the Lecturer said:—

I suppose that the object which we have in teaching writing in our schools is that of enabling mind to communicate with mind, and spirit with spirit, when the bodies in which they dwell are somewhat widely separated by space or time; the secondary advantages—resulting from an increase of power over the hand and a more careful mode of thought, which writing induces—may also lead us to infill this task of learning to make and arrange characters on paper upon our children; but the primary object is that of enabling them to pass their thoughts through space, and hand them down through time in order to instruct, gratify, or delight kindred spirits. But the power to write is only of value as it enables us to embody thought in form in such a manner that others may reap from the forms the conceptions of the mind which created them.

In itself the power is worthless, for no collection of indiscriminately arranged words, I conclude, would be of value; but as thought can be conveyed by this agency, the art cannot be overestimated.

The works of Shakespeare, Macaulay, and Bacon we greatly value, but they neither command our sympathies nor approbation because they are combinations of characters arranged in meritorious order according to rule, but through the excellency of the mind which they make known, for, while reading these works, we recognize the minds of the authors conversing with our minds as fully as if the very men were standing before us in person, and speaking in audible sounds.

It is so with drawing, for this is only a vehicle for thought—a means to an end; and I know not that the art is worth the expenditure of labor necessary to its possession, but for this one power which it has. Writing may be said to be a plain chariot in which thoughts are conveyed from individual to individual throughout a kingdom, and sometimes beyond; and decorative art, an ornamented car in which mind is conveyed throughout the world. One feature of especial interest as appertaining to drawing is this, that the language which it speaks is universal, and addresses itself alike to the inhabitants of every land. Then, however desirable it may be to possess the power of delineating objects for secondary purposes, the great value of such ability rests in the increased means afforded for the conveyance of thought. Seeing that we value the power of drawing merely as a means and not as an end, and recognising the truth already enforced—that the amount of pleasure derivable from an object is in ratio to the amount of mind which it manifests, it will not be difficult for us to determine the merits of the varied classes of decorative art.

Mere imitation is not ornamentation, and is no more art in the higher sense of the term than writing is in itself literature, for in order to the production of ornament there must, at least, be adaptation.

Our so-called natural wall papers will illustrate the first, or most elementary, step taken towards the production of ornament, for adaptation has here been considered so far as is absolutely necessary in order that the design may repeat in the mechanical manner necessary to its production, but no further. Here, the effort has been to imitate what is seen, and not to adapt natural forms to the purposes of decoration; the little adaptation essential is rather mourned over than joyed in, and had it not been indispensable would not have been considered.

If mere imitation is ornamentation, the ornamentist must at once give place to the photographer, for his art repeats natural objects with infinitely more accuracy than the most careful draughtsman; but photography cannot invent ornaments as it is devoid of the mental or imaginative faculty, for the working of the mental power is essential to the production of decoration, and, indeed, to the creation of all exalted art.

We have no reason to believe that when the old Greeks were about to produce one of their inimitable statues, they searched the land for the most perfect human form, and simply imitated what they saw; if so, they would have made a cast of the figure: but their statues are not casts; they are types of the human shape, and unquestionably resulted from a consideration of the form of many individuals. I imagine that prior to the production of one of these statues, an enquiry was made into the perfect form of the human body, which investigation might be long continued, and require the observation of the forms of many; and after the mind had produced to itself, in the form of a mental conception, a perfect type worked out in all its details, an enquiry was further instituted into the modification which the form underwent as the action of the figure was brought to that required. After such preparation the production of a figure perfect in form was comparatively easy; the difficulty rested in formulating correctly the mental image, and in order to this the great knowledge was required. What we admire, then, in the Greek statue is not the manifestation of mechanical skill or labor in its construction (indeed, no thought of labor is intruded upon the mind when beholding it), but the knowledge manifested by it, and we view it with delight as the embodiment in matter of a conception of the mind.

We see that perfect works of art are not imitations of that which actually exists, but are mind embodied in form, and this is emphatically the case with ornament, for that which is most pleasing and meritorious is that which has most fully mental origin, while that which sets forth things seen is of a less satisfactory character.

Natural adaptations, we have seen, are the lowest form of decorative orna-

mentation, but the next step, which is much more exalted, consists in the "conventional treatment" of natural forms.

Vegetable nature, which is alone the type of ornament, treated conventionally, will not be found to be far removed from truth, but will be merely a natural form, or a series of combined forms, neither marred by blights nor disturbed by winds, adapted to the fulfilment of a special purpose, or suited to a particular position, for the most perfect examples of what is usually termed "conventionalised nature" are those which express the intention of nature, if we may thus speak, or are manifestations of natural objects, as undisturbed by surrounding influences and unmarred by casualties.

In attempting the production of the ideal of nature, the utmost care must be used in order to discriminate between truth and deformity; the beauty of a plant cannot be said to be repeated in a drawing, if deformity alone is portrayed; indeed, deformity must be altogether absent from a perfect work, for art has a more exalted mission than that of setting forth what we loathe.

How repugnant to refined feelings it is to behold a marred feature or disfigured limb perpetuated by statuary as a work of art, and although deformity in plants may not be so manifest, and hence not so offensive, as deformity in man, yet its presence detracts from beauty, even if the source of the evil be unperceived.

Conventionalised nature, we say, will be found to consist in the delineation of nature in its purest or typical form; hence it is not imitation, but consists in the embodiment in form of a mental idea of the perfect plant; but this ideal figure is subjected to a process of adaptation.

The intention of the plant in producing the bud of the honeysuckle is that of developing leaves of certain shapes in a given arrangement while they are yet varied in direction; but should a leaf be partially destroyed through blight or some insect preying upon it, it will be necessary to perfect it; and should the leaves on one side of the stem be smaller than those on the other, owing to their receiving an insufficiency of light, they must be enlarged; or, should any part be drawn aside from its proper position, it must again be restored to its place. And in thus deducing from many examples the laws and forms of nature, and producing a truly typical shape, rests the chief secret of the production of the conventional forms of plants.

Still following an ascending series, we find the next grade of decorative art in the embodying in form a mental idea which has been suggested by nature, and yet the ornamental forms are neither a representation of any actually existing form or of any intention of nature.

The illustration already given of the manner in which a mental conception can be embodied in a new form, as that of an opening bud or of a flower, will likewise tend to elucidate our present meaning; and it will be unnecessary that we spend time in showing that a composition may embody an idea derived from a natural object and yet not imitate the object the spirit of which it embodies, for we have before seen that this is possible.

It is apparent that the latter class of ornament is a greater development of mind than either of those which we have already considered, for in the "natural treatment" there is the smallest possible amount of mental power embodied, and although in conventionalised nature there is much more, yet there is considerably less, than in the embodiment of a mere feature in ideal form.

Purely ideal ornament is that which is most exalted, it being wholly a creation of the soul; it is utterly an embodiment of mind in form, or an offspring of the inner man, and its origin and nature give to it its elevated character.

It would be a folly now to enforce the statement that conventional ornament is the highest branch of decorative art, as we have shown that the exaltation of ornament is in ratio to the amount of mind manifested in its creation, and the most careful consideration will verify this truth; for ideal creations are as far above imitations as the mind is above the brute—many brutes can imitate, but they cannot create.

We are now enabled to classify ornaments by affinities resulting from equality in respect to the embodiment of mental power. Thus we have as examples of the first, or most exalted, grade of ornament, the Greek, the Moorish, the Early English, much of the Indian, many features in the Japanese, and some parts of the Egyptian and Renaissance. In the second class, following a descending series, we may instance much of the Egyptian and Chinese, and a few features in the Greek and Japanese. In the third a great portion of the middle-age work, especially the later Gothic, and many parts of the Chinese or Indian; and in the fourth or last class, much of Pompeian and our modern floral patterns.

While we have thus instanced a few examples which seem, on the whole, illustrations of the grades to which we have called attention, yet in several cases the same part of a decoration will by two features illustrate two grades. Our own floral patterns, while they belong to the fourth or lowest class in view of their composition, belong also to the first or second class in view of their coloring, for it is in some parts purely ideal, and in others nearly suggested by natural objects; and, were it not for the more exalted character of the coloring, these patterns would be much coarser than they are.

While there are these grades of ornament, it must also be remembered that there can be good and bad in each class, for if a purely mental creation has not its parts subjected to the laws or requirements of ornament, which we have yet to point out, it cannot be satisfying, and the pain resulting from beholding an imperfect ornament will be in ratio to the class to which it belongs, and will be greater as the class is exalted. Purely ideal art, when degraded, is most offensive, as it is the nobler part of man so debased as to be contemptible.

The lecturer then referred to plants as furnishers of ornament, and pointed out the manner in which a plant grows. Every plant at first consisted of but one body, a cell, and however long that plant might grow, and to whatever extent it might be developed, it was but a multiplication or repetition of what it first appeared. He then referred to length to the horse chestnut, showing how by growth the plant had been repeated and multiplied. A flower was only a very short branch with leaves springing from it, but those leaves were modified in color and character to perform the particular work which they were destined to fulfil. We saw that plants had repetitions, and so it was in fine art, as might be witnessed in the kaleidoscope, where the pleasing effect was produced by repetition according to rule. Repetition was essential to the production of ornament. He then referred to diagrams of the *begonia* and *petunia*, showing how they repeated their parts. After referring to the repetitions in *mignonette*, the lecturer remarked that alternation was essential to the production of ornament, and the object answered by this alternation was calling attention away from the junction

THE NEW MIDDLE TEMPLE LIBRARY.

1. The first part of the paper is devoted to a general discussion of the problem. It is shown that the problem is of great importance in the theory of the differential equations of the second order. The problem is to find the general solution of the differential equation

$$y'' + p(x)y' + q(x)y = r(x)$$

where $p(x)$, $q(x)$ and $r(x)$ are functions of x . The general solution of this equation can be found by the method of variation of parameters. The method consists in assuming a particular solution of the form

$$y = u(x)y_1(x) + v(x)y_2(x)$$

where $y_1(x)$ and $y_2(x)$ are two linearly independent solutions of the homogeneous equation

$$y'' + p(x)y' + q(x)y = 0$$

and $u(x)$ and $v(x)$ are functions to be determined. The method of variation of parameters leads to a system of two linear equations for $u(x)$ and $v(x)$. The solution of this system gives the particular solution of the inhomogeneous equation. The general solution of the inhomogeneous equation is then obtained by adding the particular solution to the general solution of the homogeneous equation.

of lines. Passing over symmetry, Dr. Dresser proceeded to the consideration of adaptation. There was a perfect adaptation of the flora to the earth on which it rested. Adaptation in nature might be shown in almost every flower. In the case of decoration it was all-important to consider adaptation as a primary feature. On this point he referred to the forms of the Egyptian and Greek water vessels. It was a peculiar prerogative of art to take hold of a pleasing feature and to possess it; we had to decorate and beautify, but we had to take hold of a pleasing feature and to beautify that. The lecturer passed on to speak of the power of ornament to express ideas with the aid of symbolism, and to argue of the possibility of embodying thought in abstract ornament, in conventional forms, which he illustrated at some length. All the ornamentist had to do was to make the mind create a certain thing.

The lecturer on resuming his seat was warmly applauded by the meeting.

The CHAIRMAN (Mr. F. Y. Hurlstone) moved a vote of thanks to Dr. Dresser for his excellent and elaborate lectures, in which he had entered into details of great interest in regard to decorative art. The motion was seconded and carried by acclamation.

The meeting then broke up.

THE GEOLOGY OF THE ISLE OF PORTLAND.*

WE are glad to see that Mr. William Gray has had reprinted his interesting paper on "The Geology of the Isle of Portland;" a considerable portion of the information given is of great value. It is shown that—

The series of strata, though not everywhere exhibited together, yet when grouped as a whole afford a vertical section of about 525 feet; hard rocks of a light color giving about 145 feet; dark brown sandy deposits about 45; and the Kimmeridge clay formation the remaining 335. The slides, which to the east and west present bold fronts to the sea, have been much effected by landslips.

The sections of the various strata are shown in a woodcut, beginning at the top they are—

Belonging to the Purbeck series.	Sand and gravel of the Raised Beach.
	Calcareous slate, 8 to 30 feet thick.
Portland Stone.	Clay band.
	Bacon tier, 1 to 1½ feet.
	Clay band, 8 feet.
	Aish, 3 feet.
	Soft burr, 1 foot to 14 inches.
	Dirt bed, 1 foot to 16 inches.
	Top rising, 2 feet.
	Cap, 4 to 7 feet.
	Seam of black earth.
	Skull cap, 20 inches to 3 feet.
	Roach, 3 feet.
	Whit-bed, 9 feet. (The really best bed of stone.)
	Curf and waste, with chert beds, 6 feet.
	Roach, 1½ to 2 feet.
	Base bed or lower tier, 5 feet. (Called also the "Best bed.")
	Limestone and chert, 75 feet.
	Blue clay 2 to 10 feet.
	Portland sand, 45 feet.
	Kimmeridge clay, with septaria, 335 feet seen.

The Portland sand, next above the Kimmeridge clay, and into which it gradually merges, is made up of layers of an olive-green-colored limestone, divided horizontally by sandy beds, the mass being shattered and broken. So unshapely are the blocks of which the layers are composed, that if it could be conveniently quarried, it would be unsuitable for building purposes. Some of the beds are soon destroyed by exposure to the weather; but others are comparatively unaffected, and the exposed surface becomes covered with lichens, as may be seen on several of the overturned blocks on the north-west slope. The thickness of the Portland sand is about 45 feet.

Occupying an intermediate space between the Portland stone proper and the Kimmeridge clay, the Portland sand may be considered the transition series, but notwithstanding this graduated development of the solid Portland beds, it is not easy to comprehend how it comes to pass that they overlie a formation very little altered at present from what we should suppose the Portland stone beds were when first deposited. What consolidated the Portland beds? If pressure produced the effect, why should the clay below remain unchanged? In the Portland sand, like in the overlying strata, are found fossil casts of ammonites, trigonites, &c.; it might have happened that the shells decomposed as they lay in the original silt or sand, and that the carbonate of lime thus supplied was taken up by water, and distributed throughout the strata, and again crystallising, consolidated the mass interposed between the beds of clay, the latter, by its impervious character, preventing the filtration of the water.

At the Vern Ditch (in connexion with Portland defences) a most favorable opportunity is afforded for examination and study. This cutting, when finished, will, in the aggregate, make up a length of 1,100 yards, by in width 100 feet, and in depth from 30 feet to 75 feet. From this, the enormous quantity of 1,073,000 tons must be removed. The excavated material is used in constructing the breakwater now in progress, under the Admiralty, in Portland Roads.

The first thing that strikes the visitor in this excavation is the extraordinary regularity of the strata; a narrow bed of stone between layers of chert can be traced for a long distance, and many of the beds as developed here can be recognised again on the cliffs on the eastern and western sides of the island; some beds are subdivided, and again united within a short distance; one bed in particular, showing a thickness of 14 feet at the eastern entrance to the ditch, is subdivided within a short distance on that face into several beds.

The general thickness of the beds of stone is from 2 to 5 feet, and the cherty beds vary from 6 inches to 3 feet. Sometimes the chert runs from one layer into another, and very often the veins in the bed of stone between two layers of chert are filled up with chert also, so that it looks on some sections like vertical, or almost vertical, markings made with a tar-brush. The horizontal beds of chert, where a fresh section is opened, appear almost black, and contrast strongly with the light color of the intermediate beds of stone. This difference of color is soon mellowed down by the growth of lichens and other vegetation. Some of the cherty layers are made up of shells, and in the upper beds of this series cherty nodules are not uncommon, which, when broken, show a shell in the centre. These nodules vary from the size of an egg to the size of a heavy cannon-shot. In the lowest beds the chert is in irregular patches, as if collected round a branched nucleus, and a section shows a number of parallel lines from the centre to the surface of the mass, disposed in concentric rings.

The beds, so remarkably regular, and almost horizontal in the cross section, suddenly dip at a considerable angle (30 degrees) on the east and west faces. This seems to have been caused by slips parting in the direction of fissures, and becoming thus tilted over in the direction of the slopes already described. The ditch in one direction, on the west face, is cut through a slip of this kind; and on the east face the tilted nature of the strata causes a difficulty in forming the contemplated perpendicular escarpment. This phenomenon, manifested also in other portions of the island, was evidently caused by the wearing away of the underlying clay and sand, the destructive effect of which was promoted by the existence of the fissures.

On the Vern Hill—which is a comparatively level space of about 50 acres, at the northern end of the island, bounded by the slopes described at the beginning of the paper—

The Base-bed has been quarried to a limited extent; but, as might be expected from its geological position, the quantity was scanty and of inferior quality; for in Portland the beds, whether they merely crop out by running with a quicker dip than the fall of the surface, or run parallel with the surface, in either case, are very much broken and shattered for about 8 or 12 feet from the surface. The Base-bed, in this shattered condition, extends over the greater part of the Vern Hill. It runs out to the south as it approaches the ditch, and from about 200 feet at the other side of the ditch, where it again crops out, it continues all over the island.

The local term "Best-bed," as applied to the stratum now under consideration—

Has caused no little confusion and disappointment; for, though it possesses the finest texture and the most uniform color of any bed on the island, it is not really the best for many of the purposes to which it is at present applied; it is liable to rapid decay when exposed to the weather; but, being soft, it is easily and economically sawn into any size, and therefore meets with demand in the market. There can be no objection to its use for inside work, where it answers admirably, and the wonder is, that it is not oftener so employed; but, for outside work it is ruinous. The misapplication of the term "Best-bed," and the injudicious employment of it for works exposed to atmospheric influences, had created a considerable prejudice against it, and many thousand tons that should have been quarried in Portland are left behind, and covered up in the debris quarried from the other beds. The term "Best-bed" may be a corruption of the term Base-bed, the latter being most correct when applied to what is commonly called the Best-bed, for it is the base, or lowest bed quarried in the Isle of Portland. It is very uniform in its texture and color, free from fossils, and may be had in any reasonable sized blocks, not more than 5 feet in one direction, this being the average thickness of the bed.

Overlying the Base-bed, and closely associated with it, there is a bed of "roach," from 18 inches to 2 feet thick.

Between the roach of the base-bed, and the Whit-bed, or really Best bed, there intervenes a bed, or beds, called by the quarrymen "curf," and "waste;" this is divided from the underlying, as well as from the overlying beds, by layers of chert, and is often subdivided by similar layers; the quality of the stone, too, varies considerably, and is never fit for particular work.

Next above the curf is the Whit-bed, or the true Best-bed of Portland stone.

The local term Whit-bed is a misnomer, and like the term Best-bed, as applied to the lowest bed, leads to confusion; for Whit-bed, in contradistinction to Best-bed, implies that the former is whiter and second in quality to the latter, whereas, in reality, the Whit-bed is the darkest and best, and (what is called) the Best-bed is the lightest and worst.

Architects should carefully note those distinctions. The texture of the Base-bed differs from that of the Whit-bed, in that the former is comparatively free from fossils, whereas the latter contains a great quantity of comminuted shells, the fragments being just small enough to impart a light brown tint to the stone, without giving it a speckled appearance.

The durability of this stone, as compared with the Base-bed, may be occasioned by the quantity of crystallised carbonate of lime by which it is impregnated, derived from the contained shells. The centre of the Whit-bed proves the best for exposure to weather, inasmuch as the top, and more particularly the bottom, of the bed is much softer. A knowledge of this fact is necessary to the proper disposal of this stone in architectural works, and to counteract the injurious effect of the workmen's practice in dressing the top or bottom of the bed for the fine or exposed surface. The Whit-bed is generally about 9 feet high, and is necessarily split up into smaller blocks before it leaves the quarry. When a block, the full height of the bed, is parted in the centre, two stones are produced, each of which has a hard and soft face, the hardest being that part nearest the parting joint, and the softer, the parts next the top and bottom of the bed respectively.

When a mason is given one of these stones to work, he selects the softest part for the face, taking the least amount of labor to produce the more particular surface required; the result must, therefore, be to the disadvantage of the stone. Whereas, had the centre portion of the original block been selected for the face-work, the result would be more durability, as well as uniformity of color. The foregoing observations apply more particularly when the stone is laid square with the direction of its bed, and not "on its natural or quarry bed," as is generally specified, and, indeed, most necessarily so, when the stone is of a laminated or fissile structure; but with Portland stone, for the reasons stated, it is questionable whether any advantage would be derived from insisting on laying the blocks on the quarry-bed; it would require constant, untiring supervision to secure the fulfilment of such a condition, and very few, except the practical workman, can detect in some blocks of Portland stone which way the bed runs, unless by the difference in quality between the centre of the layer and its top and bottom; and when this difference is apparent, it would be, indeed, unwise to enforce the above rule, viz., "that every stone should be laid on its natural or quarry-bed."

The quality of the Whit-bed—like all the other beds in Portland—varies considerably; for example, in one part of the Admiralty quarries it is exceedingly rough and frothy, containing numerous shells and white spots of a calcareous substance; the latter crystallised in concentric rings; whereas, in the same quarry, nay, even at the other side of a joint or parting, the stone assumes its usual fine and uniform texture. It would be needless attempting to account for this phenomenon, but such is the fact.

Generally speaking, the beds produce the best quality of stone northwards. At the north-west, both Whit-bed and Base-bed are of excellent quality; farther south, the Whit-bed reaches its highest degree of perfection, but the Base-bed falls in quality; at the south-west both are inferior. On the east side of the island the Base-bed is very good, and the Whit-bed is coarse and shelly; both beds are again deteriorated in quality southwards. The same difference in quality may be noticed in the curf and roach. The former may sometimes be found almost equal to the latter, but, as a rule, the distinction between curf and roach should always be observed, and the former never put where roach is intended, particularly in exposed situations, as sea-walls or docks.

Overlying and closely associated with the Whit-bed is the celebrated Roach, a local term applied to a layer of about 3 feet thick, made up almost entirely by casts of various shells, such as a *Cerithium Portlandicum*, *Trigonia incurva*, *Trigonia gibbosa*, *Neritoma sinuosa*, *Pleurogonaria rugata*, *Lucina Portlandica*, &c. This is the only bed in which "the screw," or *Cerithium Portlandicum*, is found, and here it is in the greatest abundance; not a fragment of Roach can be picked up without some portion of this shell; so thickly are these casts crowded together, that they frequently run one into the other; it is not uncommon to get a *Cerithium* in the cast of a *Trigonia*, or the cast of a small *Cerithium* in another. All the fossils of the roach, except the *Ostrea expansa*, are merely casts, not a vestige of the original shell is left, nor is the space it once occupied filled up by any calcareous matter; a clear space is left round the cast; it is this circumstance that gives the stone its spongy or aërated appearance.

For durability the Roach cannot be surpassed, yet, notwithstanding this latter quality, it has not heretofore met with much favor in the market; hence thousands of tons quarried and squared up, have for many years been left lying about in all directions in the quarry-heaps, and hundreds of tons more have been covered up in the quarry debris or "tipped" over the western cliffs; latterly, however, it has received more attention, and it is now beginning to be extensively employed on large works of all kinds where its roughness is not an objection; for docks, sea-walls, heavy abutments, or bridges, it answers admirably.

In selecting even this bed for building purposes, care must be taken that no portion of the Curf-bed, or even the Roach of the Base-bed is substituted; for, unlike the Roach proper, neither of the latter will stand the weather, nor are they by any means as strong

* "On the Geology of the Isle of Portland," by WILLIAM GRAY, Esq., Royal Engineer Department.

as the best Roach. Though very much alike in appearance, the good Roach is easily distinguished from the others by its darker color; it is more siliceous, and the cast of the *Cerithium Portlandicum* is peculiar to it.

The Roach-bed is, on an average, about 3 feet thick, and blocks of almost any lateral dimensions can be procured from the quarries; blocks are sometimes raised containing so many as twenty tons. The bed is made up of three layers; the lowest is rather compact and close-grained, resembling the underlying Whit-bed. In the west quarries this lowest division of the Roach contains the peculiar white, cylindrical crystallisations noticed in the rough Whit-bed of the Admiralty quarries. The centre division is that which gives the Roach its peculiarity, being made up (as described above) of numberless casts of shells; the upper and smallest division of the Roach is rather laminated, and resembles, in a faint degree, the calcareous state of the overlying beds; these three divisions are not easily divided, they are all closely combined in one mass. It is remarkable that the Roach-stone will not cleave readily in the direction of a plane parallel with the bed, or line of deposition. The quarrymen invariably cleave it in a direction square with the bed, and the fracture thus produced is uniform and regular, whereas, if the stone were split *with* the bed, the fracture would be irregular and wasteful.

The Roach is the most recent formation of the Portland series; immediately above it comes the first bed of the Purbeck; but between those beds, and more particularly attached to the Roach, there are irregular patches of flints, full of shells; in the upper surface of the flints the shells are especially well preserved. The variety of shells here discovered is very great, from the large oyster and pecten to the smallest cyrena, but it is difficult to detach perfect specimens, owing to the refractory character of the flint; polished specimens, and pebbles from the beach composed of it, give very good sections of the shells which it contains.

The next bed above the Roach is the "Skull-cap," so called from its position with regard to the Roach; though thus closely associated, they are essentially different, the Roach being of marine origin and belonging to the Portland series, and the cap of freshwater origin and belonging to the Purbeck series. The skull-cap, which is one division of the overlying cap, is, like the latter, most irregular, and, as to shape and texture, has no constant thickness; for example, the skull-cap, in one part of a quarry may be only 20 inches, and within a short space it may swell out to a thickness of 3 feet or more; the overlying cap, taken together with the skull-cap makes up a deposit having a total thickness of from 9 to 12 feet; the irregularities of the upper surface of the skull-cap corresponding with the uneven bed of the cap, the ridges of the one fitting into the hollows of the other; but they are divided by a layer of black earth, resembling the Dirt-bed, and which occasionally, like the latter, contains cyceads. In the cap there are circular perforations of about 4 inches in diameter; they resemble very much the holes drilled for blasting, were it not that the stone for about 10 inches all round the hole, differs materially in its texture from the main block, being vesicular and porous, and seems as if some crystallisation had taken place around some substance once occupying the now vacant space; this appearance is the more remarkable in the cap otherwise compact and close-grained, not even presenting the oolitic structure. The upper portion of the cap is more laminated than the lower, and about 2 feet of it is easily separated from the top; this thickness is called the "top-riding."

Immediately above it there is a bed about 12 or 14 inches thick, called the "soft burr." It is used in the island for building dwelling-houses, which its soft porous nature causes to be exceedingly damp.

It is from this that the sand used for building purposes on the island is obtained, thousands of tons being used on the extensive works in progress on the Vern Hill. There are no remains of shells, or other organic body, found in those sand and gravel pits, but on the east side, and north of both lighthouses, to the edge of the cliff, there is another deposit of a finer description, which is full of shells and roots of plants; one layer, of about 7 inches thick, is composed entirely of shells in a perfect condition, and where they are exposed in section they are conglomerated together like the pebbles of the pudding-stone. Thousands of these shells can be gathered in a few minutes. The deposit is about 40 feet above the level of the sea.

Geologists and architects are alike indebted to Mr. Gray for his researches.

DWELLINGS OF THE OPERATIVE CLASSES IN EDINBURGH.

AT the annual general meeting of the Architectural Institute of Scotland, Mr. J. D. Peddie in the chair, Mr. David Cousin read a paper on "The Present State of the Dwellings of the Operative Classes of Edinburgh," a topic suggested by the late calamity in that city.

It appeared that nearly one-half of the whole number of houses in the entire city are of the poorest description, and are rented at sums not exceeding £6 per annum. The total number of dwelling-houses may be stated in round numbers at 32,000; of this number there are 20,335 at and under £10 of rent, 15,163 at and under £6 of rent, and 12,747 at and under £5, and 9,076 below £4 of rent. We have thus the enormous number of 15,163 houses at and under £6 of rent—a large proportion of which are huddled together in the old "lands" of the High-street and Canongate, and adjacent wynds and closes, many of these towering to the enormous height of seven and eight stories above the street. These tenements, or "lands," were originally built as the town residences of the gentry of their day. Each flat, consisting in many cases of eight or nine rooms on a floor, was occupied by a single family; in many cases the upper floor and attics were occupied as one house; sometimes two floors were occupied by one family, having an interior staircase. Those houses are now diverted from their original use and converted into houses for the working classes, and in many cases of a still poorer class of tenants—each separate room forming a separate house for a whole family. In many cases you have 16 or 18 families all entering their several dwellings by one narrow turnpike stair, dark and dilapidated, the steps worn, and not more than 3½ feet wide. The rents for such apartments vary from 1s. per week to 1s. 9d. or 2s., according to the size of the apartment. In one land which I visited lately, I found 56 different families all entering their separate dwellings by one common stair. From a statement supplied to me I find that in 1858 a survey had been made of this land, when it was found that there were 59 families in 79 rooms, and 224 inmates, of whom 54 were men, 78 were women, and 112 were children. This vast tenement is six stories in height, besides the attics, and to none of all these 59 families had water been supplied, nor soil-pipe nor water-closet, nor other necessary conveniences of any description. All water for domestic purposes had to be carried from the public well in the street up to the highest house, and all soil had to be carried down to the water channel in the street. Only think of 59 families in one stair! and that stair situated at the foot of a cul de sac 5 feet wide, surrounded by tenements 45 or 50 feet high! Think of the population of a whole village crowded into a single staircase—their houses destitute of the means of personal cleanliness or sanitary arrangements. It is bad enough for the adults; but what shall we say for the 112 poor children, many of whom I found sitting in little groups on the steps of the dark chilly unwholesome staircase or congregated at the mouth of the close on the public thoroughfare, subject to the contaminating influences of the foul air arising from the water channels where the night soil is thrown out to be removed by the scavenger in his weary rounds of his barrow, in unceasing efforts to keep up surface cleanings. Such scenes as these are but specimens of what is everywhere

to be witnessed, and it is such scenes that have given our old town such unenviable notoriety.

Referring, then, to the physical and moral effects of living in such dwellings on young and old of both sexes, the speaker proceeded to consider where to find a remedy, the first object being to secure the erection of additional dwellings, so that the overcrowded portions of the city might be opened out.

The best method of securing success would be for the working men themselves to take this all-important matter into their own hands. Could they only be persuaded to take up the question of providing house accommodation for their families, it would be one of the greatest means of social advancement that has yet been attempted. They know their own requirements better than any other class of men, and he idea of workmen associating together for this object is not new. In the year 1826 a co-operative society was formed in our own city, consisting of forty-eight members, joined together for the purpose of providing houses for themselves. This object they accomplished in the course of seven years, during which period six separate tenements were erected, with eight houses in each, being one house for each member. This property is situated in Canning-place, Causewayside, and is to this day a fair specimen of what workmen's houses ought to be. The plans were prepared by one of themselves, another took charge of the weekly subscriptions, and the whole affair was managed without expense. The committee of management contracted for the erection of the building in the ordinary way by competing estimates. The entry-money, I understand, was £5, which gave a small capital to begin operations. The weekly contributions of 2s. from each member helped the stock, and after the buildings were advanced to a certain stage money at the ordinary rate of interest was easily procured. Each house consists of a room, kitchen, light bed-closet, and two dark closets, with water supply, soil-pipe, sink, and water-closet. The cost of such houses at that time was only about £80. Wages were low and building materials cheap. The association I refer to, as has already been said, commenced in 1826. The wages in that year for joiners were 18s. per week; in the following year they were 14s. Yet with such low wages forty-eight industrious self-denying men were found with firmness of purpose sufficient to enable them to conduct this scheme to a successful issue. House rents, I understand, were rather cheaper during the period I have referred to than now; clothing was quite as dear then as now; some articles of food were much higher, as tea, for example, which at that time was 6s. per lb. The wages of the joiner now averages 22s. per week; that of masons, at the present time, is 5½d. per hour—which, for sixty hours per week, the length of time during which they worked at that time, gives a wage of 27s. 6d. per week, or, at fifty-two hours per week, as now arranged, a wage of 23s. 10d. per week, or fully one-half more than their brethren of thirty years ago. If industrious working men in those days could spare 2s. of weekly contribution towards the erection of dwellings for their families, surely it would be no great stretch of self-denial in their successors, now so much better paid, to follow their example and contribute a like sum for this noble object. The intelligence of the operative classes now is quite equal to what it was then, and they are much better accustomed to co-operation in securing a common object. Amongst their number there are men enough of skill, energy, and force of character sufficient to conduct such operations to a successful termination. It had occurred to me that those Property Investment Associations, set afoot some twelve or fifteen years ago, must have been the means, as it was the avowed object, of enabling working men to secure houses for themselves to a great extent. This I fear has not been the case. On inquiry at the manager of one of the largest of those companies established thirteen years ago, I find that it has advanced during that period to its members for the purchase of property no less a sum than £236,000. Of this large sum not more than £5,000 has been advanced to journeymen tradesmen, or clerks with corresponding wages, for the purchase of houses for their own occupancy in Edinburgh. Small tradesmen and journeymen have availed themselves of the facilities which these companies afford of getting money, and have purchased house property of an inferior description on speculation, for the purpose of being let or sold over again at an advanced rate. The prices paid for such properties in closes and back-courts range from six to eight years' purchase. In most cases such properties have been purchased by persons who seek to derive as large a return as possible without much view to sanitary arrangements—a few laudable cases form the exception. It thus appears that investment companies have not altogether realised the object originally contemplated—namely, of enabling working-men to become proprietors of their own dwelling-houses; nor have they in any sensible degree been the means of improving the houses of the working-classes. A co-operative building company has lately been formed, with a nominal capital of £10,000, in shares of £1 each. I believe there are already upwards of 200 members. Such a company, if once firmly established on a broad basis, might do much to meet the demand for workmen's houses; but to be available to any considerable extent, they would require a large capital for investment. Such a company, for some time at least, cannot be expected to have capital ready to invest in fixed property. Their object at first must be to build and sell rather than to hold heritable property for the purpose of being let to workmen. Associations of the nature I have formerly referred to, as exemplified in that of 1826, might work harmoniously along with the co-operative building society—the one advancing the money to build, the other entering into contract. Benefit societies, where capital has been accumulated, might also lend their money in aid of the erection of workmen's houses, where a secure investment is offered. There are many ways in which workmen may combine to secure this desirable object. The first great desideratum, however, is to secure the erection of additional houses by any means; by all means get houses, they are required, they must be provided. The next step is to look into the existing house accommodation occupied by the lower-rented tenants, paying from 1s. to 1s. 9d. per week for rooms such as I have already described. So long as these hovels are allowed to remain they will be filled by tenants of one sort or another. In the energetic language of a distinguished citizen, "So long as you have places only fit for pigs, you will get pigs to occupy them." Self-preservation calls on us to remedy this growing evil. How is this to be done? that's the question. Let those old houses of "excessive, incommodious, and dangerous" height be deprived of two or even three of the upper stories. Open up new lines of streets midway between the High-street and the Cowgate on the one hand, and the Old Physic-gardens and north back of Canongate on the other, parallel to the High-street, or winding in such directions as the special necessities of the case may require, and having large openings into the leading streets wherever practicable. Or let closes be opened up by throwing down each alternate row of old houses. What is wanted is free open space.

"GIVE AND TAKE" COMMISSIONS.

SO many of our readers, both professional and unprofessional, have addressed us with reference to a recent lawsuit that we feel no longer at liberty to maintain the reserve we had hitherto observed. Our silence has been variously interpreted, in some cases rather unfairly; for we neither felt inclined to shirk duties incumbent on us, still less to volunteer a defence of professional practice without regard to the merits of the suit in question or to the interests of the public involved in it. It is quite true that an organ of the profession owes a duty to it, but a duty more imperative and important is due to the public. Nor is the duty a divided one, for the interests of the public and of the profession are identical. They cannot be separated without injury to both, and the one cannot be slighted without detriment to the other. It is all the more necessary and apropos to insist upon this point just now, when the profession is engaged in the arduous task of self-reform and purification—when it is occupied with the preparation of a system of professional education, to give the public the best possible guarantee that architects shall be thoroughly instructed in the theory and practice of their art for the efficient discharge of their duties, and when an ungenerous advantage is sought to be taken in certain quarters of the confusion which naturally accompanies reform to exclude regularly educated architects from employment on architectural works.

The report in a recent number of the BUILDING NEWS of proceedings at a meeting of the Society of Arts will show how justifiable were the warnings we have given the profession for some years past. When professional enthusiasts have ridiculed the well-meant interest displayed by amateurs, have insisted that non-professional persons were incapable of appreciating the merits of architectural design, and have protested against the interference of clients and the public, we warned them that they were using a two-edged weapon that might be turned against themselves at any time. No longer ago than the 15th of November we wrote that it would be "impolitic to augment the irritation of the public against the profession, for there already existed a tendency or predisposition to avoid employing architects in several quarters, but more especially in Government regions;" and further on, that if architects sought to exclude the public on the grounds of being incapable of knowing anything about architecture, the public might turn round and say, "If we are not to be allowed to select what pleases us, we will not spend our money upon what we cannot understand, and are not to be allowed a voice in. Rather than be controlled by an architect, we will dispense with his services, save his commission, and construct ourselves substantial edifices, having no pretensions may be to design, but built for less money, and to suit us."

Again, on the 6th of December, we repeated the warning that "there is a marked and growing tendency on the part of persons who spend money in building operations to avoid employing architects." Well founded as we knew these statements to be, and urgently called for as we felt the warnings to be which we have so repeatedly given, we readily admit that we did not anticipate so early and complete a confirmation as they have met. When Mr. Cole told the amazed listeners at the Society of Arts that, "Profiting by their experience of the most eminent architects and engineers the Commissioners determined on this occasion (constructing the International Exhibition Building) to have nothing to do with them," he admitted everything we had previously stated, and he gave so clear an intimation of the intentions of the chief employers of architects, that the profession would do well to take heed in time, and set its house in order before they are involved in the coming struggle. How far this deplorable repulsion to the employment of architects is due to architects themselves we do not purpose to inquire now. The absurd pretensions to exclude the public on the grounds that no one but architects can understand architecture have doubtless largely contributed to this irrational and unjust prejudice. We do not attempt to conceal or excuse the *laches* of the profession, it would be great unkindness and gross neglect of duty to do so. The profession, from culpable indifference or some less creditable cause, has suffered the most lucrative branches of practice to pass away from it entirely. Architects do not build our bridges, or viaducts, or railway stations, or docks, or dock warehouses, or lighthouses, not to mention numerous other works of construction, all of which have been allowed to lapse to the domain of civil engineers. Churches, street structures, park lodges, and almshouses, are for the present left to architects. But such architectural monuments as bridges they have abandoned, and if the same policy be persisted in, we may expect to see shortly architects the only professional men acquainted with the practice of construction that will be excluded from the practice of architecture.

The case to which attention has been directed is illustrative of the inclination which public feeling is taking, and of the evils which beset the profession. An architectural firm at Whitehall—Messrs. Nelson and Innes—were requested, in conjunction with other architects, to send in designs for a school-house and premises proposed to be erected at Hilston. They did so, and added estimates by which it appeared that their design could be carried out for £1,543. The Committee for managing the school approved Messrs. Nelson and Innes' design, but suggested alterations, which were made. Tenders were next called for the execution of the works, and the lowest sent in was upwards of £2,000, being considerably beyond the estimates, and beyond the means at the disposal of the Committee. The consequence was the project was abandoned, and the architects brought an action against the Committee to recover 5 per cent. commission on the cost, on the grounds that they had prepared the plans and drawings upon the understanding that they were to be employed to superintend the erection of the structure. The Committee denied their liability, on the plea that the architects had induced the belief that the plan, as altered,

could be carried out for the original estimate, which the tenders sent in proved could not be, and, in fact, that the estimates would be exceeded by several hundreds of pounds. The architects replied that the alterations were so substantial, and, in addition, that the Committee must have known, even if they had not been informed, that their cost would increase the estimate. This the Committee denied, and asserted that the architects had informed them that the alterations would amount to a "give and take," and could be executed for the sum stated in the original estimate. Upon this point conflicting evidence was adduced; the trial lasted two days, after which the jury had to be discharged from being unable to agree in a verdict—a most unsatisfactory conclusion, perhaps, more mischievous than a verdict for the Committee.

Looking calmly and impartially at the general features of the case, it is impossible not to see that there have been faults on both sides, or that committee and architects have been victims of the vicious system by which architectural commissions are canvassed for and awarded. First, we have the substantial and glaring injustice that architects have been employed, without remuneration, to prepare designs and estimates; that they have spent their time and money in doing so, and in dancing attendance upon committees, embodying suggestions for alterations where practicable, and reasoning them out of absurdities. Nothing that can be said; no pleas *ad misericordiam* about the work being a charitable one, can get over this scandalous injustice. "The laborer is worthy of his hire," the chief member of the committee occasionally tells his congregation we presume. If he believes in the text, from which he may, perhaps, have preached, surely he ought to have put it into practice. There is no question that the architects did do a certain amount of work, for which they are entitled to be paid. But the system of public competitions, the professional touting for commissions, have compelled architects struggling for practice to work for nothing, and to charge for plans, estimates, and designs on the commission for superintendence. Here is the root of the evil. We know no other profession or trade in which men tout for employment, and give their services gratuitously, or at best at so unsystematic a scale of charges. So long as the system is allowed to remain so long will a large amount of professional labor remain unremunerated, and the more will ill-feeling be manifested between the public and the profession.

One of the evils of this system is that it puts the architects, who had the right to remuneration on their side, into a false position, and charges to them several errors. As architects and professional advisers to the Committee, they should have given distinct information as to the amount by which the original estimates would be increased to carry out the alterations suggested. It was not for them to assume that the Committee must know there would be an increase. It was the architects' business to cause it to be known.

Into the conflicting evidence we shall not go, although some light might, perhaps, be shed on it if it were stated whether the architects claimed commission on the original or on the increased estimates. In the first case, they would have put themselves out of court and confirmed the case of the Committee; in the second there would be a presumption in their favor. It is sufficient that payment was refused for labor admitted to have been done, and that a jury exhibited an inclination to deny to architectural laborers the hire which they withhold from no other professional men or, indeed, artisans.

THE ROYAL HOSPITAL FOR INCURABLES

THE Hospital Committee has recently purchased some 20 acres of freehold ground at Coulsden, on the same Surrey hill which bears the Asylum for Fatherless Children. They propose to build there a fitting hospital for their patients, and in order to obtain a good design, they invited a short time since eight architects to a limited competition. The several designs six in number, (two architects having failed to comply with the invitation), have been for two days last week on view at the offices in the Poultry. After a careful inspection of them, we cannot but approve in every way of the Committee's selection. The losing men are fairly beaten; and the Committee have shown an amount of taste and judgment in their choice rarely evinced in competition cases.

All the designs, barring one, which is really a melancholy instance of misdirected industry, by apparently an ambitious clerk of works—show more than average ability. Either of the five designs would have been worthy of execution, and with such drawings and such rivals it is an honor even to be a non-successful man. The leading idea in all the plans is the disposal of the male and female patients in opposite wings of the building, with the board-rooms, offices, and principal entrance in the centre. The manner in which this idea is worked out constitutes their relative superiority. Mr. E. M. Barry's plan "Blessed are the Merciful," meets the difficulty of the sloping ground and overcomes it skilfully. The centre is thrown back, and an extra floor is obtained to the wings on the lower portion of the ground. In the middle of the wing-blocks covered recreation grounds are provided, with arcades which form the corridors to the rooms, grouped round them. On one side of each of these covered courts there is an inclined way to the several floors, by means of which the patients may be easily moved up or down. In the centre of the entire block, the entrance-hall, kitchen, offices, servants' hall, and other offices are placed. Over them, on the first-floor, is the board-room, secretary's-room, &c. The sitting-rooms of the patients are in the most promising portions of the wings. On the basement, which is entirely above the ground, there are store-rooms, cellars, and a set of apartments designed for Turkish baths. The convalescent-room is over the board-room on the upper floor, and the servant's bed-rooms are in the attics by the side of it.

The front basement wall supports a continuous terrace, which is a very fine feature in the elevation. Each wing has minor wings with semi-octagonal turrets, between which the terrace runs. In the front of the terraces there are semicircular headed windows to light the basement. Coupled semicircular headed windows, enclosed by a similar arch, but with pointed archivolts, light the principal floor. The same arrangement, omitting the outer arch, is repeated on the floor immediately above it. The roof is high-pitched with gabled attics in it. The central feature over principal entrance is a massive square tower with chimney-stacks forming pinnacles at the angles. The whole is a well-studied and very artistic composition, beautifully proportioned, and showing a thorough mastery of the style adopted. The design of the covered courts is equally effective. Single arches form the corridor on the lower floor; they are subdivided into two pointed arches, with a colored shaft and balustrade between them, on the floor above. The roof of the courts is entirely of glass. The design is very compactly planned and we should regret, if pecuniary circumstances prevented its being carried out in its entirety.

The design of "A. B. C.," by Mr. Coe, to which the second premium was awarded, is only inferior to that which we have just briefly described. It consists of three parallel lines of building, connected by lines of building in front and rear, and by a corridor in the centre, thus forming two enclosed gardens and two courts. It is an Italian design with a high tower in the centre. The uneven ground is made up to a level, and shows consequently external terraces, but this way of getting over the difficulty strikes us as being more expensive and less capable of picturesque arrangement than that adopted by Mr. Barry.

"Consolation" is on plan of the form of the letter **H**, with the entrance in the centre. The high towers and spire roofs are artistically grouped, and it is well drawn, although sadly out of perspective.

The design marked "In good Faith," is the only pure English Gothic design out of the six submitted. Like that of "A. B. C.," it is designed for level ground. There are three lines of building running from front to back, connected in front, and by a recreation corridor in the rear. The larger apartments project from the main line of the several façades, and are faced with gables, which vary the outline, but somewhat destroy the breadth of the design. All the roofs are high pitched, and the windows pointed. A central tower has a saddle-shaped roof on it, with a pinnacle in the centre of the ridge. The design is a very quiet unassuming one; it gives all the required accommodation, and would moreover prove perhaps the cheapest of all in execution.

We hope the author of the drawings marked with a circle will appreciate our kindness in simply acknowledging the labor he has bestowed upon a design which is really not worth a tithe of the application given to it. There is likewise a vast waste of time visible in the design placed by itself, without motto or device, in the lower room. It is not that the design is defective; on the contrary, it is full of merit, but we cannot see the advisability of attempting to overawe the Committee by the magnitude of the perspective view. Here we have a drawing, capably executed, we admit, some 12 or 15 feet long, and proportionately high, and yet the first prize is gained by Mr. Barry without a perspective view of any kind. A smaller view would have shown all its points without making so large a demand upon the limited space for exhibition. If in an unlimited competition architects were to work on this extensive scale, there would be an end of the public exhibition of the designs, because Committees could not find sufficient wall space for them. The design is one, nevertheless, of great merit. It is Italian in style, and is grouped very picturesquely together. One wing of the main building is thrust forward, and the other backwards, so as to conquer the difficulty of the sloping ground, and, at the same time, to obtain thoroughfare ventilation. The principal apartments project from the main lines of the front, and the spaces between them are occupied by colonnades. This allows a cheerful play of light and shade upon the building. The Board-room, secretary's offices, &c., are put together, forming a kind of outwork to the building with which they are connected by an underground gallery.

Mr. Barry's design will, we hear, be carried out, and we shall be glad to have this rumour confirmed, because we feel that the noble charity will therein be fitly housed.

THE SANITARY CONDITION OF WINDSOR.

THE Mayor of Windsor, Wm. B. Holderness, Esq., has directed Mr. C. S. Voules, Clerk of the Local Board of Health, to publish the following:—

The attention of the local authorities has been called to the reports in the *Times* and other papers with reference to the present sanitary state of the drainage of Windsor. I am directed by the Mayor, in his official capacity of Chairman to the Local Board of Health, as well as from his own personal knowledge as one of the medical practitioners in this town, to assure the public there is no foundation for the reports in question, and that there is no fever whatever in this district, and that during the last three years we have been peculiarly free from that epidemic. And with reference to the drainage of the district (which was constructed under the direction of the most eminent engineer in such works), it is in a most efficient state; and that on the last survey of the late Mr. Austin, one of the superintending inspectors of the General Board of Health, about two years since—when he devoted two days to a minute inspection of the district, he expressed his entire satisfaction at the system of drainage; and stated that with a few additional flushing-tanks to some of the branch drains, the works would be most perfect. These flushing-tanks were immediately constructed, and are now constantly used; and I may add, that the main sewer is also constantly flushed by the flowing of a large body of water from a feeder from the Thames, which enters the sewer above the town and passes through, and thoroughly purges it at a considerable distance below the town. And with reference to fever, I have ascertained that, from the beginning of December last year, up to the present time, there has been but one death from that source—exclusive of the one the country so deeply laments—and that, with a population of about 10,000, the deaths have not been twenty in a thousand.

The Mayor has deemed it right to authorise this statement to prevent the spread of unnecessary alarm with reference to the condition of the town.

CHARLES STUART VOULES, Clerk to the Local Board of Health.

The *Medical Times*, in a lengthened article on the drainage of Windsor and the Castle, states that on a recent inspection by a competent member of the profession with the clerk of the works at Windsor Castle and the registrar of deaths and other officials, they came to a conclusion that "of the Castle sewerage we know no place where a more complete or more carefully-worked system of drainage is to be found, nor one which, considering the difficulties of the position, is more thoroughly successful. Gases undoubtedly do escape when the sewers are opened, but in such very small quantity as to prove both the extreme cleanliness of the sewers themselves and the absence of any ascending current of importance in them.

RESIGNATION OF THE DISTRICT SURVEYOR OF ST. JAMES'S.

AT the last meeting of the Metropolitan Board of Works a letter was read from Mr. Charles Mayhew, resigning his situation of District Surveyor of St. James's, Westminster. The letter was as follows:—

Office of the Surveyor of the District of St. James's, Westminster, 14, Argyll-street.

To the Members of the Metropolitan Board of Works.

GENTLEMEN.—Since writing my letter of the 2nd December to your honorable Board, requesting your sanction to the appointment of my brother, Mr. George William Mayhew, to perform the duties of my office as surveyor of the district until the end of this month, I have read in a public journal a report of the late proceedings of the Committee of your honorable Board appointed to consider matters relating to the Building Act, from which it appears that the whole of the duties of a district surveyor are to be performed personally, or by a deputy who has received the sanction of your honorable Board. I, therefore, consider it my duty to state that I am not prepared in future to perform the whole of the duties, and as I should—after having held the appointment for so many years without reproach, and having, I hope and believe, discharged the duties, with such casual assistance as I required, to the general satisfaction of the parishioners—be exceedingly annoyed to be personally rebuked for doing anything contrary to the regulations of your honorable Board, I feel the time has arrived that I either ought to apply for permanent assistance or to tender my resignation. After mature consideration, I have adopted the latter course, and beg to inform your honorable Board that from and after the expiration of this month I hereby resign my office, and do so with feelings of no ordinary regret, as I and my father were born in the parish; my father was for many years its district surveyor, and when he died, at the age of 75, I was unanimously elected by the magistrates of Westminster to succeed him (all opposition having been withdrawn before the election took place), and, therefore, it may be easily imagined that it requires no little fortitude on my part to cut the last tie of connexion with the parish in which, for three generations, the name I bear has been so well known, and, I am truly happy and grateful to say, so kindly supported. I hope that your honorable Board will excuse me for making these unnecessary remarks, but I could not refrain from doing so; and also for soliciting that my brother may be temporarily appointed to discharge the duties until my successor be installed. He intends to ask your permission to be a candidate for the office, and if your honorable Board think him qualified on his merits (which I believe him to be) to succeed me, it will afford me great gratification to know that the name will still be connected with the district. I have now only to thank your honorable Board for the courtesies which I have always received from it and its officers during the time I have had connexion therewith, and to remain, gentlemen, your most obedient servant and officer,

(Signed) CHARLES MAYHEW.

The resignation was accepted, and Mr. Kendall, surveyor of an adjoining district, was appointed to act in the room of Mr. Mayhew until his successor is appointed.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE following Address of Condolence of the Royal Institute of British Architects has been forwarded to the Right Hon. Sir George Grey, Bart., her Majesty's Principal Secretary of State for the Home Department, for presentation to her Majesty on the decease of his Royal Highness, the Prince Consort:—

The Dutiful Address of the Council of the Royal Institute of British Architects to her Most Gracious Majesty the Queen.

May it please your Majesty,

The President and Council of the Royal Institute of British Architects, on behalf of themselves and of the other members of their body, desire respectfully to approach your Majesty with the expression of their deep-felt sorrow and sympathy on the recent death of H.R.H. the Prince Consort, an irreparable loss to your Majesty, to the Royal Family, and to the whole of the British Empire.

The noble and amiable character of the Prince, as a husband and a father, had won the respect and gratitude of your Majesty's loving subjects. His high intellectual attainments and promotion of the Fine Arts, his patronage of science, and his enlightened support of every useful and benevolent work will render his memory enduring, as one of the great benefactors of the nation, and this Institute cannot but lament, in their late patron, a Prince whose loss they feel it impossible to supply.

This Council earnestly pray that your Majesty and the Royal Family may derive every support under this heavy dispensation of the Almighty, from the consolations of our holy religion, and from the contemplation of the virtues of a Prince so eminently estimable in all the various relations of public and private life.

Signed by,

WILLIAM TITE, President.	BENJ. FERREY.
THOS. L. DONALDSON, V.P.	JOHN B. WARRING.
M. DRAKE WYATT, V.P.	GEORGE EDMUND STREET.
GEORGE GILBERT SCOTT, V.P.	JOHN NORTON.
JAMES FERGUSON.	WILLIAM HAYWOOD.
CHAS. C. NELSON.	ROBERT KERR.
EDWARD M. BARRY.	T. HAYTER LEWIS, Hon Sec.
WILLIAM SLATER.	F. C. PENROSE, Hon. Sec. Foreign

[Correspondence.]

THE next Ordinary General meeting of the session will be held on Monday next, when a paper will be read by Mr. G. G. Scott, "On the Conservation of Ancient Architectural Monuments and Remains."

A Special General meeting of members only will be held on Monday, the 13th inst., to receive a report from the Council on "Professional Practice and Charges."

THE ARCHITECTURAL MUSEUM.

THE prizes for Colored Decoration, offered through the Architectural Museum by the Ecclesiological Society, have been awarded.

On opening the envelopes bearing the private marks attached to the specimens selected, the successful competitors were found to be—For the 1st prize of £5 5s., Mr. Joseph Peplow Wood, of 25, Brown-street, Bryanston-square; for the 2nd prize of £4 4s., Mr. A. O. P. Hamson, of 337, Euston-road; and for the 3rd prize of £2 2s., Mr. Charles J. Lea, of High-street, Lutterworth.

The twenty-two specimens sent in are now exhibited in the Museum.

The result of the remaining competitions will be made known when the adjudication has taken place.

CHURCH AND CHAPEL BUILDING.

Stratton Audley, Oxfordshire.—The parish church of this village has just undergone repairs and partial restoration at a cost of about £800. The works were commenced by taking down and rebuilding the chancel arch, which was in a most insecure condition, and by thoroughly restoring the woodwork of the roofs over the north aisle, which was much decayed, and renewing the leadwork. It was determined, during the progress of these works, to restore in a similar manner the coverings of the nave and south aisles, and this has also been done. The chancel, nave, and south aisle have been re-seated, a new altar rail has been provided, and the timbers of the chancel roof restored. The stonework of the windows has been repaired throughout, and several lights, or parts of lights, which had been blocked up, have been re-opened, and the whole newly glazed; internal drop arches in stone have also been substituted for wooden beams over the aisle windows. Several lesser improvements or restorations have also been effected in the interior. Want of funds has caused the intention of completing the restorations by a thorough repair of the external masonry of the church to be postponed. This church is an interesting and rather peculiar one. It contains a good deal of work of the Decorated period, and shows here and there traces of an earlier buildings, but was altered, not for the better, in the Perpendicular period. A fine north porch of late work forms the most remarkable feature of the exterior. During the works, several fragments of ornamental encaustic tile paving of good design were discovered. The works have been carried out by Mr. Selby, builder, of Oxford, and the carving done by Mr. Jacquet, under the superintendence of Mr. Roger Smith, architect.

Bury St. Edmund's.—St. James's Church.—We understand that another effort is being made for the restoration of the roof over the nave of this fine edifice. It is to be hoped that the effort may be attended with success; for the unsatisfactory state of the old ornamental ceiling, and of the present unsightly scaffolding, is a reproach to the town.

Oxford.—Isle Church.—This edifice has recently been re-opened for public service. The edifice, which was in a very dilapidated condition, has been restored throughout, from the designs and under the superintendence of Mr. E. Bruton, architect, even to the underpinning of the northern arcade, which was found to be in a very dangerous state. This arcade is the earliest part of the church, and was erected, probably, about the end of the twelfth century. The columns, with their caps and bases, were repaired where necessary, and a new arch inserted at the east end of the arcade. The church, which is generally of the fourteenth century, consists of a nave, aisles, and chancel, with tower, in the Perpendicular style, at the west end. The walls generally have been repaired, the bases of the chancel arch restored, and the windows of the south aisle have had their mutilated tracery restored. The tower arch and western window have been thrown open to the church by the removal of the old gallery. The passages have been paved with a pattern composed of Mansfield stone in three colors. A new porch has been built upon the site of the old one, new oak doors placed to each of the entrances, and new benches in nave and aisle, new reading-desk and pulpit have been provided, all in oak. The roofs have been repaired, several of them new slated, the old garret windows removed, and the timbers brought to an even color. The windows of the south aisle have been filled with Powell's quarries. The chancel was built in 1680, in the style prevalent at the period; but the upper six feet of the walls have been removed, and the windows replaced with new ones having geometrical tracery. A high pitched open timber roof has been substituted for the depressed roof of Dr. South's time. The chancel has also been new seated, and the floor paved with marble squares and encaustic and plain tiles in various colors. Mr. Wyatt, of Oxford, was the builder, and the whole of the alterations have been effected at a cost of about £1,800.

York.—Arncliffe Church.—This church, which had been closed for alterations, &c., was re-opened on Christmas Day. Amongst the improvements, open benches have been substituted for the old-fashioned high pews, which choked up the area of the chancel. The aged poor are now accommodated round the pulpit, in place of being seated, as formerly, in a remote corner of the church. The new church furniture comprises a lectern, carved in oak by Mr. Matthews, of Leeds, and an octagon pulpit in Caen stone, with marble pillars, and panels with medallions containing figures of Christ and the Evangelists in relief, carved by Messrs. Mawer and Ingle. The designs were furnished by Mr. Arncliffe, architect, under whose direction the restoration has been carried out.

Osgathorpe Church, Leicester.—On the 17th ult. this church was re-opened. It was originally built during the thirteenth century. In restoring it care has been taken to preserve its original character. It has been enlarged by an apsidal termination at the east end, in order to gain additional seats; in doing which the arch of the east window has been made use of to form the entrance to the apse, the mouldings being brought down to the ground. A new roof has been put on, the principal timbers being supported by stone corbels. The benches are of pitch pine varnished. The floors to the aisle, apse, &c., are laid with Whetstone's Coalville tessellated tiles in pattern. The pulpit is of stone, moulded. The reading-desk, of pitch pine, has a panel front to support the book-desk. The octagonal font has been restored. A stone porch has been erected, and a bell-turret in wood, with spire covered with lead, has been placed at the west end. The works have been carried out from designs and under the superintendence of Mr. J. Mitchell, of Parliament-street; the contractor was Mr. Garland, of Nottingham.

St. Michael's Church, Bromley.—On Saturday last the Right Rev. the Lord Bishop of London opened the first instalment of this edifice. The portion is the boy's school; when the funds will permit, a girl's and infant schools will be built, and also a suitable church. The school-room now opened will seat 650, and afford accommodation for the instruction of 250 or 300 boys, with suitable class-rooms adjoining. The site cost £900, and the buildings now erected have cost about £1,700. £6,000 more will be required to complete the church and schools, and residences for the master and mistress. The architects are Messrs. Morris and Sons, of London-street, City. The contractor is Mr. Brown, of Ratcliff. The school-room now opened is 78 feet by 33 feet, in the pointed Gothic style, with an open timbered roof of stained deal. In addition to the class-rooms, there are lavatories and other conveniences. The building is constructed of brick, lined internally with white brick, and the arches are decorated with colored bricks. Over the altar there is a motto, and another over the principal entrance. Two sunlights are to serve the purposes of ventilation and of lighting. The ventilation is also assisted by movable louvres in the roof. The recesses on one side of the building are filled up with the Beatitudes from the Sermon on the Mount, painted in colors on zinc. Externally, the building shows colored bricks in the arches and string courses.

Worcester.—New Aisle in St. John's Church.—The ceremony of consecrating this addition took place a few days ago. A local authority says, respecting the work:—"When viewed from the Bromyard-road, the character of the church, on the north, is seen to have been completely altered, and a change effected which must be gratifying to those who have subscribed their money for the alterations, as well as to every admirer of the Pointed style of ecclesiastical architecture. The spectator has now before him a building in the Early Decorated style, with walls of Ombersley stone, with Bath stone windows and dressings, and a roof covered with tiles ornamentally arranged. There are four two-light windows on the side. Unfortunately the accommodation required in the church has rendered a gallery necessary, and in consequence of this, stone transoms have been carried across the windows, and this rather tends to make them look heavy. The east end has a window of similar shape to those in the side. A large rose window, also filled with tracery, has been introduced into the angle of each of the gables. The wall is strengthened with buttresses. The gables are ornamented with foliated crosses. The roof is covered with tiles laid in bands of red and black, the red bands being also crossed diagonally with black tiles. The new aisle is 57 feet in length, and 22 feet in width; the old aisle was 17 feet 6 inches shorter, and only 11 feet wide. The increased sitting room obtained by the alterations will accommodate 253 persons. Mr. Perkins is the architect, and Messrs. Hemming and Son the contractors.

CHAPELS.

Durham.—New Methodist Chapel.—The New Connexion Methodists have erected a chapel, in the Early Pointed style. Stone has been used throughout the building. The entrance is by a porch with trefoil-arch opening, splayed jambs, moulded labels, &c. The gable end fronting the street is pierced with pointed arch windows, the openings having splayed jambs. The interior fittings are of Petersburg pine, wrought, stained, and varnished. A platform is provided in a recess of the rear gable for public meetings, as well as for the usual Sabbath service. Adjoining the chapel is a vestry with an entrance from the porch. Mr. G. Kyle, architect, designed the building, which was erected by Mr. James Smith.

Bristol.—Chapel on the Batch, St. Philip's.—The new chapel now being completed at this place was erected by Mr. Yalland, the contractor, in the short space of three months. It is built in connexion with the body of Christians called the Brethren. It is estimated to accommodate 1,000 people, and the cost will be between £2,000 and £3,000.

THE THAMES EMBANKMENT.

A Bill for the Thames embankment has been printed and circulated, and the plans and sections are deposited with the clerk of the peace and other authorities under the standing orders. From these documents we learn the general character and extent of what is now proposed, and which are as follows:—The embankment starts from the lower side of the New Westminster-bridge, ranging with the face of the abutment of the new bridge, and continues in a curved line, following what is generally called Page's line, to the back of the first abutment of Waterloo-bridge. It then starts again from the lower side of Waterloo-bridge at the corresponding point, and proceeds in a similar curved line until it terminates abruptly against Blackfriars-bridge, 2½ chains nearly, or about 100 feet, into the river beyond the present wharfs and houses. The embankment is solid throughout, and the projection into the river, in some cases very considerable, is to be filled in by soil taken from the Thames, or otherwise obtained. The height of this new wall from Westminster-bridge to the east side of the Temple is to be 4½ feet above Trinity high-water mark. From that point the embankment ascends rapidly by a steep viaduct to the level of Blackfriars-bridge. This viaduct, we presume, would stand on the level of the embankment, and would be 40 feet above low-water mark. On the surface of the land thus gained there is first to be a public road 190 feet wide from Westminster-bridge to the Temple, where it is to become 70 feet wide only. In addition to this road or street, property is also scheduled for the following new streets, viz., first, an entirely new street from the Banqueting-house at Whitehall down to the river; secondly, Whitehall-place is to be continued down to the river, and will form part of an entirely new street between the Strand and the river, terminating at Waterloo-bridge, just opposite the new wing of Somerset House; thirdly, Norfolk-street, Surrey-street, and Arundel-street, are to be made to join the river by a common communication to the new road; and lastly, from Blackfriars-bridge a new street is shown from the bridge to the Mansion House, joining also New Cannon-street. This street proceeds first obliquely, and then nearly parallel to the river, avoiding the Times office, the Equitable office, and Apothecaries' Hall, where it goes off at an obtuse angle, and is continued across New Cannon-street, to the front of the Exchange and Mansion House. The Bill constitutes a board for carrying these enormous works into effect, consisting of the chairman and four members of the Metropolitan Board, and two members of that Board returned by the Corporation of London, thus forming a board of seven members in all; it empowers the borrowing of one million and a half of money, and gives compulsory powers of purchase, sale, &c., in the usual way. It enables the Board to deal with the Chatham and Dover Railway and Bridge, but the Hungerford, Blackfriars, Westminster, or Waterloo bridges are not to be interfered with, and the levels appear very embarrassing. Houses may be built on any of the vacant lands, subject to the approbation of the Board of Works, but none are to be built in front of the Temple.

The Low-level Sewer is but slightly referred to, the only clause relating to it being one empowering and directing the Board to facilitate its construction.

The Commissioners appointed to inquire as to the propriety of embanking the south side of the Thames met again yesterday, the Lord Mayor presiding.

Mr. Crosby said he was engaged by the Metropolitan Board of Works, and he had the superintendence of portion of the main drainage works on the south side of the river. He found that in the district of Rotherhithe and Bermondsey the houses were from time to time flooded. He also found that when trenches were dug make sewers, the water in them rose and fell with the tide. If he had unlimited authority he would carry out an embankment along the whole side of the river, whether on the present line or not must depend on the conveniences of trade, which must be pre-eminently considered. At Lambeth an embankment, such as Mr. Cubitt made at Pimlico, he should recommend—at Rotherhithe a perfect

wall only. As to Fore-street, he should suggest either that much land should there be reclaimed, and the road widened, or else it should be widened by pulling down present buildings. He could conceive that puddling might improve the state of things, but he did not see how it could possibly be carried out. The main drainage will do much to improve matters, but not entirely arrest them. It will at once drain the water from the cells. On the question of taxation he should suggest tonnage dues on all articles coming into the port of London, thus taxing the whole country. It would not answer equally to pay the cost out of the Consolidated Fund, as by the plan he proposed the trades benefited by the embankment would pay. He did not think that the octroi system, though it succeeds well in France, would answer here. He agreed with the Lord Mayor, and would not impose it here if he could. He then produced the plans and sections of the banks of the river and the low-lying districts.

Mr. Pegg, of Bankside, who had premises abutting on the river, explained that floods took place in the manner already described, and he recommended an embankment and a roadway. He was one of a commission some years ago appointed to raise Bankside. They did not raise it so much as they intended owing to the opposition of the wharfingers. He described the misery occasioned to the poor of the district as most shocking. The cost of construction was so great as to cause much opposition. Although not carried so high as was intended, it had done great good.

After some further evidence, the inquiry was again adjourned.

ALLEGED FRAUD BY A CLERK OF WORKS.

WILLIAM BRITTAIN, clerk of the works at the new building in course of erection in Bennett's-court, Drury-lane, by the Central London Dwellings Improvement Company, having been charged at Bow-street by Mr. Brown, the architect, with obtaining money under false pretences—

The prosecutor, Mr. Thomas Henry Johnson Brown, of Robert-street, Adelphi, deposed: I am an architect and surveyor, and I engaged the prisoner as clerk of the works in the buildings now being erected under my superintendence in Bennett's-court. His salary was £2 2s. a week. It was his duty to engage the men employed there, and to account to me for the work done each day, and the amount of wages. He had to make up a weekly report, called the pay-sheet, containing the names of the men. I now produce one of these returns, that for November 1st. In that return a man named Curley is charged as a laborer at 4s. 6d. per day, and the amount due to him as £1 0s. 2d. I discovered that this man has never received 4s. 6d. per day, but has been paid 3s. 4d. In all the bills he is charged at 4s. 6d., and he has been really receiving but 3s. 4d. all the time. In this bill there is also a charge of £1 1s. for another laborer named Davis, at 3s. 6d. per day. I find he only received £1 a week. A man named Murphy, also charged at 3s. 6d. a day, has only received £1 a week. Indeed, I believe that the same rule applies all through. Believing the amounts charged to be correct, I have from time to time supplied the prisoner with the money to pay them. The accounts are made up to each Friday. Upon my attention being drawn to the matter, I accused the prisoner of charging me more than he paid the men, and he said that the account was correct, and that he had in every case paid what was entered, and had made the men sign the book on receiving their money. I looked to the book, and found that it was signed as he stated, but the amounts had not been carried out, so that what they signed was simply the number of days and hours, without even the rate per day.

The prisoner alleged that the amount was always carried out in pencil before the men signed. They wrote their names over the pencil marks, which, therefore, were partly obliterated, but if examined with a microscope, they would be found to have been written before the signatures.

Several witnesses were examined in support of the charge, and the prisoner was committed for trial.

THE MASONS' STRIKE.

THE various lodges composing the London branch of the Operative Masons' Society have, under the sanction of their executive council, decided upon continuing the strike against the hour system (which has lasted now for eight months) during the ensuing winter months and until the commencement of the building season in the spring. It is said they have taken this step after due deliberation, and well considering their own position, as well as that of those employers who have adopted the hour system. The men state that they have a large proportion of their number at work under the terms of the compromise, and that the smaller number are weekly giving in their adhesion to those terms, and that while the society has had but few secessions from its ranks, a greater number of non-society men who had previously stood aloof have joined it. The number of employers who adopt the system of payment and engagement by the hour has not increased one since June last; that, while the London yards and jobs of these employers are, with one or two exceptions, but inefficiently manned, their country jobs are, and have been for some months, almost at a standstill. They therefore consider the balance to be in their favor. The Masons' Society have hitherto allowed each member on strike 10s. per week from the general fund, at an expense of several thousand pounds; but to prevent this fund being reduced beyond prudent limits, and at the same time to meet the expenses consequent on the prolongation of the dispute, a proposition is now before the lodges of the society for a weekly levy of 6d. per man on each of their 12,000 members, which, it is expected, will come into immediate operation. A fresh impetus has also been given to the general trades' subscriptions; among others, the general union of carpenters at Nottingham have voted a levy of 6d. per man, which has produced nearly £100. A public demonstration of the London trades is shortly to be held upon the subject. The number of masons now on the strike-books is about 300.

ARCHITECTURAL ASSOCIATION.

THIS (Friday) evening there will be a meeting of this body, when the adjourned discussion on Mr. Blashill's paper, "A few days at Chartres and other French Towns," will be resumed.

ELECTION OF DISTRICT SURVEYOR FOR CHELSEA.—This day (Friday), the Metropolitan Board of Works will proceed to the election of a gentleman to fill the vacant office of surveyor for the district of Chelsea.

DECISIONS IN THE COURTS.

CASE UNDER THE BUILDING ACT.

Timber Structure.—At the Greenwich Police Court on the 14th ult., Mr. Samuel Cooper was summoned by Mr. William Snooke, District Surveyor of St. Mary, Rotherhithe, for erecting a building comprised wholly of wood and timber, contrary to the provisions of the Metropolitan Buildings Act.

A second information was also laid against the same defendant for erecting the said building without giving two days' notice thereof to the surveyor.

Mr. Snooke stated that he discovered the building in question, erected in September last, upon premises in the occupation of the defendant, who is a stonemason, carrying on business at Clarence-wharf, Rotherhithe; that the said building was wholly of wood, 15 feet long, 8 feet wide, and 9 feet in height, with windows and door, and used as a counting-house; that it was mounted on a wooden cill, and access was had to it by means of a ladder; that there was no fire-place, but it was possible to have gas burnt in it; that it was not attached to any other building, but was within 6 or 8 inches of the wharf belonging to the Surrey Gas Consumers' Works. Mr. Snooke stated that the building had been constructed without notice being given to him in the first instance, and that, on discovering the same, he had, on the 28th October, caused a Notice of Irregularity to be served on the defendant requiring him to amend the same within forty-eight hours; that the defendant had neglected to comply with that notice, but had subsequently applied to the Metropolitan Board of Works for their permission to allow the building to remain, which permission had, however, been refused.

It was contended on behalf of the defendant by his solicitor, Mr. John Butler, of Tooley-street, that the structure in question was not a building within the meaning of the Building Act, that it had been constructed many years and had small iron wheels or rollers by which it could be moved from place to place, and that it had been brought to the defendant's yard, and removed from one part of the yard to another within the last two years.

It was admitted that the structure in question was used as a counting-house, that there was no fire in it, but that it was possible to have gas or lights burnt therein.

Mr. Traill, the magistrate, said, looking at the dimensions of the building and the purposes for which it was applied, and which probably would require the use of artificial light and possibly heat, he considered that it was within the description of objects intended to be provided for by the Act of Parliament, and convicted the defendant in a penalty of 15s., and 42s. costs, for neglecting to give notice to the surveyor, and ordered the building to be amended in conformity with the first section of the first schedule of the above named Act.

PARISH ASSESSMENT ON A RAILWAY COMPANY.

At the Lewes Quarter Sessions, on Tuesday last, an appeal was heard against an assessment made by the overseers of the parish of Playden upon the South-Eastern Railway Company, in respect of a portion of the Ashford, Rye, and Hastings Branch Railway, and some surplus land in that parish.

Mr. Johnson (specially retained), with Mr. Gates, instructed by Mr. Rees, the Company's solicitor, appeared for the Company.

Mr. Ryde, surveyor to the Company, proved that the rateable value of the railway in the parish was less than £17 10s. per mile (a sum at which the Company were willing to be assessed). Mr. Whately, auditor of the traffic accounts, and Mr. Chubb, accountant to the Company, proved the correctness of the accounts which had been supplied to Mr. Ryde, and upon which his estimate was based.

Mr. Ashcroft, the engineer to the Company, Mr. Cudworth, their locomotive superintendent; and Mr. Mansell, their carriage superintendent, were also in court, but were not called.

A correspondence between Mr. Ryde and the parish officers was read, to show that the company had offered to be assessed at the rate of £17 10s. a mile for the railway, and £5 for the surplus land.

The court ordered the rate to be amended by reducing the assessment upon the railway from £80 to £16 (being at the rate of £17 10s. a mile), and on the surplus land from £18 to £1.

They also adjudged the parish to pay the costs of the Company, which amounted, after they had been reduced by taxation, to £161.

Correspondence.

LICHFIELD CATHEDRAL CHOIR SCREEN.

SIR,—I hope that through the medium of your interesting paper you will allow me to state that the statues of angels at Lichfield Cathedral, spoken of in your paper of November 22nd, and again on the 29th, in a letter by "Vindex" referring to the same statues, and bringing them to the notice of Mr. John Bell, the eminent sculptor, in proof that the highest order of sculpture is in harmony with Gothic architecture, were designed and executed by me for Mr. Skidmore, of Coventry.

R. L. BOULTON, Sculptor.

Worcester, December 24th, 1861.

JOINTING ELLIPTIC ARCHES.

SIR,—I wish again to draw your attention to a subject which was discussed in your paper a few months since.

Your correspondent "W. Y." then pointed out the method adopted by P. Nicholson for drawing the arch joints. Now with a view of reducing the amount of labor which the adoption of that method entails I have devised a simple plan by which the operation is reduced to a mere mechanical one. It may be described as follows:—

Two bars, (*af, bg*), with grooves down their centres, are fixed so as to revolve each round one of the foci of the ellipse, *ab* respectively; they are connected by a pin, *d*, which slides in the grooves of each, to which is attached a rhomboidal framework (*efijh*), moveable at all its angles, two of which, *h, i*, are so united as to slide in the grooves.

It is easily seen that if the pin is placed on that point of the curve at which it is required to draw the joint, the line joining it, and the extreme angle, *e*, of the framework is the line of such arch-joint.

The two foci are the points from which the ellipse would be described by means of a cord—a method well known to workmen.

The ellipse for the extrados can easily be described in this manner:—the depth of the

voussoir must be set out on the base line, xy , and a line, y/h , drawn parallel to one from x to the crown, will cut off on the vertical through the centre the depth of the keystone; the foci of the ellipse can then be found by describing from the centre, A , a circle of radius, oy , which will cut the base line of the arch in the points required, if the ellipse is to be described with a cord, but if the trammel is employed no such construction will be necessary.

H. JARVIS, JUN.

GENERAL NEWS.

THE HOURS OF RAILWAY ENGINEERS.—A meeting of railway engineers and railway engine-drivers took place in the neighbourhood of Manchester on Christmas day, to consider the propriety of forming an association for the purpose of shortening the hours of railway engine-drivers. It was stated at the meeting that the country had derived the greatest benefit from the operation of the Ten Hours' Bill in factories, and were grateful to the men who promoted it. Such a movement was wanted for the engine-drivers on railways, and it was hoped that when the public saw the engine-drivers were in earnest themselves upon the subject, they would willingly come forward to assist in the cause. The association was formed, and the meeting separated.

NEW PLASTIC COMPOSITION.—According to the *Engineer*, Mr. J. S. Manton, of Birmingham, has recently patented an invention which is destined to effect a revolution in the material of which many articles of manufacture have hitherto been made, besides introducing a new plastic composition, capable of infinite application to the fine arts. The composition consists of mineral, earthy, arenaceous, or other like substances; animal shells of any kind, such as pearl or oyster, powdered glass or pebbles, marble, slate, basalt, slag, &c., are some of the substances used. These, being powdered, are mixed in certain proportions, and are amalgamated, under great heat, into a paste. In this state the material is capable of almost any application. It can be transferred to dies, and takes the sharpest possible impression of the most delicate ornament. It can be produced in almost any color, and acquires a surface equal in polish and finish to the finest ivory, whilst it is pleasant and agreeable to the touch. Ornaments, picture frames, inkstands, chess and draughtsmen, fancy articles of every description, and buttons in any size or pattern, are a few of the uses to which the material can be applied.

COAST BAROMETER INDICATORS.—Captain Washington, the Admiralty hydrographer, has addressed to the Lifeboat Committee an interesting letter on the working of the barometers and barometer indicators erected at three stations on the Northumberland coast. He found that seafaring men were taking an increasing interest in them, and paying more attention to the information thus afforded. He gives instructions for several alterations with a view to making the instruments more conspicuous at a distance; and recommends that they should be illuminated at night, and that no port should be without one. We hope that the recent storms will furnish a sufficient motive for carrying out these important suggestions.

ARTIFICIAL STONE.—According to a patent just obtained by Mr. F. Ransome, of Ipswich, for the manufacture of artificial stone and cement, he proposes to mix broken or powdered chalk with the silicates of soda or other alkali, and mould the compound into blocks or shapes afterwards. When the blocks or shapes are dry and hard the surface is washed over with a solution of chloride of calcium, or other soluble salt of an alkaline earth, or with a solution of chloride of aluminium or iron, in order to ensure as far as possible the conversion of the soluble silicate into an insoluble silicate of lime or other alkaline earth, or of aluminium or iron. It is preferred in producing artificial stone in this manner, that the chalk should be in a finely powdered state, and that it should be mixed with a solution of silicate of soda, so as to produce a plastic mass; the silicate of soda being such as is now commonly employed in the manufacture of artificial stone, and by preference of a specific gravity of 1.700. The proportions of materials by weight are as follows:—Of chalk, 5 parts; quick lime, 1; solution of silicate of soda, sp. gr. 1.700, 1; diluted with water to work to the consistence required. Or, chalk, 2 parts; slaked lime, 1; sand, 8; clay, 1; silicate of soda, sp. gr. 1.700, 2. Or, sand, 8 parts; clay, 1; quick lime, 1; solution of soluble silicic acid, sp. gr. 1.700, 2. If the mixtures are required for use as cements or plasters they should be mixed thinner, and the solution of soluble silicate should be of less specific gravity. These compositions should be moulded or applied as soon as they are mixed, as they set rapidly.

COST OF IMPROVEMENTS AT LYONS.—The Lyons journals publish a statement of the cost of the improvements effected in that city since 1854, including not only the sums expended there by the state, the department, and the city, but also by the railway companies, private individuals, &c.:—1. The improvements in the centre of the town, Rue Impériale, Rue Centrale, Rue de l'Impératrice, Rue Grenette, adding 70,000 square metres to the public thoroughfares, 35 millions of francs; 2. The making of new streets in the 3rd arrondissement, and improving old ones, 10 millions; 3. Creation of a park of 100 hectares (250 acres), and public works, 4 millions; 4. Water service, sewers, and paving, 15 millions; 5. New thoroughfares for facilitating communications with outlying quarters and the faubourgs, 5 millions; 6. Quays and works to prevent inundations, 16 millions; 7. Markets, 3 millions; 8. Municipal buildings, 10 millions. Total, 98 millions. In the above are not included considerable works executed with the ordinary resources of the city budget. To give a correct idea of the money expended in improvements at Lyons since 1854, there must be added—works executed by the railway companies, for carrying their lines through the town, 75 millions; and 280,000 square metres of private buildings erected within the last seven years, estimated to have caused an outlay of 20 millions.

BAR IRON.—A remarkable specimen of wrought-iron has lately been produced by the Butterley Company, at their iron-works, near Alfreton, consisting of bar iron 11 inches wide rolled in groove rolls. These bars were required in various lengths up to 47 feet long. These they resolved to roll in one length, in which they have succeeded in the most satisfactory manner; and one 57 feet has been produced, 11 inches wide, by $\frac{1}{4}$ ths of an inch thick. The bars were rolled off without the process of re-heating.

MANCHESTER FREE LIBRARIES.—The report of the four Manchester Free Libraries for this year shows an increase in their means of public usefulness, as well as an increase in the interest in which they are regarded by the public. The libraries have materially extended during the year, in a good measure from donations of books; and the mean daily aggregate of volumes put into the hands of readers has increased from 1,250 in 1860 to 1,960 in 1861.

IMPROVEMENTS IN BUILDING, &c.*

IMPROVEMENTS IN THE MODE OF, AND APPARATUS FOR, WARMING AND VENTILATING ROOMS AND BUILDINGS.—Dated May 24, 1861.—C. Batty.

This invention consists—1. In bringing the external atmosphere direct to the fire-grate, that the fire may be supplied with pure air, and without the assistance of the air in the room in which the fire is placed. The air is introduced into a chamber beneath the grate, where it is divided into several currents by flat bars or current directors, part of the air being conducted underneath the grate, and enters the fire at the bottom, and part is directed to the front of the fire to compress the smoke to the fire and cause it to be burnt. As the air which is supplied to the fire is independent of that existing in the room, there is no draught, as the air at or near the floor of the room is not used for the supply of the fire. 2. The bars of the grate are made much broader than usual, and are placed in an oblique direction, and serve to direct the air to the fire, and thus consume the gases generated by the same. 3. Part of the air supplied from the external atmosphere, as before described, is directed to a chamber constructed round the grate, where it is heated. The air thus heated is admitted and directed by suitable apertures or valves into the room, to warm the same, and causes a true circulation. A detailed description of the apparatus was given in our pages some time since.

CONSUMING AND DESTROYING SMOKE AS EMITTED FROM ENGINE OR OTHER CHIMNEYS, AND FROM ALL OTHER FLUES FROM WHICH SMOKE IS EMITTED.—Dated May 18, 1861.—R. King and K. Robson.

This invention consists in consuming or condensing the smoke from furnace or other flues, in such a manner that, when emitted from the shaft or chimney, it shall be comparatively colorless. The inventors propose drawing the smoke, as emitted from the furnace, by means of a fan, pump, or propeller, worked by any suitable power, through a down-cast pipe or tube into a vessel of water at the lower part of the chimney or shaft, so that the smoke, however dense, shall pass into or through the water, thus depositing the narcotic properties of the smoke at the bottom of the water, leaving the rarefied portion to pass upwards into the chimney or shaft, perfectly free from soot or other impurity, by which means, when such smoke is emitted into the atmosphere, it assumes more the appearance of steam, or almost a colorless vapor.

IMPROVEMENTS IN PORTABLE COOKING APPARATUS (A communication).—Dated May 23, 1861.—R. A. Brooman.

These apparatuses consist, 1, of a hollow upright, screwed into or otherwise fixed on a stand; upon the upright is a sliding collar adjustable by a thumb-screw, and formed with an eye for the reception of a pintle formed in a piece with or fixed to an open work plate or frame for the support of pots, pans, or of other articles requiring to be exposed over the fire. Sometimes a rod or bar, having hinged to the top of it a circular or other shaped disc to serve as a table or as a screen, is inserted in the hollow upright, and is adjusted to the height required by means of a pressure screw. The second apparatus consists of a stand carrying two frames, each of which supports a cranked upright, terminating at top in an eye, through which a horizontal bar is passed. On each of these bars is a running collar for supporting a plate or frame for holding articles requiring to be exposed to the fire, similar to the plate first mentioned.

IMPROVEMENT IN FLOORS.—Dated May 21, 1861.—R. Preece.

This consists in forming spring floors, especially suited for dancing on, by placing the sleepers or beams which support the joists upon blocks of India-rubber, or upon spiral or other suitable springs.

VENTILATING DWELLING-ROOMS, &c.—Dated 23rd May, 1861.—W. Tebbutt, Loughborough.

This invention consists of the arrangement and combination of parts constituting the apparatus constructed as follows:—In setting forth this invention the patentee proceeds to describe it as applied to a house or like structure. He premises, for convenience of description, that a house or other like structure is about to be built, and it is desired to ventilate the same. For this purpose he proceeds in the following manner:—In the floor level with the street he inserts a pipe extending from the front side of the house to the back thereof, and the ends of this pipe he covers from view by means of a pierced, plain, or ornamented grate, or in other suitable or convenient manner; and at about the centre of the length of the pipe he cuts away a portion thereof, and attaches a chamber, which is divided in two parts by a partition lying at right angles to the length of the pipe. To the upper part of the chamber he attaches a vertical pipe of the same diameter as the pipe or pipes in the floor; this vertical pipe he inserts in one of the walls of the building, or it may form a hollow pillar, where pillars are used to support the floor above. The top of the pipe or pillar projects into a similar chamber to the one appertaining to the horizontal pipe in the first floor; the end of the pipe or pillar stands up a few inches above the bottom of the chamber, and from the bottom of the chamber one or more pipes proceed to each room; the other ends of the pipes terminate in one or more orifices in the ceilings of such rooms. The upper part of the second chamber is connected to a similar vertical pipe or pillar as before mentioned. The pipes and chamber or chambers are repeated in each story. The vertical pipe or pipes is or are then continued from the top ceiling to the ridge of the roof, where it or they terminate a few inches upward from the bottom of a tube or tubes of a larger diameter, which projects above the roof outside. This tube is also surrounded with a still larger tube, the bottom of which is set a few inches clear above the roof, and the top is furnished with a cowl or cone to prevent any downward draught.

IMPROVEMENTS IN THE CONSTRUCTION OF SUSPENSION BRIDGES.—Dated May 29, 1861.—A. Ondry.

This invention consists in constructing suspension bridges in such a manner that, when any one portion of the platform or roadway is subjected to a greater burthen than other portions, it does not become distorted or put out of shape, neither is the structure itself liable to oscillate. The platforms of suspension bridges, as usually made, are connected to one or several flexible or jointed cables or chains, the whole being equally balanced under the weight of the structure, and being flexible are capable of being put out of shape; the action of an overload applied to one particular part of the platform alters the equilibrium and produces a distortion, and, consequently, a fresh equilibrium has to be found. The distortion is increased in proportion as the overload is applied to the platform of the bridge in a confined space; it is, however, decreased in proportion as the overload is applied to a larger portion of the length of the platform, so that, if this overloading is spread over the whole length of the platform, the primitive equilibrium will be practically maintained. So a suspension bridge, although made with flexible chains, would become a rigid bridge, provided the platform were sufficiently rigid to overcome any effect of partial or undue overloading. This invention further consists in preventing the suspension chains from losing their original curve, and although still flexible, they will not be deranged by an excessive or partial loading of the platform.

HARDENING AND PRESERVING STONE.—Dated June 6, 1861.—Jesse Rust.

For these purposes the stone is washed over with, first, a solution composed of caustic baryta, or bi-carbonate of magnesia, or both; and, secondly, it is washed over with a solution composed of fluoride of silica, or a fluoride of alumina.

APPARATUS FOR MAKING BRICKS.—Dated 6th June, 1861.—J. Platt and W. Richardson, Oldham.

This invention relates, first, to sifters or screens for clay intended to be moulded into bricks, and consists in directing a blast of air from a narrow opening against the outward surface of the said sifter or screen, so as to keep the meshes clear. Secondly, the invention relates to that part of the mould of brick machinery by which the pressure is given to the material, and consists in forming such part in two or more pieces, adapted to move independently of each other, so as to effect a slight opening for the escape of air, such pieces, however, being so arranged as to be capable of being forced forward simultaneously when desired.

TENDERS.

For a mansion, stables and lodge, at Westwood, near Leeds. Mr. George Corson, architect.

Excavators, Mason and Bricklayer.			
Pounder	£4,298 9	Wilson	£3,120
Moxon	3,250 0	Whitley	2,985
Carpenter and Joiner.			
Thorp	£2,884 15	Winn and Pawson	£2,059
Nicholson and Son	2,125 0		

Slater.			
Ellis	£306	Watson	£354
Croft	369		

Plumber and Glazier.

Story			
Webster and Son	£626 10	Water main pipe.	£128 0
	599 0		94 17

Smith.			
Bingley and Co.	£167 8	Nelson	£150 3 6
Green	165 0	Singleton and Tennant	113 19 0

Plasterer.			
Garlick	£466 0	Branton	£350
Wilson	439 6		

Painter.			
Simpson	£165	Jackson	£70 0
Hummerston	80	Wood and Son	67 7

* Accepted.

COMPETITIONS OPEN.

BRIDGE.

BRISBANE RIVER.—The Municipality of Brisbane are prepared to receive designs and tenders for the construction of a bridge over the Brisbane river, at Brisbane, the capital of Queensland. The author of the best design, at the lowest cost, will receive a reward of £150, or be employed to carry the work out, providing he furnishes sufficient proof of his competency and experience in similar undertakings. A premium of £80 will be awarded to the next best design, and £40 for the next best. The plans, specifications, and estimates of the first and second designs will be retained by the Corporation as their property. The remainder will be returned to the competitors; but the corporation will incur no responsibility as to their safe delivery. Each set of drawings, and the documents accompanying them, are to be distinguished by a motto only, and accompanied by a letter in a sealed envelope, marked with the same motto, and containing the author's name and address, and such testimonials as he may think proper to furnish. Professional judges, being non-competitors, will be appointed by the Corporation to determine the merits of the respective designs. Eligible tenders for the work, accompanying the design, will be entertained. All drawings and tenders to be delivered at Gresham House, on or before the 15th of March next. Copies of the instructions to competitors, and the plan of the city, can be obtained of F. Mangels and Co., the Colonial agents, and agents to the Municipality of Queensland, 86 to 88, Gresham House, Old Broad-street, London, E.C.

GASWORKS, &c.

MALPAS.—Plans, specifications, and tenders are requested for the erection of gasworks, meters, service pipes, and mains for the town of Malpas. The gasometer to supply not less than 250 lights. Plans, tenders, &c., to be sent to Mr. Wycherley, Malpas, on or before the 10th January.

CATTLE MARKET.

GLOUCESTER.—For designs for laying out and improving the present cattle market at Gloucester. Architects may obtain a plan of the site and particulars of instruction upon application to William McLandsborough, C.E. chamberlain of the said city. Corn Exchange, Gloucester, to whom the designs are to be sent, on or before the 11th day of January, 1862. The Council propose to give a premium of £25 for the plan selected, the plan to be the property of the Council, who do not bind themselves to carry out the plans, or employ the architect of such designs, but in case they do so the premium under such circumstances to merge into the commission, which will be £5 per cent. upon the outlay. If the plans sent in are not, in the estimation of the Council, of sufficient merit, the premium will not be given.

THAMES EMBANKMENT.

LONDON.—The Commissioners are open to receive plans for embanking the Surrey side of the river Thames, within the metropolis, which will conduce with the greatest efficiency and economy to the improvement, embellishment, and convenience of that part of the metropolis, will improve the navigation of the river, and will provide a public thoroughfare without stopping such trade as must be carried on upon the bank of the said river. Plans must be sent in on or before Monday, the 13th January.

CONTRACTS OPEN.

GAOL.

MONAGHAN.—For the alterations and additions to Monaghan Gaol. Plans, &c., to the 2nd of February next, at the gaol, and at the office of the architect, Mr. John McCuddy, 24, Westland-row, Dublin. Sealed tenders to be delivered at the gaol, before 3rd of February.

DWELLING-HOUSES.

DUMFRIES (N. B.).—For the mason, joiner, and other works required to erect and complete the following buildings on the Estate of East Tinwald, for Mr. Carthew Yorston, Esq.:—1. A dwelling-house and steading of offices on the Farm of Fernyleuch. 2. Two cottages on the Farm of Fernyleuch. 3. A dwelling-house and steading of offices on the Farm of Bruntshields. Plans, &c., with James Barbour, architect, Dumfries, to whom tenders on or before January 28th.

CHAPEL.

ABINGDON.—For the erection of the new Independent chapel, Abingdon. Plans, bills of quantities, &c., on application to the Rev. S. Lepine, Abingdon, to whom tenders are to be delivered by 12 noon on January 14th.

PARSONAGE.

IPSWICH.—For pulling down and rebuilding the parsonage of St. Mary-le-Tower, Ipswich. Plans, &c., with R. M. Phipson, architect, Museum-street, Ipswich, on and after the 27th December, and all tenders are to be delivered to him, sealed and endorsed "Tender for Parsonage," on or before the 7th January.

RECTORY.

RADNORSHIRE.—For building a rectory-house and offices at Norton, near Prestelgn, Radnorshire. Plans, &c., with Thomas Nicholson, F.R.B.A., diocesan architect, St. Peter's-square, Hereford. Tenders to be delivered to the architect, on or before the 18th of January.

SCHOOLS.

HASLINGDEN.—For the whole or any part of the works required in the erection of the New Wesleyan Schools, Haslingden. Drawings or specifications with Hayley and Son, architects, 45, Cross-street, Manchester, and at the vestry of the old chapel, Haslingden, from the 30th inst. till the Saturday following. Quantities from the architects on and after the 28th inst., or will be forwarded, post free, on the receipt of thirty postage-stamps; and sealed tenders are to be delivered to them on or before January 6th.

FOUNDATIONS, &c.

MIDLAND RAILWAY.—For the construction of the foundations, basement walls, and cellars under the Company's warehouse, to be erected at the St. Pancras Goods Station, London. Copies of the quantities may be obtained at the Engineer's office, Derby Station. The drawings and specifications may be seen at the above office, from the 1st to the 6th January; and at the Company's temporary office, Elm-ledge, King's-road, St. Pancras,

from the 7th to the 12th January (inclusive.) Sealed tenders, in one amount, to be forwarded to the secretary of the Way and Works Committee, Derby Station, not later than 10 a.m. on 14th January.

WAREHOUSE.

LEEDS.—For the erection of a warehouse in Park-place, Leeds. Drawings, &c., with T. Ambler, architect, 10, Park-row, Leeds, from the 13th to the 21st January. Tenders to be sent to Mr. Ambler not later than 12 a.m. on the 23rd January.

ALTERATIONS, &c.

KENT.—For certain alterations and repairs, additional buildings, stabling, and other works to be done at the Head Quarters Station of the Kent County Constabulary, Wren's Cross, Maidstone. Plans, &c., at the office of Mr. Martin Bulmer, County Surveyor, Westborough, Maidstone. Sealed tenders, endorsed, "Tender for Works at Wren's Cross," are to be delivered at the county surveyor's office, by four o'clock p.m. on the 6th January next; and persons tendering are to be in attendance at the Courts of Justice, Maidstone, at half-past 12 o'clock on the 7th January.

FARM BUILDINGS.

DEVON.—For the erection of a new farm house, at Halscombe, near Ide. Plans, &c., at Messrs. Daw and Son's offices, solicitors, Bedford-circus, Exeter, where tenders must be forwarded by the 1st of February.

MILITARY WORKS.

CORK.—For works of defence, including bomb-proof barracks, at Camden Fort, Cork Harbor, &c. Time for tenders extended to January 22nd.

FLEETWOOD.—For tenders, in detail, for the erection of a two-gun wooden battery, at Fleetwood. Plans, &c., on application at the Coastguard Watch-house, Fleetwood. Further particulars to be obtained from Commander Chapman, R.N., Morecambe, to whom all correspondence is to be addressed, and with whom tenders are to be lodged by Saturday, January 11th.

PATENT SLIP.

HULL.—For a patent slip, not less in size and capacity than the largest of the existing slips at Kingston-upon-Hull, for the use of vessels frequenting the port, for the directors of the Dock Company. A statement of the conditions may be obtained upon application to the secretary, W. H. Hufham. Accompanying these conditions is a form of tender, upon which only tenders will be received. Tenders must be sent in on or before 12 noon, of the 18th January, addressed to the secretary.

GASHOLDER, &c.

STALYBRIDGE.—For making and fixing a telescope gasholder (100 feet diameter), with the necessary columns, girders, &c., at the works of the Stalybridge Gas Company, Micklehurst, near Stalybridge. Plans, &c., at the Gas Office, Stalybridge. Sealed tenders, endorsed "Tender for gasholder," and addressed to the chairman of the directors of the Gas Company, Stalybridge, to be sent in not later than the 11th January.

AUSTRALIA.—For cast-iron pipes, bends, branches, syphons, &c., for the Adelaide Gas Company, South Australia. Specifications, at the office of Messrs. Filby and Co., 63, Fenchurch-street, E.C., London, between 12 and 2. All communications, by letter, to be addressed to the Company's agent, Mr. J. C. Lanyon, Jun., to care of Messrs. Filby and Co. Tenders to 10th January.

FUEL AND GAS FROM WATER.—Arrangements are being made at the Leeds Gas Works for the manufacture of gas from water, much on the principle carried out some years ago by Mr. White, in Manchester. Steam is decomposed in passing over incandescent coke or charcoal, and the liberated hydrogen is afterwards carburetted by being passed through resinous or other carbonising matter. The *London Review* says attention has recently been drawn to the use of water as a fuel. The employment of its vapor has already been utilised in metallurgy as an agent of oxidation in the roasting of certain minerals, particularly to facilitate the separation of arsenic and antimony compounds in metallic sulphurets. For several years attempts have been made to employ the calorific power of the hydrogen contained in water; and it is the same line of invention that Messrs. Maire and Voller have sought to utilise it as a combustible in industrial furnaces, and particularly in metallurgical operations. Water, fed in a regulated and intermittent manner into a hot fire, is decomposed into oxygen and hydrogen. The former gas unites instantly with the carbon, and the hydrogen, burning in presence of atmospheric air, produces a considerable heat in addition to that of the principal combustible. These results, then, a considerable augmentation of calorific without any addition of combustible, and, consequently, a more rapid fusion of metals and materials, and an economy of fuel which the authors of the process state varies from 40 to 50 per cent. Experiments and calculations have demonstrated that the heat absorbed by the decomposition of water is less than that furnished by the combustion of the gaseous products of the decomposed water.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism,"—*Morning Post*. Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications. WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favor us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

Jno. M. (Waterloo-place).—The result was not sent to us, or it would have been inserted in its proper place.

A. BUILDER (Yorkshire).—You have not stated the case very clearly; but we should say that no charge should be made against you. Is there no agreement?

R. L. B.—1. No reply has yet appeared. 2. We shall be glad to look at any matters you may wish to send us.

J. C. (Macclesfield).—Under consideration; probably in a few weeks.

K.—We cannot advise.

J. E. C.—Upon the statement, we think D. S. W. has no right to deduct the cost of alterations from the balance due.

AN INHABITANT OF THE NEIGHBOURHOOD.—We agree with you to some extent; but what proof have you that the "few feet" were originally stolen from the footpath?

G. V. B.—Index and title page will be ready shortly.

G. P.—Below our mark.

O. S. B.—In our next.

M. (Cambridge).—Received; too late for insertion this week.

E. J.—Should send further particulars.

W. R.—Not until the term of apprenticeship has expired.

A. SUBSCRIBER.—Yes, if suitable; let us see promised photograph.

Mr. JOHN.—Shall appear.

A. Z.—In type.

B.—a.—Before long.

*All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Bowell-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Bowell-court.

THE YEAR'S PROGRESS.

ALMOST the first thing that will strike the reader, on his glancing backwards over the art-history of the year just ended, will be the remarkable and painful contrast which it presents with its predecessor, 1851. Then we carried to a pre-eminently successful issue a great experiment—the International Exhibition. We were in the fourth decennium of uninterrupted peace in Europe. We had seen a gathering of all nations in bloodless contests and in useful rivalry. We boasted that we had taught the nations of the earth their true interests, so that thenceforth they would close

the Temple of Janus, beat their swords into ploughshares, disband their armies, transform their floating citadels into merchant clippers, forsake the art of war for the arts of peace, and inaugurate an era of “universal brotherly love.” In 1851 we believed in the maintenance of universal peace—to-day we fear a universal war. It would be to repeat a thrice-told tale to relate how these hopes have been disappointed—how all these predictions have been falsified. In the short space of eight years we have seen two European wars, two great

European empires prostrate in the dust, and driven to revolution or reform, not by moral suasion, but *vi et armis*. A nationality has been raised from the tomb where it had slumbered for centuries, and a sixth Great Power called into existence by war. We have seen English dominion in the East threatened by the rebellion of its armed defenders, which ended in consolidating our rule, and made our Queen Empress of India. The swords of England and France have opened China to the world's commerce, and we are now fated to behold a heart-rending contest between two branches of the English family, while for weeks past we trembled lest, with all our precaution, we should be drawn into the contest. On the other hand, and notwithstanding these wars, we have witnessed a development of material prosperity among nations which the most enthusiastic believer in human perfectibility would not have ventured to predicate ten years ago. We have added more than a million and half to the resident population of the three kingdoms, besides upwards of two millions who have left us—stimulated to emigrate by the gold discoveries—for new worlds, there to add to the foundations of new English empires. There must be nearly four millions of our race more than there were ten years since, and our trade has more than doubled in that period, for our exports have risen from seventy millions in 1851 to £165,670,653 last year.

The decennium just closed has been a truly epic one; it has been an heroic period. Its annals will read more like the books of an Homeric poem than like the chapters of matter-of-fact history; for the landmarks of nations have been changed, new empires planted, and the destinies of races altered. Yet, while these great things were doing, and have been done, no poet, sculptor, painter, or architect has been inspired to celebrate them in verse or by the arts of design. The arts of peace have not kept pace with the arts of war; or, perhaps, we should say, they have entered on divergent paths, never to associate again. Few will regret the divorce, if war be left to its brutal and bloody realities, and art reserve her idealising and glorifying powers for those achievements which conduce to the happiness instead of to the destruction of men.

If we are right in surmising that neither Calliope nor her sister Graphia will henceforth make the deeds of Mars the themes of their works—at least, not in England—it must not be forgotten that the change of direction in the workings of art is due in some measure to one whose loss we still mourn. There is no doubt that, with our national instincts, wars dictated by patriotism or undertaken for the defence of honor and freedom, will always command our sympathies and support. But the public mind happily distinguishes between wars of this nature and those which spring from lust of conquest, a thirst for glory, or a desire to realise ideas. So far as he was permitted, the Prince Consort led public opinion into this new channel. Without ceasing to take a lively interest in our national defences, he never condescended to play at soldiers, but directed the energies of his mind to the advancement of art and to the promotion of social happiness. On the last occasion of his appearing in public, he asserted his belief that “whatever tends to foster a taste for intellectual

enjoyment must also exercise an important influence on national progress and national prosperity.” If anything could increase our regret at the irreparable loss recently sustained by the nation it would be that it should have occurred before his Royal Highness had had occasion to display an interest in the advancement of architecture as active as that which he displayed in the progress of the sister arts, and of which premonitory signs were exhibited in the inauguration of the Industrial Museum at Edinburgh; for whatever the progress of our art may have been during the last twelve months, never was the want of a controlling spirit and of an impartial guide more felt than now. On all sides the condition of the profession is admitted to be unsatisfactory.

Besides the great question of æsthetics, which divides it into two parties, petty personal jealousies and individual rivalries spring to the surface, and set the profession in an unfavorable light before the world. Since the time of poor Haydon the public has not been vexed by quarrels and bickerings between painters or between sculptors. Even literary men, forgetting the traditional example of the “Quarrels of authors,” have learned the wisdom of the adage *que l'on doit laver son linge sal chez soi*. Architects, alone, seem incapable of composing their differences, and of refraining from unfriendly criticism upon the works of their brethren. The election of a president to the Institute was made the battle-field between Classicists and Gothicians. It seems to have been accepted by mutual consent as an arena for a trial of strength between the two parties; Mr. Tite was proposed by the Council, and was accepted as the Champion of Classic architecture. Mr. Beresford-Hope, was the champion of the Gothicians. The two gentlemen representing extreme views in architecture were set up in opposition, and Mr. Tite elected by a majority of fourteen; the numbers being sixty-five to fifty-one and but little more than half the number of electors voting. If the result be claimed as a triumph for the Classicists, it shows the Gothicians to be in greater force than was perhaps thought, and may encourage them to discipline their numbers and bring up their reserves next time. It is no more than justice to the President to state that he has exhibited moderation in his uses of victory.

It is, perhaps, to the division of the profession on æsthetic principles that we owe the non-settlement of the diploma question. Whether diplomas will ever be established, or whether, if established, they will ever be valued by the public beyond the price of waste paper, are matters into which we need not go, except to remark in passing that the attempt to make civil engineering a close profession by means of Putney College and its diplomas, signally failed without apparent detriment to the public. But there is no doubt that the question ought to be settled and that speedily.

According to the statements of advocates of diplomas, the profession is jeopardised by the intrusion of unqualified practitioners, the social standing of architects is lowered, and the public placed at the mercy of incompetent persons; if so, all the more urgent is it for the Institute to decide on the institution of examinations and diplomas, or what other fences may be deemed desirable to exclude incompetency; for, by postponing their decision, it is quite possible the whole scheme may be defeated.

The Copyright Bill introduced by Government at the early part of last session might have been made conducive to the interests of architects, if the profession had been united and properly represented. It may give pain to say so, but it is, nevertheless, true, that neither the Institute nor its Council sufficiently represents the profession. They cannot be fully entrusted, under the present system of organisation, with the care of architectural interests. This has led to a proposition for the amalgamation of provincial societies with the Institute and Association, but that, like the diploma question, made but little progress towards solution. That architects should have a bond of union, a platform common to all, and an organisation which will enable them to speak as one man on occasions where they are concerned, most people will admit. The only difference of opinion is, as to how it is to be effected. Amalgamation is beset with difficulties. There are so many individual susceptibilities that would have to be consulted, and such a variety of interests to be safeguarded, that we look on the task as one of the greatest difficulty.

In appealing to the Institute to investigate the causes of the decay of stone employed in the construction of the New Palace at Westminster, and to examine the remedies suggested by Mr. Ransome and others, the First Commissioner of Public Works and Buildings would appear to have forgotten that in the provincial Architectural Associations there is available an extended knowledge of building stones, and a practical acquaintance with their use. There could be no harm, and it would have been no more than a well merited compliment, to have asked all the Architectural Societies of the three kingdoms to have examined the subject, for some new light might then have been thrown upon it. The committee appointed, by the Institute and in which leading engineers, chemists, and geologists were associated,

undoubtedly did their best, and they are hardly to be blamed if they left the question where they found it. They have added nothing to our knowledge of the causes of decay, and they were "decidedly of opinion that the discovery of a proper mode of treating stones in a state of decay had not yet been made," and that there is no evidence that "the decay has been prevented by any of the processes yet applied"—conclusions scarcely worth the trouble they cost to arrive at.

We must defer some additional remarks until next week.

MONUMENT TO THE PRINCE CONSORT.

NOTHING could be more natural, or could better testify to the widespread feelings of respect for the Prince Consort, than the proposals recently made in various quarters to erect a monument to his memory. That an enduring memorial of his worth, and evidence of the national esteem in which he is held should be erected, we are all agreed; but there is some difference of opinion respecting what should be the character of the memorial. Ultra enthusiasts of every hue trot out their respective hobbies with more apparent desire to outstrip competitors than is befitting the melancholy occasion. One wishes national subscriptions to be made to flow into the exchequer of the South Kensington Museum, in order that it may thereby be rendered independent of Parliamentary grants, and be erected into an "Albert Institution for the Art Education of the People." Others put forward the claims of philanthropic establishments, hospitals for every variety of disease, reformatories, and ragged schools; while, in the columns of a daily journal, the matter is settled for us off-hand, and an obelisk, we are told, is the most artistic and appropriate monument that can be suggested. It would have been preferable if these amiable enthusiasts had remained silent until after the first burst of national grief had subsided, or if they had ridden their hobbies in private; but as they have, with reprehensible indelicacy, thrust themselves forward, and, in fact, sought to pre-occupy the ground with their pet schemes respectively, it becomes a painful duty for journalists to dispel delusions and set the matter in its true light before the public.

The nation will not allow the loss it still grieves over, to be made the opportunity for gain by philanthropists or educationalists. There is something so revolting and unfeeling in propositions of this nature, that one might well be surprised at their having been made, if it were not well known that enthusiasts are callous, where the feelings of others are concerned, and totally oblivious of the decencies of life, when it is a question of bringing out their particular hobby. Philanthropists should carefully avoid doing aught that might tend to their being confounded in popular opinion with selfish traders on woe; for it is difficult to draw the line of distinction between men who seek to turn a reverence for the dead into a means of gratifying greed for gain, or personal vanity. In both cases self is the mainspring. Although there can be no harm in connecting charitable institutions with the memory of the dead—if their supporters desire it—to act in the manner proposed, would be to charge the dead with the work of the living, and the "lamp of sacrifice," would be transformed into one of utility. In founding and supporting institutions for the cure of disease, ignorance, and crime, society does a work which if charitable, is also economic, and which is also in atonement for other duties neglected. Charity is a virtue the practice whereof is enjoined by divine authority. It is a feeble acknowledgment to the Giver of all Good of gratitude for his mercies. It is one of the means whereby the rich may work out their own salvation, and is, therefore, a double duty incumbent upon all who have the wherewithal to give.

The satisfactory progress made within the last half-century in the diminution of the rates of mortality, poverty, ignorance, and crime, is conclusive evidence that they are not the normal condition of certain classes of the community. Paupers and criminals, and disease are due to the *laches* of society. Where Dives diverts his talent to the gratification of his sensual desires, and allows his poorer brother to dwell in dirt, in rebellion against the principles of sanitary science, and without pure air, light, and water, then will Lazarus, loathsome to behold from disease, lie at his gate and beg. The duties of property are as clear and positive as are its rights. The Registrar-General's returns show that their fulfilment will reduce the rate of mortality, prolong the average duration of life, and diminish the sick rate. If property does not fulfil its duties it forfeits its right, and if it supports hospitals it does reparation very inadequate to atone for its previous neglect. Education is another of the duties of society, which cannot be neglected without loss and evil resulting. The present generation is bound to instruct the rising generation—parents to teach their offspring to know good from evil—and the community, in obedience to the dictates of self-interest, to provide the means for all species of instruction. Where this is not done there is a neglect of duty, and charitable contributions to schools or colleges are insufficient reparation. If English society neglects these duties it must not charge the memory of the dead with contributing to make reparation, as far as practicable, nor with bearing the burden of atonement. We must bear the load ourselves; we are wealthy enough to contribute all which, under the disguise of charity, may be asked from us to repair our neglect, and we can also afford to transmit to posterity a monumental record of the services to ourselves rendered by the Prince Consort, of our gratitude therefore, and of our admiration of his virtues.

For these reasons we conclude against a combination of utility, profit, and vicarious discharge of duties in any shape or manner as a public monument to the Prince. We object to the national tribute being devoted to establish an educational institute, model farms, hospitals, reformatories,

refuges, or museums *in memoriam*. We submit that art, or the sister arts, working by the lamp of sacrifice, should be enabled to erect a monument as enduring as it could be made, which should proclaim to future generations of men, by the eloquence of artistic forms, the national sentiment of the present day.

There is no objection to any class of philanthropists identifying the work they have in hand with the memory of the Prince Consort. By all means let them do so in their character as a class, and as an addition to the national memorial. Consequently, it would be a cause for much regret, if anything we have stated should be construed into disapproval of Mr. Cole's suggestions for carrying out the scheme devised by the Prince for establishing an industrial university. For the chief characteristic of the Prince was his sympathy with labor, which prompted his unremitting efforts to raise it in general estimation. But the industrial university would be for the advantage of the community. Its purpose is to augment our industrial superiority with a view to enlarge and consolidate our commerce, and in carrying it out we should not so much raise a monument to the dead, as we should lay the foundations of future manufacturing prosperity. By all means, therefore, let those who have an interest in the question, and the department charged with public education realise the Prince Consort's scheme. But let them guard themselves against the idea that by so doing they are erecting a monument to his memory. For disheartening as it may be to confess it, it is nevertheless true, that charitable endowments do not perpetuate the memory of their founders among society at large. How many pass by the Charter-house who never heard of Sutton? and it is the same with most of the noblest charities, while many have been mismanaged or improved, until they have fallen into oblivion. So true is this that Mr. Cole does not advocate the industrial university, except as supplementary to "other memorials of a monumental character."

Agreed upon this point, we are brought to consider the proposition for erecting a monument in the shape of an obelisk, to commemorate the Prince Consort's connexion with the International Exhibition of 1851. But the Prince did other things beside organise the Exhibition, which are quite as noteworthy, and equally deserving of commemoration. It is not to a particular action of his life we desire to do homage, but to his memory, taking him for all in all. Further, the proposed monument would be a work of supererogation; for, close to the site of the 1851 Exhibition—in the gardens of the Horticultural Society—is to be a public memorial of the Exhibition, surmounted by a statue of the Prince Consort—given by his son—in lieu of the statue of the Queen. We do not require duplicate memorials erected in the same locality, but one national monument in the metropolis of the empire, which shall be so intelligible in its character as to be comprehensible to all. With respect to the artistic character of the monument, which it has been endeavored to predetermine, a very great deal may be said against an obelisk as being the least suitable shape that could be adopted. It may not be so objectionable as a detached column, which is an isolated architectural feature set up without cause or purpose; but it is not an artistic form any more than a common milestone. Obelisks in Egypt have a fine effect, but that is due to the physical and atmospheric character of the country. A vast plain bounded on all sides by the horizon with scarcely an undulation, and whatever structures may be near not rising more than a few feet above the level of the soil admits of an obelisk being seen to every advantage, towering aloft in solitary grandeur, in a clear and luminous atmosphere, and with the horizon for a background. Here we have none of the conditions that conduce to the advantageous appearance of an obelisk, but many that militate against it. Sir Francis Chantrey pointed out many years ago the absurdity of erecting columns, and therefore obelisks, in London or other English towns, from the fact that they have to compete with and are lost among tall chimneys; and he spoke of Rome, where there are no chimney-shafts, as a suitable locality for monumental shafts. A column, and we have three of them in London, rising above the level of surrounded structures, surmounting by a statue or ornamental finial is more easily distinguished than an obelisk, which, so far regards as its artistic outline would be very inferior to many chimney-shafts; while, instead of the horizon for background, and clear atmosphere of the East, an obelisk in London would be reared against a background of trees, or dingy houses, and in an atmosphere of fog.

There is, of course, a precedent for employing obelisks as monuments. Sanehoniaton, wrote that the Phenicians and Egyptians consecrated columns to those who benefited mankind, and to the elements; but that may be questioned. Their real use was to serve as "Books of History." An obelisk without inscriptions would be purposeless and an absurdity. Yet who would venture to propose to incise the faces of an obelisk in London with inscriptions? Letters would be invisible, and hieroglyphics unintelligible. "But," it may be answered, "the story would be told on the base." In that case the obelisk would be a superfluity, for the base would be the monument, and what might be above would be a useless ornament, and therefore in violation of one of the first canons of art. The minds of such as adopt mere size as the chief architectural standard of beauty are struck by reference to the St. Petersburg monolith, which is 84 feet long, and, with the base, rises 154 feet high. We could certainly obtain quite as respectable a monolith from the granite quarries of this country, for Mr. Robert Hunt told the Society of Arts in 1859 that he was quite satisfied a monolith 90 feet long could be quarried here, and Mr. Bellamy stated on the same occasion that Mr. Freeman had reported that he could supply from Cornwall a monolith 120 feet long, by 14 feet on the sides. But, however much the dimensions of known obelisks might be exceeded, the result would not be a work of art.

We submit that a monument to the memory of one so universally

esteemed and regretted should be a work of fine art—the highest that can be obtained, and that it should exhibit that combination of the sisters which Mr. John Bell has so eloquently advocated in these pages. We shall not now obtrude suggestions as to what the character of the monument should be, although we may venture to express the hope that architecture will not, as hitherto, be placed under ban and interdict, but may be permitted to provide a home for the monumental sculpture. It would, perhaps, prevent much ultimate disappointment, and satisfy the longing of the nation to pay the highest honor that can be offered, if public competition were invited as the surest mode of obtaining the best design. In that case it might be desirable to depart from the ordinary course, and invite those who wished to compete to send in their names. From this list a committee would select half-a-dozen of those who appeared to be most competent to supply designs, for which ample remuneration would be made, and the author of the best employed to carry it into execution.

THEATRICAL SCENERY.

MR. W. CALCOTT'S "Transformation Scene" at Covent-garden Theatre, when first presented to the public, was much more complicated than it now appears; it is, however, still complete in itself, and very effective. At the commencement the stage is thrown into darkness. As the first gauze rises an indistinct view of a cavern is obtained; gradually some shells on banks of dead gold, constituting the foreground of the picture, become visible, after which they present a more positive appearance by the dark blue of the water near the foreground. A second gauze is now raised, and shows an extensive cavern, painted in gradations of the warm, dull color in the front, also another tint of the water. A third, an intervening medium, is removed, and the scene is enriched with a rising bank of green and gold between the two pieces of water, at each end of which an arch gradually ascends towards the roof, the cavern bearing fossils in gold; a brilliant light being thrown upon them the splendour of the scene is greatly increased. Two large shells afterwards appear, bearing a female figure in each of them very elegantly dressed, and illumined by a most dazzling light. The general effect is now a contrast of vivid green, among which is distributed a large portion of dead gold. In the middle distance, and the centre of the stage, a large mass of plant of fern-like leaves slowly ascends, becoming gradually brighter than the shells at the sides; and now the plan of the scene becomes more generally developed by all the objects being reflected in sheets of looking-glass lying in the foreground, surrounded by the bank and shells already described, the sheets of looking-glass being intended to represent tranquil water. When the centre object has risen to the intended height, the front of it slowly opens, and descends until it forms part of the scenery below. A female figure has been enclosed in this ornament, and the descending form containing looking-glass, adds the reflection of her figure to the rest of the scene. The brilliancy of the light is now diminished in gradations on the surrounding objects, and all the most vivid rays are focussed upon the centre figure. The white gauze dress of this figure, from its local color and its textural quality, being incapable of reflecting bright light, forms an excellent contrast to the vivid green, brilliantly illumined, by which she is surrounded, and which is at the same time, both delicately and effectively opposed by a pink scarf thrown across the shoulder. The pink scarf forms the complementary color to the blue, green, and yellow of which the rest of the scene is composed, the whole of which is completed by some naiads appearing as floating on the water, while the roof of the cavern over the foreground is composed of dull green fern-leaves, branches and portions of the cavern itself. After the audience have had time to enjoy the general effect, the whole is changed, by green light being turned on, and it gives both a cool and elegant aspect to the design. A red light then mingles its rays with the blue, which produces a striking contrast between the front and the back of the scene, the red light ultimately assumes the ascendancy, and the curtain falls upon this last effective change.

The scene is highly creditable both to the artist and the management.

ART DESIGN AT THE INTERNATIONAL EXHIBITION.—The following minute of the Art Designs Committee of the International Exhibition of 1862 has been forwarded for publication: "Her Majesty's Commissioners for the Exhibition, being desirous of exhibiting the progress of art designs for manufactures, would be glad to receive contributions from possessors of drawings and models by British artists executed within the century 1762-1862. Artists, designers, and manufacturers in general are hereby invited to send works, suitably framed and glazed, or if of large size on strainers, properly prepared for hanging. Designs in all departments of art industry capable of reproduction are admissible in this class. Designs for glass and ceramic wares, precious and other metals, furniture and carving, plastic decorations, and other objects in relief; also designs for textile fabrics, paper-hangings, mural decorations, tiles, mosaics, inlays, stained, painted, and decorated glass, &c. Assistance from the possessors of drawings and models by such artists as Chambers, Adams, Soane, Stothard, Flaxman, Pitts, Pugin, Wyon, and others, is especially desired; and the committee trusts that the holders of such works will communicate with the secretary as early as convenient. Illuminations of an original character will be admitted into this department. All works must be delivered for the inspection of the committee, on or before the 31st of March, at the South Kensington Museum (office entrance).

THE INTERNATIONAL EXHIBITION.—Mr. F. R. Sandford, the Secretary of the Commissioners of the International Exhibition, authoritatively contradicts the statement, which has been circulated, that her Majesty will open the Great Exhibition in person.

NOTES FROM PARIS.

A CORRESPONDENT, "C. H. D.," notes, among other matters, that all that block of the *cité* bounded by the street of the same name, the Boulevard de Sevastopol, the Quai Neuf du Marché Neuf, and the Rue Constantine, is in course of demolition. Those who wish to give a parting glance to this interesting portion of old Paris have no time to lose, for most of the expropriated buildings have been abandoned, given up to the contractor, or shut up. This ground, to be the site of new barracks, was at one time the industrial centre of the capital; there were three churches there. St. Germain-le-Vieux, in the Rue de la Calandre, fronting the Rue aux Fèvres; St. Pierre des Fossés, where stood subsequently the Convent des Barnabites, of celebrated memory; and St. Martial, situated at the end of the impasse de St. Eloi.

This last church, demolished in 1722, gave way to a house which, up to the revolution, served as a presbytery for the curate of Saint Pierre-des-Arles, a neighbouring parish. It still exists. The Rue de la Calandre which we now find so narrow and cramped up, was at one time the Bond-street of Paris. Every cortège from the Palace to Notre-Dame passed through it. In the group of buildings to be cleared away figures the Rue des Cargaisons, barred up since 1825; in 1700 it was known as "La Rue de la Femme ecartelée," its width varies from 1m. 10c. to 1m. 76c. At one extremity of this street opens the celebrated Rue aux-Fèvres, described in the "Mysteries of Paris;" in its present state none of the *tapis francs* or *coupe-gorges* exist, as it had many years ago undergone a transformation; the noisy tavern of the *Lapin-Blanc* was transformed into a fantastic gallery or saloon, if we can believe the following lines inscribed on the walls outside:—

Pour nu musée n'allez pas à Versailles.
Le Lapin-Blanc vous offre ses murailles,
Couvertes de rimailles,
Et de caricatures,
Qui railles.

The poetaster was evidently not ashamed to sacrifice the grammar of his country to the exigencies of rhyme.

The exterior boulevards of Paris proceed actively; already they are opened out from Montmartre to La Chapelle, and continue to be pushed forward from the ancient Barrière of Clichy as far as that of Monceau. They are expected to be completed very shortly. These "circular" boulevards are really beneficial in a sanitary point of view, as, when they are well planted, they will become veritable magazines of oxygen, yielding forth their daily supply.

In the *Moniteur*, about three years ago, there was an account of some very interesting experiments made by M. Nadar, the photographer, of Paris, upon his first ideas of acrostatic photography applied to planispheric plans, whether for civil or strategical purposes. Long before the American journals began to speak of the acrostatic telegraphic apparatus worked by electricity the above artist had completed two machines, one working up in a balloon at a lofty altitude, and another at the surface of the earth, the communication being, of course, instantaneous.

The Roman baths of Périgueux, discovered some four years ago, are still an object of attraction to visitors. Situated in the plains of Campagnac, perhaps they are the first remains of importance which have been found in so complete a state. Paris possesses the Julian Baths, &c.; but, up to the present time, no one has had an opportunity of examining the internal dispositions of a vast establishment of Roman baths with details such as are revealed by the excavations at Périgueux. We have no positive information as to the precise epoch of their construction, yet it may be presumed that they are of Roman origin. In support of this an altar of early construction bears the following inscription, in characters of the second century:—

In order to accomplish a vow, Marcus Pompeius, priest of the god Mars, freeman by birth, of the tribe of Quirina, son of the sacred priest Caius Pompeius, consecrated this altar to . . . and to . . . Apollo, after having repaired at his expense the temple of the tutelar goddess and the public baths, which had fallen into a state of dilapidation.

The above altar is now in the ruins of the Château de Beaufort, belonging to the Commandant of Beaufort, who has collected all the objects discovered, and who shows them to visitors with the utmost courtesy.

RAILWAY TRAVELLING.—Mr. William Hawes has addressed the following letter to the *Society of Arts' Journal*:—"Mr. Baker, in his paper on this subject, assumed that constant daily railway travelling produced injurious effects on the health of railway travellers. He also suggested that the injurious effect was less in second-class carriages than in the first-class, and less in third than in second. I will not now stop to inquire whether his view of the cause of the result he affirms be correct, but I hope you will allow me to request that our *Journal* may be used as the means through which facts on this important subject may be collected, and, when collected, compared and analysed for the benefit of the public. The first step in such an inquiry is, to collect facts, and this can only be done efficiently if a large number of railway travellers will be good enough to answer, with care, a series of questions compiled with a view to elicit information on this very interesting question. With your permission I will submit a series of questions to the readers of the *Journal*, and if those whose experience enables them to do so will be good enough to forward their replies to the office of the Society, addressed either to the secretary or to me, I will undertake to publish the results in the *Journal*, as soon as my time will permit:—

1. Do you travel daily, or nearly so, by railway?
2. How many miles each day?
3. State the hours of travelling and of your meals?
4. For how long a period have you been travelling regularly?
5. Which class do you travel by?
6. Have you found any inconvenience from this regular railway travelling, and, if so, of what nature?
7. Do you sleep while travelling, and, if so, does sleep in a carriage refresh you—as, for instance, in a chair?
8. Do you read, or otherwise employ your time during your journey, or did you do so at one time, and have to give it up?"

ORIEL WINDOW OF THE PARSONAGE HOUSE OF ST. SEBALD'S, NUREMBERG.

AT the north-west corner of the square in which stands the fine church of St. Sebald's, Nuremberg, is the Parsonage-house, the remarkable feature of which is the very beautiful oriel window represented in our engraving.

Famed, as Nuremberg is, for its ecclesiastical and domestic buildings (in the latter to such an extent that an ancient author—Æneas Sylvius—declares that “a simple citizen was better lodged than the King of Scotland”), this oriel window holds a foremost place for the beauty of its design, and its bold and highly sculptured detail. It was probably put up during the reign of Charles IV., about 1361.

The five bas-reliefs represent incidents from the Bible—as the Adoration of the Magi, &c.

The painted windows are said to be the work of Hirschvögel, a famous artisan of the city, who first established there the art of enamelling pottery, in 1507.

The rest of the house to which it is attached is plain enough; it was once the residence of Melchior Pfäuzing, author of the poem of “Thever-Jank.” He was a canon of the church of St. Sebald.

SCOTLAND.

Dumfries and Maxwelltown Mechanics' Institute.—The new hall of this Institute, in Irish-street, Dumfries, was opened on the 12th ult. The style is Gothic, of the Early English period. The front elevation to Irish-street is 62 feet long—its leading feature consisting of three large entrance doors with pointed arches, and a circular tracery window under the main gable. The arches are built of white and red stones alternately. The height from the ground to the apex of the gable is 46 feet. The internal arrangements of the building are simple. The three front entrance doors open into a lobby 30 feet long, from which access is had to the ground floor of the hall. At the one end of the lobby is the stair up to the gallery, at the other end is an ante-room for cloaks, &c. The total width of the ground floor of the hall is 58 feet, and its length is 56 feet (exclusive of the platform, which is at the end opposite the front doors, and is 33 feet long by 11 feet wide). The gallery is placed opposite the platform, and extends over the entrance lobby; it is 23 feet deep, and 33 feet wide, and gives the total length of 76 feet from the back of the platform to the back of the gallery. The roof of the building is in three compartments, dividing the interior into a central nave and aisles on each side. The nave rises above the side aisles to the height of 34 feet, and is constructed of eight laminated wood ribs, in the form of pointed arches, springing from iron columns, which give a vaulted appearance to the interior. The ribs of the nave are carried down the lower roofs of the side aisles, and terminate on stone corbels in the walls. The roof of the nave, rising above that of the aisles, allows the light to be introduced through a range of clerestory windows on each side. The ceilings are plastered and formed into panels and geometric figures by intersecting mouldings. The ribs, &c., are grained oak, and are finished on the spandrels with polychromed trefoils and shields, which are filled in with the initials of great men of the past and present day. The plaster panels and mouldings are tinted variously to harmonise with the wood-work. The gallery front consists of an open ornamented iron railing, bronzed, and lined behind with crimson cloth. At night the hall is lighted with ornamented brackets, hung from the beams of the gallery and nave. At present it is seated for 1,000 people; but if occasion requires, it can be arranged to hold 150 more. The cost of the building is about £1,300. The design was furnished by Mr. Fraser, architect, Dumfries. The contractors were—for the mason work, Messrs. Crackstone and Son; for the joiner work, Mr. Mein; for the plaster work, Mr. Fraser; and the slater work, Mr. Bridges. Mr. Coltart had the painting, and Mr. Aitken the glazing.

Sick Children's Hospital, Edinburgh.—The plans for the alterations proposed on the house at Meadowside, prepared by Mr. David McGibbon, architect, have been approved by the directors and medical committee. According to these plans, in the main building there will be two large wards, each 56 feet 9 inches by 15 feet 4 inches, capable of containing together about 24 patients. In a separate wing to be built to the west of the present house, there will be two wards, each 25 feet by 22 feet, and together suited for 12 patients. These wards are intended for fever patients, and are to be placed so as to form a separate department entirely shut off from the rest of the establishment. There will also be one or two small wards for special cases, giving in all about forty beds. Each of these departments is to be complete in itself, with separate bath-rooms, &c. The ventilation has also been particularly considered, and the plan recommended by Miss Nightingale will be adopted. The windows of the wards being chiefly to the south, will have the benefit of a sunny and cheerful exposure. The entrance is to be towards the south, with a large hall and a wide new staircase. Next to the entrance on the ground floor there will be a large day-room, in which the children who are sufficiently recovered will be able to play when the weather does not admit of their being out of doors. The grounds round the building extend to about one acre. The alterations are to be begun in May next, and are estimated to cost, with the purchase-money, about £4,500.

New Town Hall, Rutherglen.—The buildings of the new Town Hall are in the main street, immediately to the east of the parish churchyard. They have a frontage of 61 feet to the street, and a depth of 79 feet 6 inches. The ground floor is occupied by a spacious entrance-hall and a lofty staircase, which conduct to the Town Hall on the upper floor, and to a court hall in the rear of the buildings, the front portion of the ground floor being arranged for two double shops. In the treatment of these shop-fronts the architect has endeavoured to overcome the injurious effect which so often attends the introduction of shops into a public building. The public hall measures 75 feet by 40 feet inside; it extends over the shops and lower hall, and is lighted on the west side by five large four-light mullioned and transomed windows, and on the south by a large oriel of six lights. The ceiling of this hall is composed wholly of dressed timbers, stained and varnished. It is semicircular in section, divided into compartments by arched, coupled beams, springing from impost shafts, with foliated capitals, attached to the side walls and arranged in couples under the arched beams. The exterior of the building is in the Scottish baronial style, quaintly varied and ornamental in its details. The shop windows have round, arched heads, with string mouldings

encircling them, and indicating the division of the floors. The centre of the front is occupied by the large oriel, which seems almost to fill the end of the hall. It is projected on elaborate corbelling from between the arches of the ground floor, and is panelled and ornamented with escutcheons and armorial devices. The angles of the building are crowned with bartizan turrets, with high peaked conical roofs. A high pitched gable occupies the centre of the front over the oriel, in the centre of which is a panel carved with the armorial bearings of the burgh, and on either haunch of this gable a carved lion and unicorn is placed, the apex being finished with a pile of armor, bearing the Scottish crown. The other panels in the front are carved with the armorial bearings of England and Scotland, and with ornamental devices displaying the charters of the burgh, granted by David I., 1136; William I., 1189; Robert I., 1324, and James V., 1542.

The entrance door is at the east side of the front, under the tower, and forms a prominent feature of the elevation, from its size, the character of its arch and jamb mouldings, and its position under the plain solid mass of the tower. The height of the building from pavement to apex of centre gable is 72 feet, the entire height of the tower is 110 feet. The tower is very plain in the lower portion, above the doorway, but becomes broken in outline at the top; the angles are terminated with bartizan turrets with domed roofs, the walls between being terminated in crenelated gables, with clock dial-plates in each side. The dials of the clock, we believe, are so designed that the hands and figures will appear white at night on a dark dial, and the reverse during the day. Mr. Muirhead, of Glasgow, is the maker. The contractors are,—for the mason work, Mr. Lawrie; for the carpenter work, Mr. Lindsay; for the plumber work, Mr. Lockhart; for slater work, Mr. Morrison; and, for the plaster work, Mr. Gilately. Mr. Robert Balfour is the clerk of the works. The works are being carried out from the designs and under the superintendence of Mr. Charles Wilson, of Glasgow.

THE THAMES EMBANKMENT.

AMONG other points Mr. Thwaites has suggested the following for consideration by the Commission in reference to the embankment of the south side of the Thames:—

“Assuming the necessity for a southern embankment to be conceded, it may still be useful to consider, at the outset of our inquiry, the prominent reasons for such a work, as in some degree indicating the course which may most advantageously be pursued.

“The plan already reported on for the northern side demands the removal of very large quantities of deposit from the shoals in the river, many of which immediately adjoin the southern shore; this operation will have a great tendency to cause a constant settlement towards the deepened portion of the river's bed, and consequent injury to the piling, wharf walling, and other defences on that side; some of these are already old and decayed, or were originally but imperfectly adapted to their situation, and hence we may conclude that it will be necessary to provide a solid wharf wall along all that part of the southern shore which fronts the embankment previously recommended.

“But there is another urgent reason for the southern embankment, which must exercise a considerable influence on the framing of any scheme for that side, viz., its liability to constant injury from flooding. The extent of this evil, its heavy pressure on the large laboring population of the parishes adjoining the river, the misery, sickness, and death produced by its periodical recurrence, with the consequent heavy charges on the rates, can only be thoroughly appreciated by those who have themselves witnessed its effects. Obviously to carry out thoroughly any effective remedy, the future embankment must be of sufficient height to be above the reach of the highest tide—viz., 16 feet above ordnance datum, and it should be at least conterminous with the thickly inhabited portion of London beyond the Thames. Its precise limits will depend upon the evidence hereafter to be laid before the Commission, but the termination of the embankment already carried out by Her Majesty's Office of Works in connexion with Battersea-park and bridge, might form a convenient commencement on the western side. Some difference of opinion will probably exist as to its extent eastwards, but it must be remembered that London-bridge forms neither a moral nor material limit of the metropolitan area: the inhabitants of Bermondsey and Rotherhithe suffer equally from floods with those of Lambeth and St. Saviour's, and are equally contributory to metropolitan burdens.

“The third head of inquiry is the improvement of the means of communication in connexion with the embankment. The new street in course of formation by the Metropolitan Board of Works, taken as a continuation of Stamford-street and the York-road, will form a very complete inland line of traffic from east to west; but, valuable as it is, increased facilities to the great transport trade on the southern bank, from Nine-elms to London-bridge, are urgently demanded. True, along certain portions of this bank several excellent links are found, such as that afforded by the Commercial and Belvedere-roads, and less completely by Bankside; but the defective sections adjoining Lambeth Palace, thence to Vauxhall, and between Blackfriars-bridge and Bankside, greatly need amelioration.”

BARRACKS AT CHELSEA.—Great progress is being made in the erection of the new barracks for the use of the Guards on the grounds adjoining Chelsea Hospital. When ready for occupation they will be capable of accommodating 1,000 men. In addition to detached houses for the officers and non-commissioned officers, the buildings will comprise separate dwellings for the married soldiers, a library and reading-rooms, a lecture-room, ball courts, gymnasiums, skittle grounds, baths and washouses, a provost prison, guardhouse and lock-up, canteen, and quartermasters' stores. The soldiers' quarters, which form the main portion of the building, are in a very forward state, and the officers and non-commissioned officers' quarters are already roofed in.

SOUTH KENSINGTON MUSEUM.—The South Kensington Museum was closed on Wednesday evening, the 1st inst., and will remain so on each Wednesday until further notice. The free open evenings are now Mondays, Tuesdays, and Saturdays, until 10 o'clock. The last day has been substituted for the Wednesday suppressed. During the week ending 4th January, 1862, the visitors have been as follows:—On Monday, Tuesday, Wednesday, and Saturday, free days, 8,665; on Monday, Tuesday, Wednesday, and Saturday, free evenings, 4,713. On the three Students' days (admission to the public 6d.), 924. Total, 14,302. From the opening of the Museum, 2,421,233.

THE NEW FINE ARTS COURTS, SOUTH KENSINGTON MUSEUM.

THE first portion of the permanent buildings of the South Kensington Museum will shortly be completed. The public will find therein another opportunity of sitting in judgment upon Captain Fowke's powers, and professional men another target for criticism.

We are no partisans of Captain Fowke. We have criticised his works, but we have done so fairly and honestly. We cannot turn our backs upon the arcades of the Horticultural Society, which do not, to say the least of them, suffer by comparison with those of Mr. Sidney Smirke—to strike a blow at Captain Fowke's reputation through works which he did not design, and we do not refuse him a place amongst architects because he has had the advantage of a scientific education. We wish to judge of the executed designs quite irrespective of the consideration that the author of them is or is not a regularly-trained architect. A good design by even an amateur is far more acceptable than an indifferent one by a recognised professional man. In this spirit, we proceed to describe Captain Fowke's recent work at the Department of Science and Art.

It is scarcely necessary to remark that the whole of the buildings now constituting the Museum were meant to be but temporary structures. The contemplated front towards the main road consists of two wings, with a curved receding central feature in the Italian style. This will eventually supersede the block of shanties which now fringe the thoroughfare.

The permanent Museum has, however, been begun at the north-east corner of the site, to the north of the Iron Museum, and to the east of the Turner, Vernon and Sheepshanks galleries. This first instalment comprises a Northern and a Southern Fine Art Court, with offices to the east of them on the ground floor, and picture galleries above. The South Court is the one first reached from the northern extremity of the "Boilers." It is 114 feet wide by 110 feet long. There is a passageway running down the centre, which leads to the Northern Court. This passage is flanked by coupled spiral iron columns, with relieved ornament on central bands. They support an upper open corridor immediately over the lower passage. Right and left of this passage are the two divisions of the Southern Court, covered by an arched glazed roof of wrought-iron ribs, which spring from the columns of the upper corridor to the walls on the other sides. These roofs have each a span of 45 feet; rafters are laid upon them, and a lantern, 16 feet wide, having louvres on each side of it for ventilation, occupies the centres of both roofs.

At the far end of each division corridors run east and west from the upper corridor before referred to, and communicate with galleries beyond the flank walls of the court. These transverse corridors are carried by iron columns similar to those before mentioned. The caps are foliated, without being copied from the stock Corinthian patterns.

The whole of the columns stand upon pedestals, or rather the lower portions of the columns are bricked round up to the level of the moulded bases, and then covered with cement to form pedestals. The flank walls of the courts are pierced by a series of arched openings, with circular medallions in the spandrels, connecting the court with the rooms on either side of it. These arched openings are of the height of the columns which support the gallery. Each bay in the upper stage is subdivided by a Corinthian column, standing over the keystone, into two flank arches.

The height of the court is 18 feet to the springing of the wrought-iron ribs, 32 feet to the feet of rafters, and about 45 feet to the underside of ridge. The passage in the centre has ornamental gratings in the floor covering the warming pipes. The floor above is Fox and Barrett's iron and concrete fireproof flooring. The roof of the upper corridor is arched with raking rafters, similar in principle to the large ones beside it.

A door in the centre of the wall at the far end leads into the Northern Court—a spacious and imposing apartment 110 feet square, without a column or pier of any kind, from wall to wall. Nothing obstructs the view of its great extent. The skill with which it has been roofed, without appearing heavy or oppressive, enlists our warmest admiration. At a quarter space from all the four walls lattice girders, 10 feet high, run at right angles with each other. The ends of the girders rest on columns, so that they are supported quite independently of the walls. They meet in four strong iron standards, and thus divide the roof into nine compartments, all hipped, and glazed with Hartley's rough plate. The central compartment is 55 feet square, the four on each side of it 55 feet by 27 feet 6 inches, and those at the four angles 27 feet 6 inches square. Over the door, between the courts, the beautiful marble gallery, from the church of Santa Maria Novella, which was bought at Florence a few years ago by Mr. Robinson, and which at the time attracted no inconsiderable amount of public interest, has been permanently fixed. On either side of it workmen are building against the wall models of the famed doors of the Florence Baptistery.

The whole of the brickwork to these courts has been laid with Captain Scott's cement, and the walls are coated with the same officer's patent plaster, which is as cheap as ordinary plaster, and sets as quickly and is as durable as the best Portland cement. It is manufactured by Lee and Sons. There are eleven segment-arched openings on each of the side walls, thus extending the area of the court under the adjoining galleries. The floors are laid with asphalt.

Retracing our steps, mounting a staircase, and passing along the open corridors of the Southern Court, we enter the galleries at the eastern side of it. There are two in number, placed parallel to each other, with an open arcade between them. The light in these galleries is admirably arranged. An ordinary glazed roof seems to cover them, but by means of

longitudinal beams between the tie-beams the ceiling is divided into compartments. The central portion is glazed by flat sliding sashes filled with ground glass, whilst ornamental iron panels, through which a subdued light enters, is introduced into the side compartments. These are divided one from the other by foliated concave trusses, which rest on the imposts of the arcade, and abut upon the tie-beams. The galleries are beautifully proportioned, and, as we have said, admirably lighted, whilst the small amount of architectural decoration is most judiciously disposed. We have seldom seen better modelling or casting than that shown in the trusses, and the iron ventilating panels have also a decided artistic stamp upon them. This is due, we believe, to the personal superintendence of Mr. G. Sykes, now attached to the Department of Science and Art, and formerly master of the Sheffield School of Art. The floor is Fox and Barrett's. These upper galleries are warmed in a novel way. The concrete is removed, at intervals of some 20 feet, from between iron joists, and the warming pipes supported by iron cradles fixed between them.

To the east of the North Court, on the same level as those we have just mentioned, four new galleries will eventually be built, but one only is at present in course of erection, and that is insufficiently advanced to enable us to judge of its future appearance.

Taken together, these new works at South Kensington are highly creditable to Captain Fowke. He employs wrought and cast iron extensively, and in a novel fashion, and he seems to have had ever present in his mind the destination of the courts. The efficiency with which he has warmed, ventilated, and lighted them is as conspicuous a facility with which he disposes of huge girders, and introduces decorative novelties.

The works have been executed entirely by Messrs. Kelk and Co.; Mr. Coates is the clerk of the works. Messrs. Kelk's foreman is Mr. Poynton.

WORKS ON THE LONDON, CHATHAM, AND DOVER RAILWAY.

THE works on the West-end Extension of this railway are of considerable magnitude, and consist of $4\frac{1}{2}$ miles of cuttings and embankments, $1\frac{1}{2}$ mile of tunnel, and 4,262 feet of viaduct, making together $6\frac{1}{2}$ miles. The City Extension line is to consist of 1 mile of cuttings and embankments, $3\frac{1}{2}$ miles of viaduct, a bridge over the Thames, crossing close to Blackfriars-bridge, making together about $4\frac{1}{2}$ miles of line; a goods' station by the water side, and a passenger station at each side of the river. On the West-end Extension the works are in a more advanced state than those on the City Extension. Near the point of junction at Battersea about 60 acres of land have been secured, upon part of which coke sheds, and a semicircular building for housing 21 locomotive engines, with repairing shops to the rear, have been completed. Extensive ranges of buildings are in course of construction, in which suitable machinery will be fixed for manufacturing engines and other rolling stock for the railway, on a similar plan to that adopted at the Wolverton establishment of the London and North Western Railway Company. Some of those buildings are in a forward state, and with the present rate of progress the whole will be completed in the course of a few months. A portion of the main line from its junction with the Pimlico line has been laid out for about one-third of a mile to the point where the viaduct commences. The greater portion of the brickwork has been completed between that point and the intended station at Dulwich, and the whole of this work is expected to be completed, and the iron girders erected over the roads, streets, and highways which the line crosses, in about nine weeks. The brickwork of this portion comprises a viaduct of 17 arches adjoining the Wandsworth-road, a viaduct crossing the Clapham and Bedford roads about 1,000 feet in length, and a viaduct at the Manor-rise on the Brixton-road of 1,600 feet in length, making together 3,110 feet of viaduct. These viaducts for the greater portion of their length are constructed on a circular plan and have been very substantially executed. The uniformity in the color of the bricks, and the workmanlike manner in which they are put together, form a striking contrast to many other works for a similar purpose. Of the works on the City Extension line, which branches from the West-end Extension line at the Dulwich junction, there is now completed upwards of a mile and a quarter of viaduct along the back of the gardens and houses in the Camberwell and Wandsworth-roads. About half the length of this viaduct has been ballasted, and the permanent way is being laid down. This viaduct is advancing at the rate of 60 feet in length daily, and is expected to be completed to a point near the Elephant and Castle by August next. The brickwork on this extension is also of the same good quality as that on the West-end line.

The works for the main line beyond Dulwich towards Beckenham junction are in course of construction. The chief work on this section is a tunnel upwards of a mile and a quarter in length, passing, as before stated, under the Sydenham Hill and the Brighton Railways. Seven shafts have been sunk from the top of the hill into the tunnel, and the excavation is carried on to the full size in both directions from each shaft, making 14 faces to work upon, and thus facilitating the progress very materially. About one-fourth of the tunnel has thus been completed, and the average progress of the tunnel is at the rate of 250 feet per month. So soon as a short length of the tunnel has been excavated to the full size, the bricklayers are set to work, and that portion so excavated is completed before any further advance in the excavation at that point is made. The operation is then repeated, and the brickwork is completed for a further length. The thickness of the brickwork varies from 19 to 14 half-brick, according to circumstances; the bricks are of the hardest kind, manufactured on the spot in great quantities by means of powerful machinery. All the bricks used are very hard and compact, and some of them, made by one machine in particular, are beautifully formed, very solid, presenting a polished surface of an excellent red color. It often happens that in the course of a fortnight the clay excavated and brought out of the tunnel is carried into it again in the shape of solid hard bricks. The improvements and experience of the past 20 years, have been brought to bear in providing materials and facilitating the progress of the works on these metropolitan extensions, and the result has been much greater than was anticipated. There are at present about 2,000 men and 250 horses employed upon the works.

THE PROPOSED NEW MUSEUMS AT CAMBRIDGE.

IN connexion with the proposal long under consideration to provide additional Museums and Lecture-rooms at Cambridge, the syndicate appointed in 1853 to confer with Mr. Salvin, and to instruct him to prepare suitable designs, have now reported to the senate, that—

"In their report, dated 31st December, 1853, and confirmed by the senate 8th February, 1854, they enumerated the various lecture-rooms, museums, and laboratories which appeared to them to be necessary to meet the requirements of the university, and they indicated the character of the buildings which it seemed advisable to adopt. In accordance with the recommendations of this report, Mr. Salvin prepared a plan and estimate in 1854, but, owing to the difficulty in obtaining the requisite funds, no steps were taken towards carrying it out. At the beginning of the present year a syndicate was appointed to examine the funds available for university buildings, and in consequence of their report various sums of money and stock, with the accruing profits thereof, besides an annual contribution of £1,000 from the university chest, were by grace of the senate, 25th April, 1861, specially set apart as a fund for the erection of new museums and lecture-rooms; giving a total which may at present be estimated at £27,000, and may be expected before the completion of the works to amount to upwards of £30,000.

Funds having been thus shown to be available for the commencement of the work, Mr. Salvin's plans were again taken into consideration, and it appeared that for various reasons it would be desirable and necessary to make many changes in the disposition of the buildings. The professors were requested to revise the statements of their respective requirements, upon which the former design had been founded, and Mr. Salvin has, at the request of the syndicate, and in accordance with these instructions, prepared an entirely new set of plans, accompanied by the estimate which follows.

These plans appear to the syndicate to be admirably arranged, and in every way to fulfil the various and complicated purposes for which they are designed. They are now submitted to the senate for their approval.

ESTIMATE.

	£	s.	d.
1. The building with front towards Freeschool-lane, containing two large lecture-rooms adapted to the requirements of the theological and literary professors.....	6,383	5	0
2. The central group of buildings, containing lecture-rooms for the Plumian, Lowndean, Lucasian, and Jacksonian professors, and for the professors of anatomy, mineralogy, and botany; rooms for philosophical apparatus, and private rooms for the several professors; museums of comparative anatomy, zoology, mineralogy, and botany, with a gallery for optical experiments, &c.....	19,692	6	0
3. Additional building for the chemical department.....	400	0	0
	£26,475	11	0

The above estimate is exclusive of the architect's commission and the salary of the clerk of the works. It is somewhat higher than that prepared by Mr. Salvin in 1854 for the completion of the plan then designed by him, but the difference is accounted for by the greater extent of building, and by the cost of the deep foundations and complete draining of the site, which were not included in the former estimate.

The syndicate, comparing this estimate with the amount of available funds above stated, are led to conclude that the principal part at least of the above-mentioned works may be commenced immediately; but as it may not be found advisable at once to complete the whole, they recommend that tenders be obtained, under the direction of the syndicate, and subject to the approval of the senate, as follows:—

1. For the completion of the whole works.
 2. For the completion, separately, of the building in Freeschool-lane, containing the two large lecture-rooms.
 3. For the completion, separately, of the central group of buildings.
 4. For the additional building of the chemical department.
- The syndicate beg to accompany their report with a detailed account of Mr. Salvin's plans, by Professor Willis.

(Signed)

GEO. PHILLIPS, V.C.	R. WILLIS.
W. WHEWELL.	G. G. STOKES.
H. W. COOKSON.	F. FRANCE.
JAMES CARTMELL.	JOHN LAMB.
W. H. MILLER.	

The following is a description of the designs, prepared by Mr. A. Salvin, in conformity with the instructions of the lecture-room syndicate* :—

The proposed buildings are arranged about a quadrangular court, 138 feet from the north to south, and 114 feet from east to west, and occupy about three-fifths of the old botanic garden. The outer walls of the quadrangle are separated from the irregular eastern and western boundaries of the garden by a space of about 40 feet in breadth, and are in closer proximity to the northern boundary, but the south front is 150 feet from Pembroke-street, leaving space sufficient for a future building in that street if required. This front consists of two square masses or towers connected by a lower building, having a carriage archway in the centre. The western tower has the lecture-room of the Jacksonian and the botanical professors on the ground floor, and that assigned to the Lucasian, Plumian, and Lowndean professors above.

The apparatus-room and private room of the Jacksonian professor are contained in the lateral one-storied appendage on the west side of the tower; and the apparatus and private rooms of the three last named professors extend along the upper story of the intermediate building, the lower floor of which is occupied by the museum of philosophical apparatus.

The natural sciences are disposed in the remaining three sides of the quadrangle, human anatomy excepted, which is retained in the buildings especially erected for its reception in 1831. Chemistry also remains in its ancient position. In the new quadrangle botany is placed on the ground floor of the west side, in contiguity with the lecture-room which it shares with the Jacksonian professor; mineralogy on the first-floor, having its lecture-room at the north end. Comparative anatomy occupies the east side of the quadrangle, with a museum on a single floor, of which it is proposed at present to erect only about one-half. Its lecture-room, dissecting-rooms, &c., are placed on the

ground floor of the eastern tower, and in the lateral one-storied building which corresponds to the Jacksonian appendage at the other extremity of the façade. Above the lecture-room of comparative anatomy is the zoological museum. The north side of the quadrangle is reserved for geology, whenever it may be required to remove it from its present position beneath the university library. Thus the natural sciences of botany, mineralogy, geology, comparative anatomy, and zoology, will be placed in a connected series of museums.

The theological and literary professors—namely, those who require neither museums, laboratories, or other appendage to the lecture-room, except a small private room, are located in a detached building at the entrance-gate in Freeschool-lane. This building contains two lecture-rooms, one on the ground floor, 39 feet by 32 feet, which will seat 250 persons; and another on the upper floor, 48 feet square, capable of accommodating more than 400 persons. There is also a spacious double staircase to the latter lecture-room, and an entrance corridor which leads to the buildings of the principal quadrangle. Beyond this corridor, on the left hand, is a building which projects from the north end of the quadrangle. Its ground floor contains rooms for a porter or keeper of the buildings, below the private rooms of the mineralogical professor.

It must be remarked that any of the lecture-rooms in the building may be employed as examination-rooms, by the contrivance of applying desks in front of the rising benches.

The report of December 31, 1853 recommended that "the style of the buildings be as plain as possible, and the material brick; that there be no unnecessary expenditure upon architectural decoration; but that the architect be requested to display his skill rather in the perfect adaptation of the various apartments to their use, and in their convenient juxtaposition," &c. Accordingly, the only portions of the proposed buildings in which architectural symmetry and decoration are employed are the south front facing Pembroke-street, and the west front in Freeschool-lane. These are designed in a simple and suitable Italian style, capable of being carried out in brick with stone dressings. The remainder of the buildings within and without the quadrangle are of plain brick.

The apartments respectively assigned to the professors have been arranged in conformity with written reports of their requirements, originally furnished by these gentlemen at the request of the syndicate, contained in the report of December 31, 1853, and revised by them during the present year. It remains to explain in detail the manner in which these requirements have been embodied in the present plan.

The Lucasian professor is placed at the south-west corner of the upper floor of the building. His lecture-room has a western and a southern outward wall, in each of which is a window especially formed for the reception and management of a heliostat. The one in the west wall corresponds to an opening or horizontal trunk through the rising seats, by which the solar ray may be directed upon the lecture table. The remaining windows are provided with shutters that can be conveniently closed when the lecturer desires to exclude light. Contiguous to the east wall of the lecture-room are two rooms, one for private study and delicate apparatus, the other for the storage of frames and unwieldy lecture apparatus. Both of these are lighted from the south, and the doors of communication so arranged that the heliostat ray from the west window of the lecture-room may be transmitted into them if required. The rooms have also a separate entrance from the staircase without.

A loft for optical experiments is arranged in the roof of the western range. It consists of a long narrow gallery or garret, extending from the north gable to the staircase at the south end of that range. A ray of sunlight received upon the mirror of a heliostat placed at a window in the south wall of the lecture-room, is transmitted directly through an opening in the north wall, and thence over the staircase into and along the gallery. The total distance from the heliostat to the north gable of the gallery is 220 feet. Near the north extremity of the gallery its width is increased, by a transept in the roof, for the convenience of arranging apparatus. Access to the gallery is obtained by a flight of steps from its southern extremity, which descends to the landing of the lecture-room staircase, and thus ut once to the rooms of the Lucasian professor. In consequence of the difference between the height of the museums in the western wing, in two stories of 12 feet each, and of those of the lecture-rooms, which are 20 feet high, the floor of this optical gallery is only 6 feet above that of the Lucasian apartments.

The lecture-room of the Lucasian professor is also assigned to the Plumian and Lowndean professors of astronomy, and three rooms, lighted from the south and connected with the lecture-room by doors opening into a short passage, are intended for the private rooms of the Plumian and Lowndean professors, respectively, and for a common apparatus room.

Upon the roof of the lecture-room tower a clear flat uncovered area, 15 feet square, surrounded by a parapet, is constructed, which is reached by means of a staircase next to the lecture-room. The transverse division-wall, which separates the lecture-room tower into two portions, is carried up to the level of this platform, so as to serve as a foundation for two stone slabs upon which astronomical instruments can be placed for students' practice in observation.

The Jacksonian professor is provided with an apparatus room of the same dimensions as that which he at present occupies in the old building, and in addition with a private room that may be used as a workshop and unpacking-room.

The Museum of Philosophical Apparatus is placed on the ground floor of the central portion of the façade. Three rooms, of a total length of 80 feet, are assigned to it, and it is conveniently accessible from the Jacksonian lecture-room, and also by means of the staircase at the north-west angle, from the apartments of the professors on the upper floor. This museum is introduced in accordance with the report of the lecture-room syndicate, December 31, 1853, and is intended for the reception of models, machinery, and apparatus of all kinds that admit of being disposed in order for public inspection. It must be furnished with glass cases and other convenient fittings, in which the various professors of physical and mechanical science may deposit those portions of their apparatus which are suitable for public inspection, and which may also serve for the reception of such instruments of philosophical research as may become the property of the University by gift or purchase.

The Botanical Museum occupies the great part of the ground-floor of the western side of the quadrangle. It consists of two rooms, respectively 62 feet and 35 feet long and 24 feet broad, lighted by windows on the west side. Its entrance is at the north end. At the south end is placed the private room, unpacking-room, &c., of the professor, which is in communication with his lecture-room, held in common with the Jacksonian professor.

* The plans will be suspended in the council chamber of the Fitzwilliam Museum for the inspection of the members of the senate.

The upper floor of this side of the quadrangle is appropriated to the mineralogical professor. His museum is placed in two rooms, each 63 feet long and 24 feet broad, with windows on both sides. His lecture-room is at the north end of the museum. A staircase, constructed between the north boundary-wall of the ground and the gable of the building, leads up to a passage on the east side of the lecture-room and museum, and thus, by two doors, gives independent access to them. A short wing projects from the west side, and contains the professor's laboratory, apparatus-room, and private room. The latter, from the peculiar nature of his observations, requires considerable length. It has at the west end a window with a bracket for a heliostat, the ray from which can be transmitted along a distance of 38 feet within the room, or beyond it through a door so as to reach the lecture table.

The lower story of this wing (partly fitted up as a porter's lodge) also contains a small laboratory for mineralogical students.

The Museum of Comparative Anatomy is placed on the eastern side of the quadrangle. In dimensions it is 100 feet long and 40 feet broad, which, according to the professor's statement, will be sufficient to hold the present collection. Its position on the ground, however, admits of a future elongation to the extent of 80 feet. To facilitate this, it is proposed to construct the gable with a large archway, closed by a wall. Thus whenever the additional structure is completed, this wall can be readily removed, and the whole will be laid in one.

On the south of this museum is placed the lecture-room, 43 feet by 32 feet, in contiguity with which is the professor's room, 21 feet by 18 feet; also a room, 26 feet by 15 feet, for dissections, mounting skeletons, &c.; a servants'-room, and a spare room for stowing packing-cases, and objects in preparation for the museum. These rooms are contained in the lateral one-storied wing of the façade, and are all well lighted and are in communication with the back-yard on the east of the museum.

The room above the anatomical lecture-room is assigned to zoology.

It is proposed that the chemical professor should retain the present Jacksonian lecture-room, and also occupy the room now appropriated to the Jacksonian professor, as well as the rooms to the north of it which were erected for chemistry in 1831, and that these should receive the addition of an upper story to the north of the lecture-room, with other necessary alterations, to adapt them to the present state of the science, and for the reception of students in practical chemistry.

The designs are contained in the following plans, sections, and elevations, drawn to a uniform scale of 8 feet to the inch:—

1. Ground-plan of the whole site and of the proposed buildings. This includes the existing lecture-rooms, &c., at the south-east angle, the walls of which are distinguished by a dark tint, and the proposed alterations in them by a pink tint.
2. First-floor plan of the building in Freeschool-lane, containing the great lecture-room; the ground-plan of this is included in No. 1.
3. Plan of the upper story to be added to the existing chemical buildings, for a students' laboratory.
4. First-floor plan of the buildings of the quadrangle.
5. Longitudinal section of the south range, including the Jacksonian and Lucasian lecture-rooms, with the platform for astronomical observations on the roof over them, the museum of philosophical apparatus and the private and apparatus rooms of the professors above it, the lecture-room of comparative anatomy and the museum of zoology.
6. Transverse section of the west range, including the botanical museum, the mineralogical museum, and the optical gallery in the roof.
7. Longitudinal section of the west range, to show the relative levels of the above museums and gallery to the Lucasian lecture-room, and the manner in which the solar ray, indicated by the red broken line, is transmitted through the openings in the walls of the lecture-room into the gallery.
8. Plan of the optical gallery.
9. Elevation of the south front.
- 10, 11, and 12. West elevation, east elevation, and transverse section of the building in Freeschool-lane.
- 13 and 14. Block plans to explain the general distribution of the buildings.

LONDON ASSOCIATION FOR THE PREVENTION OF STEAM BOILER EXPLOSIONS.

A LONDON Association is now in course of formation, having for its object the prevention of steam boiler explosions, and the effecting economy in the raising and use of steam. A similar institution has existed for six years in Manchester, under the presidency of Mr. W. Fairbairn, who, we learn, is also the president of the association now forming, and during that time a very large number of boilers have been submitted to the inspection of the officers of the association.

It appears from the published rules that the district to which the operations of the Association shall extend shall be that part of England south of a line drawn across the country from east to west, through and including the towns of Yarmouth, Rugby, Warwick, and Aberystwith.

That the members of the Association shall consist of subscribers to the funds of the Association, and shall be divided into two classes—viz.:—1. Persons who place steam boilers under the inspection of the Association. 2. Persons who do not use steam boilers, or do not place them under the inspection of the Association.

That an annual meeting of the members (consisting of not less than ten members) be held in the month of January each year, at which they shall elect a president and council for the management of the business of the Association.

That the expenses of the Association be met by an entrance fee of two guineas, and an annual subscription from all members of one guinea; and from members having boilers inspected by the Association, an annual subscription for each boiler in regular or occasional use upon the works of the member, according to the following scale of charges:—

1 boiler	30s. per year.	6 and 7 boilers . . .	19s. each per year.
2 and 4 boilers . . .	25s. each per year.	8 and 9 boilers . . .	18s. each per year.
4 and 5 boilers . . .	21s. each per year.	10 and above . . .	17s. each per year.

That the entrance fund be, as far as possible, reserved by the council for the purpose of promoting such experiments and investigations as may tend to throw light upon the causes of boiler explosions, or may otherwise promote the objects of the Association.

That the duty of inspecting the boilers and steam-engines of the members,

and all apparatus pertaining thereto, be discharged by one or more competent engineers, aided by a sufficient number of local inspectors, to be appointed by the council.

That it shall be the duty of each engineer to give to the members, free of cost, information and advice with respect to the various forms and constructions of boilers, steam-engines, and all apparatus appertaining to them, so as to guide the members to the safest and most economical means of raising and using steam.

That the duty of the inspectors shall be to visit periodically, under the direction of an engineer, the steam department in the establishments of the members in their respective districts, to examine the boilers, safety-valves, feed apparatus, and other parts on which safety depends; and, when ordered by an engineer of the Association, to note the steam pressure and consumption of fuel, and to report the information obtained in writing to him.

That in all cases of inspection, by an engineer or by an inspector, a report in writing shall, when required, be made through such engineer to each member whose works have been so inspected, specifying the facts and results, with such remarks as those facts suggest.

That the facts and practical results obtained in the course of inspection shall be classified and recorded in books open for the inspection of members, at the offices; but in all such records each firm shall be designated by a number, and the names of firms shall only be given with their consent.

It is pointed out that the members and promoters of the Association are not to derive any pecuniary benefit from its operations, but have solely in view the promotion of an object of great public importance.

It is worthy of note that Mr. Fletcher, Chief Engineer of the Association at Manchester, lately examined 315 engines and 436 boilers, 6 of the latter being examined specially, 8 internally, 22 thoroughly, and 400 externally, in which the following defects were found:—Fracture, 2; corrosion, 25 (2 dangerous); safety-valves out of order, 7 (2 dangerous); water-gauges ditto, 9 (3 dangerous); pressure-gauges ditto, 6; feed apparatus ditto, 3; blow-off cocks ditto, 40; fusible plugs ditto, 1; furnaces out of shape, 10 (3 dangerous); deficiency of water, 2; over pressure, 4; boilers without safety-valves, 1 (dangerous); total, 110 (11 dangerous). Boilers without glass water-gauges, 18; ditto without pressure-gauges, 19; ditto without blow-off cocks, 9; ditto without feed-back pressure valves, 39.

Now that steam power is being so largely introduced into workshops and manufactories, such an Association properly conducted cannot fail to be attended with beneficial results. We have only a doubt as to the rates of fees, which may deter some from availing themselves of the services of the officers of this Institution.

THE OBSTRUCTION AT THE EUSTON AND HAMPSTEAD ROADS.

SIR,—The inhabitants of the neighbourhood of Tottenham Court-road are very much exasperated at the manner in which the shop at the corner of the Euston and Hampstead roads is being re-erected; the old house has been for years a great nuisance to the neighbourhood, and particularly so to persons waiting for the omnibuses. That such an opportunity should be allowed to pass away without setting the house back to its proper place (in a line with the other houses in the row), has caused the loud complaints from the people living in the neighbourhood which we now hear, it being the opinion generally that the house should have been set back to the general line of frontage. There is some talk of petitioning the magistrates not to grant a license to the new house; such a proceeding would justly merit the approbation of all lovers of order and improvement.

AN INHABITANT OF THE NEIGHBOURHOOD.

WARM CLOTHING.—It is a mistaken idea to suppose that fabrics made of coarse wool are the warmest and most durable. Owing to the lower prices of coarse wool, fabrics of this material are usually made heavier than those of fine wool, hence their greater thickness deceives persons respecting their qualities for warmth and wear. There is no heat in the wool itself; its property of what is called "warmth" is due to its non-conducting qualities. If we grasp a bar of iron on a frosty morning it produces a disagreeable cold sensation, because it is a good conductor of heat, and the warmth of the hand is rapidly carried off by the metal. On the other hand, a piece of woollen cloth, especially if it has a long nap upon it, does not feel cold because it is a good non-conductor, and prevents the heat passing rapidly from the hand. Now the warmest fabric for clothing is that which is the best non-conductor, and Count Rumford made a great number of experiments with different materials in order to find out the best. According to his observations the down of the eider duck, which the Esquimaux use in their clothing, is unrivalled in this respect; and the finer the fabric of woollen cloth used, the more imperfectly did it conduct the heat from the human body. As fine woollen cloth is superior to that of coarse wool as a non-conductor, it is therefore the best for clothing in keeping the body warm during cold weather. We are also positive that cloth made of fine wool equal in thickness to that manufactured from the coarser material will wear much longer. The finest woollen cloth, although dearest at first, is cheapest in the end, because it is more durable and warmer; and, according to Liebig, so much heat saved is so much meat gained. It must not be overlooked, however, that there may be a very great difference between what is called "firm cloth" and cloth made of fine wool. Fine wool feels pleasant and soft to the touch, and it has a rich velvety appearance. There has been a great demand recently for coarse wool to be used in the manufacture of common army and other cloth, but every effort should rather be made to obtain plenty of cheap fine wool, because it is the warmest and best for clothing.—*Scientific American*.—A patent has lately been taken out for the manufacture or production of various waterproof articles of wearing apparel, in such a manner that they may be thoroughly ventilated, and egress allowed for the perspiration or exhalations from the body, while at the same time water is effectually prevented from passing through the garment. This is effected by perforating the garment or article in various parts, and adapting to each of these perforations a short tube, which passes upwards inside the garment or article.

THE EXAMINATIONS AT SOUTH KENSINGTON.

WE give the following from the examination papers just issued by the Science and Art Department at South Kensington.

Subject I. *Geometrical Drawing.* Subdivision II. *Mechanical and Machine Drawing.*—Examiner, Professor T. BRADLEY.

MECHANICAL AND MACHINE DRAWING.

N.B.—Where no scale is specified it is left to the candidate's judgment, but in every case he must specify the scale he employs. As ample time is allowed for the drawings the candidate is to make, they must be carefully finished and shaded sufficiently to express the forms. No credit will be given for any drawing not strictly complying with the conditions of the question.

Section I. and Section II. refer to the accompanying rough figured sketch (intentionally out of proportion) of a crab or windlass, the candidate to make from it the drawings specified in either of those sections, but not more than three from sections I. and II., and one only from each of the other sections.

Section I.

1. A front elevation.
2. A side elevation.
3. A plan.

Scale, $\frac{1}{4}$.

Section II.

1. A segment of the wheel comprising about six teeth and one complete radius. Scale, $\frac{1}{4}$.
2. The pinion, with a side elevation of it.
3. A vertical section of the whole machine perpendicular to the axis of the cylinder.

Section III.

1. Show by a section the double action pump and valves for a common air-pump.
2. Draw the plan and section of a stage for a microscope, with slow motion adjustments in two directions; the slips to hold down the object-slides to be shown.
3. Draw the plan and section of the compass, and box hung in gimbals, in a binnacle. (The "compass" on the card need not be drawn.)

Section IV.

1. Show in skeleton outline, in three of its positions the grasshopper parallel motion for a marine-engine.
2. Draw to its full size the eight-sided nut with its washers and part of the bolt, for bolting down the cap on the brasses of the paddle-axle of a highly finished marine-engine of 400 horse-power.
3. Show by a plan and section the solid conical axle, with its socket, collars, flanges, etc., on which a 30 feet turntable moves. Scale, $\frac{1}{4}$.

Section V.

1. Show the arrangement for reversing the motion of the table of a planing machine or printing press.
2. Show by a plan and elevation, or section, the slide-rest of a lathe for heavy work.
3. Show by an elevation the strike work of an eight-day clock.

Subject I. *Geometrical Drawing.*—Subdivision II. *Mechanical and Machine Drawing.*

MECHANICAL AND MACHINE DRAWING.

Subjects of pencil outline drawings of which two only are to be made by any one candidate.

1. Show some combination of levers by means of which an enormous pressure can be suddenly applied at one point resulting from a moderate force applied at another.
 2. A, B, C, representing equal circular disks, show how C can be made to perform 100, and B 10 revolutions, while A makes 1.
 3. Show how the action of a clock-weight on the train may be maintained while it is being wound up.
 4. Show how two pieces can be so attached that a thin blade may pass entirely through their junction without separating them.
 5. Show how the motion of a locomotive is reversed by means of two eccentrics on the axle of the driving wheel, the eccentrics being connected with the ends of a curved bar grooved.
 6. Show some combination for producing a very perceptible motion from an imperceptible one, as, for example, in the aneroid barometer or in Daniell's pyrometer.
- Whatever detail is shown in these figures must be drawn in a workmanlike manner.

Subject I. *Geometrical Drawing.*—Subdivision III. *Building Construction.*

BUILDING CONSTRUCTION.

Half the ground plan of a double cottage for two families is given; the two cottages to be precisely alike. The building to be two stories high, the front upper room to be divided into two by a deal framed partition, each room to have a separate entrance, and small sash window, and a small fireplace in two upper rooms.

The ground floor to be 9½ feet high in the clear, floored on joists, 6 feet by 2½ feet resting on dwarf walls, the earth to be dug out 2 feet below the under side of the floor, and to be kept dry by open gratings. The walls to be two bricks at foundations, and carried 1 foot below the lowest part of excavated ground, the level of the floor being 15 inches above the external ground.

The walls to be one brick thick above the lower story, carried to the height of 4 feet above the level of upper flooring boards, which are to be on joists 9 feet by 3 feet. The roof to be a simple A; tiled, rafters 6 feet by 2 feet, 18 inches apart with tie-beam, but no king-post; strong angle-ties at hips, tiles on battens, all the dwelling rooms to be ceiled, lean-to at back paved with Yorkshire stone, level of pavement 6 inches above ground laid on dry brick rubbish, a small copper and sink, window over door.

The drawings specified in Section I. and Section II. are to be made all to the same scale as that of plan. Every drawing to be correct in details and tinted to show the materials, but no candidate to make more than three drawings from these sections, selected at his own pleasure, and only five altogether.

Section I.

1. A front elevation of both cottages.
2. A plan of the upper story.
3. A cross section on AB (of one cottage only).

Section II.

1. A plan of the roof, to show that over the stairs and the mode of getting entrances to the upper rooms from the landing place.
2. A section on the line CD.
3. A sectional-elevation on EF

Section III.

1. Give a design for the truss for a roof of 60 feet clear span, rise 20 feet, tie-beam scarfed, a gallery down the middle 15 feet broad and 9 feet high, the flooring boards laid on bridging joists carried by the tie-beams, gallery lighted by dormer windows, roof slated on boards with felt covering between, gutters and parapet. Scale, $\frac{1}{108}$.
2. An isometrical projection of the connexion of the queen-posts, tie-beams, braces, &c.; the double queen-posts and tie-beams halved together with the braces between; showing the iron ties, stirrups, straps, &c. Scale, $\frac{1}{36}$.
3. The scarfing of the tie-beam shown by plan and elevation, or by one isometrical figure. Scale, $\frac{1}{12}$.

Section IV.

1. Give a plan of a circular angle-turret 7 feet internal diameter with stone walls in segments 10 inches, 8 inches, and 6 inches thick. An external gallery 18 inches wide, with parapet wall 4 inches thick, and 4 feet high; floor of the whole 5-inch stone slab in pieces not less than 20 feet area each, dovetailed together; a small stove, two doors and two windows; the whole carried on stone corbels on a corner wall 3 feet thick. Scale, $\frac{1}{24}$.
2. A section to show the corbels and their jointing and cutting through the door, fireplace, or window. Scale, $\frac{1}{24}$.
3. A drawing of the timbers of the conical roof, with projecting eaves over gallery, roof leaded on boards.

Subject I. *Geometrical Drawing.*—Subdivision III. *Building Construction.*

BUILDING CONSTRUCTION.

Questions to be answered in writing, and subjects for outline drawings in pencil by the candidates for certificates in Building Construction.

N.B.—No candidate to answer more than four questions in writing, nor to make more than four drawings or sketches in illustration of, or in addition to, those answers.

1. State what, in your opinion, was the reason for making the brick in the proportion of 1 : 2 : 4; and why was it not made twice or more as large as it is made?
2. Give a sketch, to scale, of the bond at the angles of walls of 1, 1½, 2, 2½, bricks thick, respectively.
3. Why is an inverted arch turned under the openings in all large buildings?
4. Give a design for a cornice to a building made of common bricks and tiles.
5. State the constituent materials and their proportions of good mortar, and why are road scrapings with all its impurities allowed instead of clean pit or river sand, formerly insisted on in contracts, and why was sea sand prohibited?
6. Give a drawing to scale, of one course of the solid masonry of a lighthouse of 25 feet diameter, built on a rock, and exposed to heavy seas and gales.
7. State how you would secure the foundations of a lofty building erected on a clay soil with a dip stratification.
8. Make a section, to scale, of a brick drain 3ft. wide and 5ft. high, and show the fall you think it ought to have.
9. State the reason for mortising the bridging joists into the sides of the girder in floors instead of notching them down on the top.
10. Make a section, to scale ($\frac{1}{32}$), of the timbers of a floor of 35ft. span.
11. State your opinion of the best mode of strengthening a girder 40ft. long and 12 in. + 11 in.
12. Give a drawing, to scale, of a sash frame with boxings and shutters, linings and architrave, for a good house.

INDIAN RAILWAYS.

THE *Engineer* reports that, at the meeting of the proprietors of the Bombay, Baroda, and Central India Railway, the Chairman remarked that, owing to the excellence of their gradients, they had conveyed large numbers of passengers over the portion of line completed in trains of seventy-four carriages, forty-nine carriages, and forty carriages respectively, each drawn by one engine. The construction of the iron bridges on their line had been looked upon as experimental to some extent, but it now appeared that they were a perfect success. The great work of the line—the Nerbudda bridge—had been completed and opened in May last. It consisted of sixty spans of 60 feet each, and was 70 feet above the bed of the river. During the monsoon the floods in the river rose 55 feet, and had a velocity of ten miles an hour. Owing to the alluvial nature of the soil it would have been scarcely possible to have built piers of masonry in such a position, but the screw-pile system of forming them, adopted by their consulting engineer, had answered admirably. They had also been successful in the easy gradients of their line, for they had conveyed 4,000 persons in a train weighing 720 tons, drawn by only one engine, on the occasion of the Hindoo holidays, but he would ask Colonel Kennedy, their consulting engineer, to explain that to them.

Colonel Kennedy, the consulting engineer, said, when he first proposed his plan for overcoming the difficulties of crossing the great rivers it was considered in the light of a hazardous experiment, but the plan was founded on the most careful analysis he could make. He knew that some special and extraordinary means must be taken in order to carry out the project. It was thought absolutely impossible to construct a railway in that direction, and he believed it would have been impossible by the ordinary means. The other object he had in view was to reduce the dead weight of their trains as much as possible by getting the most favorable gradients. It was rather difficult to avoid having similar gradients to those in England, but they did avoid them. The steeper the gradients on a line the shorter would be the train to ascend them, and the less effective would be their engine power. He then pointed to a diagram in the room showing that a passenger train six times the average length of passenger trains on English lines had been drawn at twenty miles an hour over their line by one engine, which showed the advantage of their level line. He could have easily found gradients of 1 in 100 on their line, and had some difficulty in avoiding

ORIEL WINDOW AT NUREMBURG.

them. The steep gradients on English lines not only limited the load, but materially added to the working expenses.

With regard to the train that had passed over their line, they would perceive that instead of having six engines and tenders to convey it in separate trains, they on their line only required one engine and tender to propel it, weighing probably 45 tons, and thus saving the dead weight of the other five engines and tenders, making together 225 tons. This was a most important matter in the cost of engines and in working the traffic on the railway.

They had to provide chiefly for third-class passengers in India. The proportion was about one first-class passenger to four second-class passengers, and 245 third-class passengers, so that in one of their long trains they had to provide for 12 first-class, 51 second-class, and 3,136 third-class passengers. They had some third-class carriages constructed in two stories, so that every one of those double carriages would hold 100 third-class passengers instead of 50. They would thus get rid of a considerable amount of dead weight, and reduce the proportion of working expenses to receipts. Their line was the most difficult to construct of any railway in India, and he believed its cost would not exceed £10,000 per mile, or £3,130,000; but if it had been constructed in the usual way they must have added £3,000,000 to its cost, and, with the usual gradients, 150 more locomotive engines and tenders would have to be provided at a cost of £450,000.

The third-class fares were one-fourth of those in England, the second-class fares were between one-third and one-fourth, and the first-class fares were one-half those charged in England. He thought that if they got 10 per cent. on their outlay with such fares they ought to be satisfied.

MEMORIALS

The Prince Consort and the Great Exhibition of 1851.—At a special meeting of the Committee appointed to erect a memorial of the Great Exhibition of 1851, held on Thursday, a communication was read from the Prince of Wales. This communication is, we believe, the first public letter written by his Royal Highness, and it will be read with the deepest sympathy. Our readers are aware that the first suggestion of a memorial of the Great Exhibition of 1851 was closely coupled with the name of the departed Prince. Most of the money for it was subscribed under the impression that the memorial would comprise a statue of the founder of the Great Exhibition. That idea was abandoned out of deference to the Prince. "Men," he said, "should not have statues raised to them while they are living." A statue of the Queen was consequently substituted; and the memorial has been brought by Mr. Durham to the verge of completeness on that understanding, and the principal figures are at this moment being cast in bronze at Birmingham. But the Prince's death has changed the situation. That attempt to do him honor which, living, he rejected, others, in their grief and admiration, have a right to renew. The desire of her Majesty and the Prince of Wales—and, we may add with certainty, that of the whole country—is expressed in his Royal Highness's communication:—

GENTLEMEN,—Prostrated with overwhelming grief, and able, at present, to turn her thoughts but to one object, the Queen, my mother, has constantly in her mind the anxious desire of doing honor to the memory of him whose great and glorious character the whole nation in its sorrow so justly appreciates. Actuated by this constantly-recurring wish the Queen has commanded me to recall to your recollection that her Majesty had been pleased to assent to a proposal to place a statue of herself upon the memorial of the Great Exhibition of 1851, which it was intended to erect in the New Horticultural Gardens. The characteristic modesty and self-denial of my deeply-lamented and beloved father had induced him to interpose to prevent his own statue from filling that position, which properly belonged to it, upon a memorial to that great undertaking which sprang from the thought of his enlightened mind, and was carried through, to a termination of unexampled success, by his unceasing superintendence. It would, however, now, her Majesty directs me to say, be most hurtful to her feelings were any other statue to surmount this memorial but that of the great good Prince, my dearly beloved father, to whose honor it is, in reality, raised. The Queen, therefore, would anxiously desire that, instead of her statue, that of her beloved husband should stand upon the memorial. Anxious, however humbly, to testify my respectful and heartfelt affection for the best of fathers, and the gratitude and devotion of my sorrowing heart, I have sought, and have, with thankfulness obtained, the permission of the Queen, my mother, to offer the feeble tribute of the admiration and love of a bereaved son, by presenting the statue thus proposed to be placed in the Gardens under your management.

(Signed) "ALBERT EDWARD."

The Memorial Committee, together with the Committee of the Horticultural Society (to whom a similar letter was addressed), unanimously agreed to carry out the wishes of her Majesty. As the memorial, designed by Mr. Durham, was completed under the superintendence of a committee, it was thought best for the sculptor and for the public that the alterations in it should also be made under the guarantee of a committee. Messrs. Foley, Marochetti, Westmacott, Smirke, Godwin, and General Grey were nominated a committee to confer on this subject with Mr. Durham.—*Atheneum*.

Memorials to the late Prince Consort.—A subscription was commenced on Monday evening amongst the inhabitants of Newport, Isle of Wight, for the purpose of defraying the expense of erecting, in St. Thomas's Church, a monumental tablet, or placing there a memorial window of stained glass, as the subscribers shall determine, to the memory of his Royal Highness the late Prince Consort, who assisted to raise the sacred edifice, both by his influence and his purse.—At Salford, a subscription is on foot to erect a memorial statue to the late Prince Consort. There is a statue of her Majesty in Peel-park, and it is now proposed to erect a companion statue to the Prince near it.—London and Manchester are making a move in the same direction.

The Stephenson Memorial.—Great progress has been made with the Stephenson memorial about to be erected in Newcastle. Four of the statues are already cast in bronze, and in the hands of the chaser; the fifth will shortly be out of the mould. The whole monument will be of that lasting character which alone is worthy of George Stephenson, the town, and the sculptor. Arrangement has been made to execute the pedestal for the reception of the five colossal bronze statues, in the most durable manner, and according to a specification supplied by the local committee. The stones for the pedestal have been for some time past in course of selection from the quarry chosen by that committee; but their large dimensions preclude their being collected from this one quarry other than gradually. The site affords space and area for the composition to detach itself, as a whole, from contiguous objects.

Monument to Sir Humphrey Davy, at Penzance.—The committee of working men, which has recently been formed for the purpose of erecting a

monument at Penzance to Sir Humphrey Davy, have received designs from architects, of which those by Messrs. Salter and Perrow have been selected. These designs are two in number: a monumental column surmounted by a bronze statue 10 feet high; and a monumental tower, with an internal staircase, and surmounted by the same figure—the height of the monument, from the base to the summit, to be 120 feet in either case. The column has a square solid block for its base; on this base rests a fluted portion of the pillar, some 20 feet long; on this rises a simple column, relieved by polished granite bands, some 40 feet higher, surmounted by a capital; on this rises a super-base, on which the figure of Sir Humphrey Davy is fixed, with the safety-lamp in his right hand. Engravings at the base are to have suitable inscriptions, heraldic devices, &c., engraved upon them; also the Davy lamp, the Leyden jar, a gas receiver, and a galvanic battery are to be placed on the top of four pedestals at the base of the column. The tower proposed is square in plan, resting on a Gothic base, with the Davy arms cut in relief over the doorway, which leads to the top of the tower by a spiral staircase. Under the super-base, on which the figure rests, is an outside gallery accessible by the staircase, and immediately under the gallery is a landing with a three-light window, and tracery on each side. The monument is proposed to be placed on Lesendjaek-hill, and it is said that the summit will be higher than the top of St. Michael's Mount. The estimated cost of the monument is £2,500, and if the tower be chosen in preference to the column, some £500 more will be required.

Artillery Memorial, Woolwich.—Mr. John Bell has completed the colossal figure of "Honor" for the Artillery Memorial at Woolwich, it is erected on the parade in front of the barracks. The pedestal is decorated with four bronze shields or escutcheons, the casting being of metal from Russian guns. The statue erected in memory of those of the regiment who fell in the Russian war, will not be unveiled until a plan for the ornamental laying out of the space in front of the barracks, including a grand approach, has been determined on. We may note here that by the same sculptor, and among the contributions of the Coalbrookdale Company to the Great Exhibition, will be a bronze female statue of the "Oetoroon," also a bronze statue of "Temperantia," placed under an ornamental open-work metal canopy, covering a polished granite drinking fountain. These statues are both life size.

Herbert Memorial.—Baron Marochetti has met the sub-committee of the subscribers at Salisbury, and selected as the site of the statue of the late Lord Herbert the spot on which the Russian cannon is now placed, in front of the Council-house, provided the corporation will grant the same. The statue, which is to be of bronze, will be 8 feet in height, and will be placed on a pedestal of polished Aberdeen granite.

ARCHITECTURAL ASSOCIATION.

AN Ordinary General meeting of the Architectural Association was held on Friday, at the Rooms, 9, Conduit-street, Regent-street; Mr. PARAIRE in the chair.

Mr. ARTHUR SMITH, Hon. Sec., read the minutes of proceedings at the last meeting, which were approved of and confirmed.

The Library Committee.—Mr. A. SMITH stated that the Committee of the Association had had under consideration the report of the Library Sub-Committee (a copy of which appeared in our impression of the 27th ult.), and had come to the following resolution:—That the report of the Sub-Committee be received and adopted, and the curators be empowered to carry out the same, subject to the following amendment:—That it is not thought expedient at present to withdraw as much as £10 from the funds of the Association, but that half of the amount should be provided out of the funds, and the remaining half be raised by voluntary subscriptions amongst the members.

Mr. SMITH moved the adoption of the report.

Mr. PARAIRE seconded the motion, which was unanimously agreed to.

New Members.—The following gentlemen having been balloted for, were duly elected members of the Association:—Mr. George Twigg Molecey, 20, High-street, Eccleston-square; Mr. Ernest Turner, 33, Bermondsey-square; Mr. Frederick Brooks, 9, Grafton-place, Euston-square; Mr. Edward Lyman, 25, Koppel-street; Mr. Alfred J. Little, 34, Eagle-street, Red Lion-square.

A Few Days at Chartres and other French Towns.—The discussion on Mr. Blashill's paper, "A Few Days at Chartres and other French Towns" (which has been published in the BUILDING NEWS), was resumed by Mr. PARAIRE, who made a number of diagrams on the black-board, referring to peculiarities in French buildings referred to by Mr. Blashill in his paper, and showing the differences of method followed by our Gallie neighbors as compared with the practices adopted in this country.

Mr. Paraire was followed by Mr. BLASHILL, Mr. SPIERS, Mr. NEW, and Mr. C. H. F. LEWES, and others, all of whom applied themselves with vigor to the use of chalk and the black-board.

At the close of the discussion a vote of thanks to Mr. Blashill was carried by acclamation.

The Exhibition of 1862.—The Hon. Sec., Mr. ARTHUR SMITH, announced that he had received a letter from the Sub-Committee of the Fine Arts Department of the International Exhibition of 1862, setting forth the regulations under which they would be prepared to receive such works of art, models, &c., as might be presented to them for inspection, the same to be forwarded to the South Kensington Museum, and, in case of being accepted, the works to be delivered at the Exhibition building not later than the 30th of March.

Shortly afterwards the meeting separated.

THE HORTICULTURAL GARDENS.

SIR C. P. PHIPPS, by command of her Majesty, has written the following letter to the Horticultural Society:—

The Queen has directed me to inform you that it is her Majesty's wish that the Horticultural Gardens should be considered as under her peculiar and personal patronage and protection. The only consolation that her Majesty can hope to find for the rest of her life, under her bitter and hopeless bereavement, is to endeavour to carry out the wishes and intentions of her beloved husband. The Queen well knows the deep interest that he took in this undertaking, and would wish to have periodical reports sent to her Majesty of the progress and proceedings of the Society.

Sincerely yours,

C. D. PHIPPS.

ON THE CONSERVATION OF ANCIENT ARCHITECTURAL MONUMENTS AND REMAINS.*

IT may, perhaps, appear that I should offer some apology for occupying your attention this evening with a subject at once so trite and so uninviting as that which I have chosen as the title of this paper. If so, I would say in reply that it was intended for our opening meeting, and that those meetings seem to me to demand, as the leading subjects to be discussed at them, matters of vital importance to our art, rather than of an amusing or highly interesting character, and that I hold the subject I have chosen to be, however trite, one of the most pressing importance.

I assume as my starting-point that every member of this Institute appreciates the immense value, to any country which possesses a history and a civilisation, of the monuments and remains by which that history and civilisation are illustrated.

The value of such monuments of the past is great enhanced when they illustrate the rise and development of a special style of art; still more so, when that style of art is one of great and acknowledged merit, and yet more than all when it is one which has proved worthy of revival and re-development.

Those among us whose taste and education have led them to a more especial appreciation of the art of the ancient world, will feel how strongly these remarks apply to the precious monuments and relics of Greece and Rome, and of the countries over which their arts and influence extended. These illustrate a history and a civilisation the most wonderful in its character; they illustrate also the development of a style of art, the merits of which no one has ever presumed to question, and which has been revived and re-developed in more recent ages; and, as a natural consequence, every relic of these arts, however fragmentary or obscure, is searched out, delineated, and, when possible, protected and preserved with an amount of zeal and assiduity proportioned to their importance, and which does honor to that modern civilisation which so keenly appreciates and rejoices in that of the past.

Should not, however, the same feelings and the same care, zeal, and assiduity, be extended to the monuments of our own race and our own country? Have we not a history as glorious and, to us, at least, as interesting as that of the great nations of antiquity? Have we not a civilisation as noble as theirs?—and should not the monuments which illustrate that history and civilisation be as precious in our eyes as those of Greece or Rome?

Added, however, to the value which these remains ought to possess in our eyes as Englishmen; they possess *intrinsic* claims parallel to those of the works of the great nations of antiquity. They illustrate the development (and especially our own share in it) of a style of architecture as marked in its character as theirs, and the merits of which, though long neglected, are now appreciated and acknowledged by most of us, and have, just as in the case of the Classic styles, led to its revival and re-development.

Let it be clearly understood that I am entering upon no controverted questions: I am instituting no comparison between the intrinsic merits of the two phases of art, nor asking any assent to more than the *fact* of their revival. On all such questions we may hold our individual opinions, and yet may all agree to what I wish to lay down as the groundwork of what I desire to say this evening, that our architectural monuments possess claims upon our care and conservation precisely parallel in their nature to that which we accord to those of classic antiquity, but with these two preponderating points in their favor—that they are our own monuments, and that we are the parties responsible for their conservation.

I would next bring under your consideration the melancholy fact that, though our country is studded with these relics of the past, they are every year being reduced in number, and that those which remain are constantly subjected to the danger of destruction or deterioration from many different causes, among the chief of which I may enumerate—

I. Natural decay and dilapidation, which are greatly enhanced by the destructive climate to which they are exposed, and still more by neglect.

II. Wilful destruction and ruthless mutilation, together with alterations suggested by the passing requirements of the day or by individual caprice.

III. The yet more destructive inroads of *over restoration*.

These three causes, or classes of causes, threaten, in a degree so imminent and so alarming, the existence, the integrity, and the authenticity of our ancient architectural remains, that I feel it to be high time that this Institute, together with all local architectural and antiquarian societies, should take it into their serious consideration, both severally and jointly, what measures can be adopted to arrest the evil before it be too late.

Our ancient architectural remains may, for the most part, be classified under the following heads:—

I. Mere antiquities, such as Stonehenge, the Cromlechs, and many of the remnants of Roman structures, though the latter often contain objects of art, as mosaics, pavements, &c.

II. Ruined buildings, whether ecclesiastical or secular, such as abbeys, castles, &c., &c.

III. Buildings still in use, as churches, houses, inhabited castles, &c.

IV. Fragmentary remains embodied in more modern buildings, such as those which usually exist within the precincts of cathedrals, and often in old houses and country mansions, to which class may be added a vast amount of interesting and valuable fragments, mainly of domestic architecture, and often, though of a simple and even rustic character, of great practical importance to the student of our old architecture, to be found among our country villages, and in the scattered houses of the farmers and the peasantry, as well as other miscellaneous remains.

On the first of these classes, that of a purely antiquarian character, I will not trouble you with any remarks, as I think that our antiquaries are sufficiently alive to their value, and exercise a wholesome vigilance in respect of them. It is not in general this class of ancient remains which is most in danger, though it behoves every one who has it in his power to do his very utmost for their preservation.

The second class, however—that of ruined structures—is one which demands much and careful consideration, and it is one towards which the salutary vigilance of our Institute and of kindred societies might, with great advantage, be directed.

The very condition of a ruin, of necessity involves liability to rapidly increase—

ing decay and the probability of speedy destruction; and it so happens that two great events in our history, the dissolution of monasteries in the sixteenth century and the dismantlement of castles in the seventeenth century, have reduced two important classes of architectural edifices to this hopeless condition.

As regards ruined castles, it fortunately happens that the massiveness of their construction enables them, in many instances, to offer a fair amount of resistance to the elements, and that the simplicity of their architecture causes them to lose less from mere decay than structures of a more decorative kind. Such is not, however, always the case, and I would most strongly press upon those who have the charge of these stern historical relics to guard them against the effects of time and mutilation, and upon antiquaries and antiquarian societies to make periodical examinations into their condition, and to advise their proprietors as to such timely works of repair and sustentation as may arrest the hand of time without tampering with their antiquity; and if their natural guardians refuse the necessary protection, to raise funds by private subscription for the purpose.

When we come, however, to ecclesiastical ruins, the case becomes infinitely more pressing. Unlike the great works of defence just alluded to, these edifices were not erected with a view to resisting any but the ordinary causes of destruction to which buildings are subjected. Their structure is comparatively light, and in principle trusts for stability to the nice equipoise of arches and abutments, and pre-supposes the protection of a roof. It is, therefore, a matter for wonder that after more than three centuries of exposure, unroofed, and uncared for, and though often used to supply materials for surrounding buildings, their ruined forms should in so many instances have reached our time in a condition, which enables us in any degree to appreciate their merits or their design.

Happily, however, though great numbers of them have ceased to exist, very many precious remains are left to us, and these, instead of being like those of castles, stern and almost forbidding in their undecorated grandeur, are for the most part, exquisite and highly finished architectural productions, equally valuable and equally beautiful with our glorious cathedrals; and in their own phase of art as classic and as perfect as the remains of antique art which we so much cherish.

Now, the two points to be considered are, 1st, can we expect these precious fragments to endure much longer; and if not, what can we do to promote and prolong the continuance of their preservation?

On the first question I fear that the reply cannot be very satisfactory. Those who have for any considerable course of years been in the habit of revisiting any particular ruin, can scarcely fail to have observed how sensibly and how surely the course of decay, disintegration, and downfall has progressed, even where there has been no deliberate mutilation.

The decay of the surfaces seems to have of late years, redoubled its speed. I have revisited buildings, and particularly ruined buildings, where 20 years earlier I had been able to make minute sketches of delicate carved work, and found the carving now become unintelligible. In many of the best preserved ruins we find the surfaces of the mouldings and carving covered with an ever-fresh pulverescence. If you visit a building in this exposed condition after a hard winter, you are sure to find fresh spots where the details have fallen off through the recent frost, and in every ruin there occur, from time to time, slips and downfalls of greater or less importance, showing that, long as they have resisted the assaults of time and weather, there are limits to their duration, and that those limits are by no means distant.

How many of our ruined buildings have lost large portions within the memory of man! The Abbey of St. Augustine at Canterbury has lost its great tower within no very distant period, and I myself remember the newspaper notice of the fall of the central tower of Whithy Abbey carrying away with it large portions of the surrounding building; indeed such downfalls, if their statistics could be collected, would be found to reach an alarming number and amount, while the silent and yet more fatal progress of decay, is every day and every hour eating into the most beautiful and most precious architectural details.

And how could it be otherwise, when walls constructed of small stone and rubble work are exposed, with no protection but ivy and wall-plants, to the constant action of the most destructive of climates; when every shower penetrates the crumbling mass, and every frost has its full swing in its disintegration, and even the more solid stone, from being kept in a constant state of saturation with water, has every cause of destruction in full and continued operation upon it,—and all this for centuries together?

Nor have these been the sole agents of destruction. Many, indeed the great majority, of our noblest abbey churches, and even some cathedrals, have been taken down for the value of their materials, and those which were left as ruins were, for the most part, spared more because there was no market for their material than for any care for their preservation; and it naturally follows that they would become the quarries which would supply all the petty buildings around them.

Perhaps the most remarkable case of this is at Reading, where the walls of the abbey have been stripped of their ashlar, both without and within, and the rubble core only left; yet such is its extraordinary strength that it still holds together in perfectly solid and compact masses; and where fragments of the tower long since fell they remain to this day, protruding from the ground at the same angle at which they first reached it, and look like masses of rock cropping out of the earth.

This has been continued in many instances up to our own day, and even now it is occasionally found in a certain degree to hold good, as at Easby Abbey, in Yorkshire, where the lower part of the buttresses appear to have been comparatively recently pulled down, as being the parts most easily got at, while the upper stages, being out of reach, are left unsupported and dragging over the walls which they were built to stay.

For the most part, however, it is neglect and the want of timely care which we have now most to complain of. I heard the other day of a considerable portion of a ruined abbey in Norfolk falling down, and this on the property of a great lord, who, I am sure, would have taken proper precautions had his attention been called to it by anyone qualified to give an opinion. The proprietors of these melancholy, yet glorious, remains, though valuing and caring for them as picturesque ruins, frequently seem to forget their value as works of art, and to prefer risking their falling to pieces bit by bit to the trifling interference with their picturesque effect, which would be incurred by a little timely reparation.

Now, what I wish to bring before you as the practical result of what I have been saying, is the absolute necessity for such reparations if we desire to hand down these precious architectural relics to our successors. In defining what the nature of such reparations should be one may use the words of Mr. Ruskin:—

* A paper read by G. G. SCOTT, Esq., before the Royal Institute of British Architects.

* Take proper care of your monuments, and you will not need to restore them. *
 Watch an old building with an anxious care; guard it as best you may, and at any cost, from the influence of dilapidation. Count its stones as you would jewels of a crown; set watches about it as if at the gates of a besieged city; bind it together with iron where it loosens; stay it with timber where it declines; do not care about the unsightliness of the aid; better a crutch than a lost limb; and do this tenderly, and reverently, and continually, and many a generation will still be born and pass away beneath its shadow. Its evil day must come at last; but let it come decidedly and openly, and let no dishonoring and false substitute deprive it of the funeral offices of memory.

The first objects of such reparation are—protection against the penetration of water into the walls; support, to prevent downfall, from the failure of foundations, abutments, or the sustaining work, whatever it may be; and, lastly (if such a thing be found to be practicable), the preservation of the architectural details by some indurating process which will arrest their decay.

None of these need, if judiciously carried out, materially or permanently affect the picturesqueness of the ruin; and I need hardly say that they must be so done as in no degree at all to infringe upon the authenticity and genuineness of the work. The case is wholly different from *restoration*—*protection* and *preservation* being the sole objects.

It would, however, be dangerous even for such works as these to be carried out by ignorant persons. They demand the careful vigilance of the antiquary and the architect to see that the value of the remains is not injured.

It seems to me that there ought to be a kind of *Vigilance Committee* appointed for every district by our Institute, in conjunction with antiquarian societies, whether general or local; that these committees should not only themselves take every opportunity, whether collectively or by their individual members, of inspecting every architectural ruin within their district, but should take public measures for inviting information and suggestions respecting them; that they should, from time to time, report to the proprietors of such remains, and suggest what reparation is needed; and that they should take measures for obtaining funds for them when they find that such aid is necessary. They should also obtain permission to direct what is to be done, and to have a veto upon anything which would be injurious.

For protection against the admission of wet from the top of the walls, much could be done by coating them roughly on the parts invisible from below with a concrete of cement and fine gravel; by re-setting loose stones in cement, by filling in with the same material cavities and open joints, cracks, &c., always taking care, so far as possible, to do this in a manner little, if at all, visible from below. In extreme cases, where arches threaten ruin, it may be desirable to go the length of erecting centres below, and rectifying them, and filling in the joints with cement.

When any large mass of a wall threatens to fall, shores should be applied, the foundations examined, and strengthened if necessary, loose stones keyed in, open joints filled, and, in very bad cases, bonded; but this should be done under the eye of a person who has a feeling for the work, both on its own account and as a picturesque object, so as to avoid any unsightly tampering with the old work. The only cases where such is necessary seem those in which the shattered piers or walls are insufficient for the weight they have to bear; in such cases they must be underbuilt, buttressed, or propped, in some way. Here it will be better to make the new work rough, and of old materials, but in no degree to mask it, but rather to make it manifest that it is only added to sustain the original structure.

It is clear that in such cases it will be best to call in an architect, provided he is one who has an earnest care for the conservation of the work, and a full appreciation of the value of its authenticity.

I may here mention that the west front of Crowland Abbey, which threatened immediate fall, has been of late rendered, as I hope, permanently secure by means of repairs such as those above suggested, carried out under the influence of the Lincolnshire Architectural Society.

The importance of applying to the finer details a preservative and indurating solution, if such is to be found, is almost as great as that of the upholding of the masses; the pulverisation of the surface seems in many cases to be going on at a constantly accelerating pace, and threatens the speedy loss of the true forms of the mouldings and the sculpture. At Fountain's Abbey—perhaps the best cared for of all these remains—I have observed the constant degradation of the mouldings from this cause; if we could save them by such a process, it would be worth anything.

In the interior of Westminster Abbey I am gradually indurating the mouldering stone in its present state, and securing it (as I hope) from further decay, and it is not unreasonable to hope that a process will be found which will do the same for external work.

Besides, however, doing what is possible for the conservation of these invaluable remains, we ought also to see that there is no part of them which has not been thoroughly and carefully represented and measured.

I think a society ought to be formed, or a united effort made by different existing societies for the perfect delineation of our ruined buildings. A good deal has been done by Mr. Sharpe, Mr. Potter, and a few others, but the thing has never systematically been taken in hand.

Now that we understand and appreciate the value of the remains of our ancient architecture, it is a standing disgrace to us that we allow them to remain without perfect and authentic illustrations being made of the whole and of every detail, and where it can be done without disfigurement and without endangering the tender and pulverising surface, casts should be taken of every carved and sculptured portion, which should be deposited in some permanent national collection, with a full description of the parts to which it belongs.

Photography may also be most usefully brought to bear upon the subject, but must not be implicitly trusted to, on account of the uncertainty of its duration; but, whatever the modes adopted, it will be monstrous if we allow the most valuable of our ancient architectural remains to become disintegrated and their exquisite details lost without having placed upon record perfect and absolutely authentic representations of every portion of them.

Let us prolong their existence to the utmost limit, but at the same time provide against their dissolution by perpetuating their designs in some form which will exist after the glorious originals have passed away or become unintelligible from decay.

I now come to the third class of ancient remains—buildings still in use.

Here we come at once within the regions of controversy, of animadversion, and regret; for here we have united in one all the causes of destruction and deterioration—natural decay, neglect, wilful destruction and mutilation, and the now so prevalent operation of *over restoration*.

I must beg, before I proceed, that it may be clearly understood, that, in any criticisms I may express on the course followed by others, I do not wish or expect to exempt myself from equal blame where I deserve it. *We are all of us offenders in this matter*; and to abstain from speaking plainly lest we should be ourselves blamed, will be a course at once cowardly, and treasonable against those principles which one every day more strongly sees to be right, however conscious one is of continual departure from them.

In speaking of ruined buildings, I have fully and cordially adopted Mr. Ruskin's principle of mere *sustentation*. For such remains it is clearly right. This, however, cannot be strictly acted upon in dealing with churches and other buildings still in use.

Viewing them solely as original architectural remains, one would desire, were it possible, that the same abstinence from all but mere upholding should be applied to them; but, in the first place, it is clearly wrong to treat the houses of God as mere architectural specimens to be stereotyped in their present state of mutilation and decay for our study and instruction; nor, if it could be proved right, would it be possible to convince their guardians that such a course should be followed; nor in the case of houses and other secular buildings, to induce people to inhabit and make use of ruins to gratify our sentiments towards them.

It may, then, be laid down as an absolute certainty that buildings whose use is continued must be kept in or put into a seemly state of reparation; and it is, therefore, both our duty and our interest, instead of opposing what cannot be prevented, to do our best to lay down laws for ourselves, and suggest them to others as guides in carrying out the works which of necessity must be done.

The great principle to start upon is to preserve the greatest possible amount of ancient work intact; never to renew a feature without necessity, but to preserve everything which is not so decayed as to destroy its value as an exponent of the original design; never to add new work except in strict conformity with the evidences of its original form; never to mask over or smarten up old work for the sake of making it conformable with new, never to "restore" carved work or sculpture, but leave them to speak for themselves; and, generally, to deal with an ancient work as with an object on which we set the greatest value, and the integrity and authenticity of which are matters which we view as of paramount importance.

These principles are, however, much more readily laid down than acted upon; so much so, that to one who holds them the process of restoration is one of continual disappointment, vexation, and regret; for, labor as you will to act up to first principles, innumerable hindrances stand in the way of their realisation.

Sometimes the stone is found to be so utterly disintegrated that it is with the utmost difficulty—here a bit and there a bit—that you can trace out by laborious study what were the original details; and to attempt to keep these bits seems as hopeless as to preserve a body which falls to dust as you look at it.

Sometimes, when this is by no means the case, a barbaric builder, or clerk of works, or an over-zealous clergyman interferes in your absence, and destroys the very objects you have been most laboring to preserve.

A conscientious representative having been blamed for incurring extras in one place, makes up for it in another by introducing, before one is aware of it, a sweeping clause, which condemns quantities of work one meant most religiously to preserve; and, from one cause or another, one is always finding one's intentions more or less frustrated.

Still, however, this is better than acting on no principle at all, or rather, as is too often the case, acting on the principle of preserving as little as possible, and renewing as much as possible.

To labor hard for the right principle, with whatever amount of shortcomings, must be better than openly to advocate and act upon those which are directly wrong.

However this may be, there is no doubt of the fact that our churches and old buildings are everywhere losing their value, through misdirected and reckless, or at least *overdone* restoration; that it is high time that some public protest be made against it, and some course adopted for its prevention, and that each of us in our own practice should institute a rigorous examination as to what he has done and is doing, with a view to a stern falling back upon true principles; that the churches yet unspoiled may yet be saved.

Here again, I would suggest the Vigilance Committee already hinted at. It could do much, though the works in this case are so many and so widely spread that it seems impossible for all to be watched.

After all, then, we must look to the architects employed. If they will not labor in the right direction I fear there is but little hope, and yet, without some stern supervision, I believe that the majority of them *will not do so*; and, further, that they will always be able to adduce such plausible and practical reasons for their destructiveness, as to convince their employers that they are in the right.

I am, however, very uncertain whether we do not all go upon a very wrong principle in our dealings with ancient churches. I could almost wish the word "*restoration*" expunged from our architectural vocabulary, and that we could be content with the more common-place term "*reparation*." We have got into the way of assuming that the "*restoration*" of a church must, in its own nature, be the signal for pulling it to pieces from top to bottom. Not only must substantial repairs be attended to; the foundations underpinned, the strength of the walls looked to, decayed timbers spliced or new ones here and there inserted, the most decayed stones carefully cut out and replaced, the covering made reliable, and the fittings put in seemly order, following and retaining every remnant of what is ancient, the stonework cleaned from its thick coatings of whitewash, and the roofs divested of the concealment of modern ceilings; but, beyond all this, *everything must be modelled with*; the seating all taken up, floors removed, plastering stripped from the walls, the whole church left for some months at the mercy of the elements by the removal of its roofs, windows which do not please the clergyman or the squire replaced with more pretentious ones; indeed, the whole thing overhauled, and *radically re-formed* from top to toe.

We all of us, however conservative our views, adopt something approaching to this as the normal and necessary view of a restoration; and the chief difference between us is, that, if the architect be at heart earnestly conservative, the church comes out from the ordeal with a certain amount of its ancient self remaining, but with very much of a new garb, or very much of its ancient look, and very many of its interesting ancient features gone; but if his feelings are not conservative so much the more of novelty is there instilled, and so much the less of antiquity retained in the restored church.

Now this is really beginning to tell in a fearful manner upon the value of our ancient churches and the interest with which one visits them. One perfectly

longs after an untouched church, though one knows that the state of them is by no means such as a man of feeling can look at without shame.

Still in them are found our old churches as they have been traditionally handed down to us. True it is that the exterior is in part decayed and mutilated, and even disgraced by barbaric alterations, yet one feels that the old work which remains is genuine and untampered with. True, the interior is coated with whitewash, thickened out indefinitely by the repetitions of centuries, but beneath it we know that the old stonework is as the very workmen left it, and that if carefully scaled off with one's knife we shall find the distemper decorations of, perhaps, two or three periods in its thickness. True, the roof is decayed, patched, and, perhaps, hidden by a plaster ceiling, but we know that its timbers were wrought by the very men whose architecture we are studying, and that it is of the utmost value as an original specimen of their work. The floor, it is true, is sunken, worn, and patched with brick, but it contains the half-effaced memorials of those who lived while the church was new, and when parts of it were being built; and in certain corners remain the ancient encaustic tiles. The windows, again, are filled with patched and irregular glazing, but in the heads of the lights are remnants of the stained glass which once filled the whole. The bells are, perhaps, cracked, yet on them you will find the beautiful fretted border, and the pious, though it may be superstitious, legend.*

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting was held in the rooms, 9, Conduit-street, Regent-street, on Monday evening, when there was a very numerous attendance. The chair was occupied by the President of the Institute, WILLIAM TITE, Esq., M.P., F.R.S., &c.

Mr. LEWIS announced several donations, and a vote of thanks to the donors was passed.

The late Prince Consort.—*The Great Exhibition Building, &c.*—The CHAIRMAN said the ordinary meetings of the Institute had been interrupted by that accident which had cast gloom and universal grief throughout the country—he referred to the death of his Royal Highness the Prince Consort, who had particular claims upon them; being their patron. The Queen was originally their patroness, but a year after their marriage the Prince Consort did them the honor of becoming patron, and they were one of the, perhaps, very few societies the Prince personally visited, and on one occasion he took the chair. On that occasion, and on all other occasions on which he had met him, the Prince Consort conducted himself with that condescension, warmheartedness, and practical kindness that made him so remarkable even at that early period of his career—a native German, ignorant of our feelings, our habits, and our customs. They therefore possessed a knowledge of the qualities of the Prince Consort, and therefore he felt that the Prince was associated with the architecture of England. All topics of eulogium had been exhausted, and he did not know that he could say anything new on the subject. The Council of the Institute felt it their duty, in consequence of the Prince Consort's death, to postpone the meeting which would otherwise have been held on the 16th of December last. The Council also presented, through him, to Sir George Grey, the Home Secretary, an address of condolence for presentation to Her Majesty the Queen. The address was extremely short, and he would ask the Honorary Secretary to read it. [Mr. Lewis, Honorary Secretary, then read the address, which has already appeared in the BUILDING NEWS]. Of that address an acknowledgement, addressed to him, dated Whitehall, 4th January, and signed by Mr. Waddington, had been received, stating that Sir George Grey would take an early opportunity of laying the address before her Majesty. He would mention one incident in his own life, that brought him into particular association with the Prince Consort in connexion with science, and indirectly connected with architecture, that of chemistry. A few years ago it was thought desirable a scientific chemistry should be taught in England, and Mr. Clarke and others conceived the idea of constituting what was now in fact a college of chemistry. Through the attention of Professor Levi notice was taken of Professor Hofmann; it was through that society the services of Professor Hofmann were secured, but that result was chiefly attributable to the instrumentality of the Prince Consort. And he thought the society had thereby done the greatest possible amount of good in a manufacturing country of so much importance as England. In that matter the Prince Consort took the deepest possible interest; he gave his time, thought, money, support, and patronage in favor of that very useful institution. The institution continued for some years tolerably successful, at last the council transferred it to the Government, and now it formed a part of the great institution in Jermyn-street, which was of so much importance to the country. The part which the Prince Consort took in that great school was not generally known; it came to his knowledge, and he felt bound to state that they ought to say they owed eminent acknowledgments to the Prince Consort in that respect. Departing from that subject he came to one which he had been requested by the Council to mention. Lately at the Society of Arts a paper was read on the new Exhibition building designed by Captain Fowke. He and others had protested against the fact of an architect not being consulted on a matter of so much importance as the erection of an Exhibition building. However, there seemed to have been, at the Society of Arts, an attack made on architects, and the Council of the Institute and he himself had received letters asking them to take that matter up. Now, it was the feeling of the Council not to take any notice of that attack—(Applause). The Chairman proceeded to remark that calumny and derision were not worthy of notice, and that they were told not to meet an unwise man in his want of wisdom. Men occasionally rose up and attained eminence even without a professional education. It did not follow that because a man had got an early education addressed to a particular pursuit there was anything gained thereby. Telford was at first a humble mason, then an architect, and then an engineer. But he did not mean to say that if Telford had had a good education he would not have been as good an engineer as he was without it. These things seemed to him to be accidents and incidents showing how men could get on with the greatest trials to get over. Dr. Lee was a great Oriental scholar, though in the humblest walks of life before. An architect was an architect, an engineer was an engineer, and every one knew what it meant, and an Oriental scholar was an Oriental scholar, and everyone knew what that meant. These were reasons why they should not enter into a discussion on the subject of the Exhibition building. Though they had been offered papers about this matter, he thought the meeting

would agree with him that they ought not to take any notice of the papers. As to the ungraceful remarks which had been made elsewhere respecting Sir Charles Barry (some of whose relations he was glad to see before him), they had all to admire the great skill with which that eminent architect wielded his style of architecture, and if in some cases in a building of such enormous extent as the New Palace of Westminster he failed a little, he thought he was not entitled to be held up as the case of a distinguished failure of an architect.—(Hear, hear.) He knew of no man more deserving of their honor, more deserving of the honor of the country and of the profession to which he belonged.—(Cheers.) He thought it was an unfair thing to attack a dead man whose loss they had recently so much to deplore.—(Hear, hear.) So much for that subject. He now wanted to say a word about a memorandum that related to himself. In an artistic journal, having an extensive circulation, he found a most curious incident. They would recollect that in his introductory address at the opening of the session he took some notice of the improvements which had been going on at Paris. In the journal in question a portion of his address was given, and then followed additions which did not belong to him but which still appeared to form a portion of the address and to follow up observations previously made in it. Under the head of *Notabilia* in the journal in question appeared the following:—

“**IS PARIS IMPROVED?**—In the course of his opening address at the Royal Institute of British Architects last Monday evening, Mr. Tite, the President, said that all travellers who returned from Paris were, upon a superficial view of what was taking place there and in almost every town of France, disposed to find fault with the comparatively slow rate at which improvements were effected in London. Within ten years Paris has been, in fact, remodelled throughout, and broad streets, open squares, and fine houses had replaced the ancient, narrow, tortuous dens of filth and impurity. It was to be feared, however, that the real sanitary improvements of Paris had gained little by these changes; and, indeed, so long as the water supply and the sewerage there were conducted on the present systems, little effect could be produced on the infallible test of the value of the sanitary arrangements of a town—the average death rate. He advised those who believed that ‘they manage all these things better in France’ to visit the ‘in-take’ of the Chaillot Waterworks, which was unpleasantly near the mouth of one of the great sewers, or to ponder over the charge he would have to pay, even in a private lodging, for the necessity of an Englishman's life—the daily hip bath. Nor was this all, for the embellishments of the town had resolved themselves into heavy charges on its inhabitants, while the utility of many of the costly works now in hand seemed more than questionable. House-rents had risen to fabulous heights in Paris; the poor were driven from their old haunts, and no refuge was provided for them; while, unfortunately, the sanitary defects of the old houses were servilely reproduced in the new ones. No doubt there was something fairylike in the rapidity and the brilliance of the changes brought about, but these improvements have been effected upon principles of political economy and by an abuse of public credit which would never be tolerated in England.” Up to that point what he said at the opening of the session was very fairly reported, but then followed what was not spoken by him, but which seemed to fit the speech remarkably well and to bear out what he had said. It was,—“Go into the courts of the new houses (when they have any) and see what they are like. Count the windows which take their air and light from them; in some of the worst cases you will find eighty windows looking into a well 20 feet square and 70 feet deep. A more striking example still is furnished by the view from the tower of St. Jacques la Boucherie. At your feet run the Rue de Rivoli, east and west, and the Boulevard de Sebastopol, north and south, each some two miles long and straight on end, excepting where the latter twists across the Place du Châtelet and the Seine. Directly you look over the parapet you are struck by the extraordinary compression of the houses which form these two great streets. Almost everywhere else there is a certain little space remaining between the backs of the houses, but behind the splendid buildings which border these gigantic alleys there is no space at all. The houses are packed back to back; they seem all roof. There is only one comparison possible of the scene before you. You fancy at once that an immense plough has driven a furrow down each of the streets, turning up the houses tight against each other right and left, just like clods in an autumn field. Many of them are simple veneers, one room thick. The average surface of court-yard in the two streets is certainly not one-tenth of the whole area. How could it be otherwise? The land is worth £40 a yard! The air has been taken out of the courts and put into the street; the front rooms have more of it than they had before, but the back ones, which are by far the most numerous, have none at all. Now, as the great majority of the 12,000 new houses, and not a small proportion of the enlarged old ones, are more or less constructed on this plan, can it be denied that their inhabitants pay something more than a simple money price for the changes effected? Is the privation of air and light to be counted for nothing? The Parisians are not toads or tortoises, and cannot live without breathing or seeing. These unhealthy houses have often been attacked, but with no result; their dangers were publicly but vainly indicated in 1857 by the lectures of the Professor of Civil Construction at the Conservatoire des Arts et Métiers, but they go on growing at the rate of thousands a year. Add the certain consequences of this system of lodging to the £319,000,000, and you have the total price of the improvements of Paris.” Who was the author of the latter portion of the extract he knew not, but the incident was a curious one, and he had ventured to notice the matter, though he was not the author of the passage.

Mr. GEORGE GILBERT SCOTT, R.A., then read a long and able paper on the Conservation of Ancient Architectural Monuments and Remains. The first portion will be found elsewhere.

The CHAIRMAN said he would venture to make one or two remarks, which occurred to him in the course of the reading of the paper. Mr. Scott referred to Mr. Ruskin's opinion about the preservation of antiquities; that gentleman did more than give his opinion, he addressed the Antiquarian Society, and forwarded to it a large donation. The Antiquarian Society, on the Council of which he (the Chairman) had the honor of being, took the matter up, and issued a circular addressing the local secretary in furtherance of the object. However, they met with no encouragement on the subject, and after their best efforts were exhausted, the matter had died a natural death. He did his best to prevent that, but was unsuccessful. That being so, he was a little afraid Mr. Scott would not succeed in a more extended attempt. At the same time, he should be very happy to aid him in the attempt, because he felt, as all must feel, the importance in an artistic point of view, of the appointment of some such dominant body as that proposed. One could hardly pass through the country without

seeing that what Mr. Scott said was true. But one felt particular regret at witnessing the condition of our ancient buildings; no one seemed to care for them, and they fell into decay and even disappearance. He knew very strong instances, and amongst them that of the marvellous Abbey of Whithy; he thought in a few years the whole of that abbey would be down, though the expenditure of a little money would have sufficed to save at least large portions of it. No doubt the extremely exposed situation and the very bad material of which a portion of it was constructed, would prevent their preserving its artistic architectural features. He merely mentioned that as an instance of the loss of our ancient cathedrals and castles, where the expenditure of a few pounds would save them. With regard to the vexed question as to the nature of restoration, he had heard much discussion about it, and it was a difficult thing to decide what should be done. But their friend Mr. Scott's suggestions, he thought, were very valuable, showed great experience, and indicated practical utility. What Mr. Scott said was every day becoming more obvious. A paper such as that which had been read that evening, characterised by such practical skill and knowledge and wonderful taste and judgment, would undoubtedly be of great value generally. As to what the French were doing he thought they showed a marvellous skill in their particular style of architecture, though in many cases they were exposed to the charge of recklessness in their treatment of ancient buildings. However, there was much to be said about what had been done to take away the effects of the ravages of time and decay. He dared say the paper itself was of that nature which did not enable one immediately to go into a discussion upon it. With these few remarks, however, he would invite Mr. Burnell to say a few words on a subject to which he had paid great attention.

Mr. G. GODWIN wished to ask, before Mr. Burnell addressed the meeting, whether the moment had not now arrived when the Government would be persuaded to issue a commission for a general examination of ancient buildings, or to obtain reports from all parts of the country, in order to ascertain what buildings had guardians, those which were without attendance, what were under decay, and what not. When Mr. Hume was in the House of Commons, active exertions were made to obtain the appointment of such a commission in this country, and Mr. Hume, who urged in the House night after night the saving of money, saw that money could not be better expended than in retaining ancient structures. It seemed extraordinary that, with all the large architectural and archaeological societies in existence throughout the country, destruction should go on of the most deplorable character. It was desirable that some body should be appointed by the Government to initiate such inquiries as he had referred to, and he thought they would find a disposition on the part of the Government to appreciate the proposal, although Governments had behaved most infamously in regard to art, science and antiquities.

Professor DONALDSON said it seemed to him best to resolve themselves into a practical body to carry out the object of Mr. Scott. And he thought they might approach the First Commissioner of Works to ask him to get a return made out of all ancient monuments under his care. There were several properties, it was found, in process of decay which ought to be preserved, and which it was the duty of Government to preserve. If they asked the First Commissioner to cause such a return to be made, he thought the request would be granted.

Mr. G. R. BURNELL said Mr. Scott's paper related to so many points of interest that he felt incompetent that night to go into the matter, and if it snited the views of the Institute he should prefer postponing what he had to say to a future occasion—(Hear). The paper was full of matters of detail which would have to be fully and carefully considered—(Hear, hear).

The further discussion of the paper was then postponed until such an evening as the Council should appoint.

Mr. DRIGBY WYATT thought they must all feel highly gratified by the paper which Mr. Scott had read that evening—(Hear, hear). Monuments of art were to them one common property as architects, whether in Italy, France, or England; they must feel a common interest in them wherever they might be. He proposed a vote of thanks to Mr. Scott.

Professor DONALDSON seconded the motion, which was carried amidst loud applause.

Mr. SCOTT briefly acknowledged the compliment, and hoped the reading of the paper would lead to some practical result.

New Members.—The following gentlemen were duly elected:—Mr. John Young, Jun., of 35, King-street, Cheapside; as Fellow. Mr. Charles Robert Baker King, of 24, University-street; Mr. Benjamin Taberner, of 20, Bedford-place, Kensington; Mr. Henry Wood, of 12, Richmond-terrace, Clapham; as Associates.

ELECTION OF DISTRICT SURVEYOR FOR CHELSEA.

LAST Friday the Metropolitan Board of Works elected Mr. Sancton Wood as District Surveyor for the parish of Chelsea. There were 23 candidates for the office, viz.: Messrs. Andrew Moseley, John Billing, Richard Richardson, John W. Papworth, Sancton Wood, William Lighty, S. Salter, Jun., Samuel Hill, Sydney Godwin, Thomas Edward Knightley, Henry S. Legg, Horace Field, Joseph Liddiard, Arthur Cates, Edward Roberts, Samuel L. Markham, Josiah Houle, Edward Paraire, Robt. Kerr, Henry Laxton, Arthur J. C. Baker, Alfred Williams, and John Cole. It was arranged that the list should be reduced to six on the first voting. At the close of the first voting the following were the six who had the highest number of votes: Messrs. Billing, Papworth, Wood, Knightley, Kerr, and Cole. Eventually the election fell on Mr. Sancton Wood, which causes a vacancy in the surveyorship of Putney and Roehampton.

CONDEMNATION OF OLD HOUSES IN KIRKALDY.—Since the late sad catastrophe in Edinburgh, the authorities in Kirkalady have been making inquiries into the state of some of the old houses. The result has been that a number have been condemned, and the inhabitants ordered to remove immediately. A number of them have already been pulled down. On the proprietors being made aware of the untenable state of their houses, they got an examination made by practical men, who concurred in the sentence passed by the authorities.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 23 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

LONDON AND PARIS HOSPITALS.

Galiquan's Messenger reports a discussion which took place a few days ago at one of the sittings of the Académie de Médecine on the relative sanitary condition of the hospitals of Paris and London. Dr. Gosselin stated that from what he had been told by various foreign surgeons, and also by French physicians who had visited foreign hospitals, there existed a considerable difference in the results obtained in the English and German establishments of the kind compared with those in Paris. The sick-wards of the London hospitals were much better aired, being provided with large stoves, which gave rise to draughts and consumed the vitiated air of the rooms; patients who were able to walk took their meals in dining-rooms apart from the sick-wards, an arrangement which greatly diminished the crowded state of the infirmaries, and contributed towards maintaining the purity of the air; the floors were frequently washed, which prevented the accumulation of dust, while the beds had no curtains, whereby miasmatic emanations were better dispersed; and, lastly, the linen department was the object of particular care.

Dr. Davenne differed in opinion from the former speaker, and maintained that the manner in which the Paris hospitals were conducted was far superior to the London system. If the sanitary condition of the latter was better it was owing to the fact that their population was smaller, because the paupers relieved by the poor-tax were not admitted into them. He then quoted some statistical documents to show that the mortality in the Paris hospitals had been constantly diminishing since the commencement of the present century.

Dr. Malgaigne, adverting to an old report of Dr. Tenon's, who had visited the hospitals both of London and Paris, remarked that the author proposed to limit the sick-wards to the ground floor and first story only, every sick-ward containing 24 beds at the utmost. In 1814, he added, the slaughter-houses of Paris were transformed into hospitals, and the results of this measure were curious. The mortality of the French operated on in the common hospitals was one in five, eight, nine; in the slaughter-houses, one in 10, 12, 13. The mortality of the foreign soldiers operated on in the hospitals was one in 7, 13; in the slaughter-houses, one in 10, 19. This showed that the mortality was lowest in the best-aired situations. As to the London hospitals, there was one fact to be taken into account, viz., that the sick admitted into them were much more seriously ill than those admitted into the Paris hospitals. Out of 100 patients operated on in each city, 56 died in Paris, and only 30 in London. Out of 100 amputations of the thigh, 60 ended mortally in Paris, 21 in London, and 19 at Manchester, where the hospitals have the advantage of the country air. Now what was the reason of this enormous difference? Simply, that while in the Paris wards there are as many as 80 beds, there are only 12 in the London ones.

The discussion is likely to be continued at a future sitting.

METROPOLITAN BOARD OF WORKS.

A MEETING of this body was held on Friday last, at the Board-room, Spring-gardens; J. THWAITES, Esq., the Chairman, presiding.

Erection of a Gas Testing House.—The CHAIRMAN stated that it being urgently requisite to have erected as speedily as possible a gas testing-house in the new street in Southwark (under the Sale of Gas Act), the Gas Committee had invited six builders to send in tenders for the same. Five of the gentlemen to whom the invitation was given sent in tenders, which were as follow:—Messrs. J. Wilson and Son, £1,979; Mr. Edward Thirst, £2,015, and £36 for extras; Mr. W. S. Nixon, £1,749, and £38 for extras; Mr. A. E. Robinson, £1,810, and £44 for extras; Mr. W. Downs, £1,835, and £36 for extras. The estimate of the Superintending Architect was £1,450.

After some discussion, the subject was referred back to the Committee, with power to deal with the tenders.

The Board then proceeded to the election of a surveyor for the Chelsea district.

City Improvements.—A report from the Works and Improvements Committee stated that though the improvement now being carried out by the Commissioners of Sewers of the City of London, at No. 60, Great Tower-street, would be attended with considerable public benefit, the Committee, having regard to the fact that the fund at the disposal of the Board for the purpose of metropolitan improvements is exceedingly limited, and to the necessity of their diffusing, as far as may be practicable, street improvements of this nature over the entire area of their jurisdiction, are not at present prepared to recommend a contribution in the above case.

Mr. H. L. TAYLOR moved an amendment against the adoption of the report, that the Board contribute one-third of the cost, or £32 13s. 4d., towards the improvement.

The amendment was, after a long discussion, carried by a majority of 4.

The consideration of a report from the Building Act and General Purposes Committee, on the reference by the Board of the 28th June, 1861, as to the necessity for some immediate legislative provision to prevent the building of warehouses, &c., with iron doors; and submitting suggestions by the superintending architect for the amendment of the Metropolitan Building Act, 1855, was postponed, *sine die*.

Utilisation of the Sewage.—The Board was informed that the Main Drainage Committee had prepared a very long report, stating that the Committee entertain very favorably the proposition for dealing with the sewage of the northern area of the metropolis, contained in the communications from the Hon. William Napier and William Hope, Esq.; and recommending the Board to assent to the principle of a concession of the sewage, for a term of fifty years, provided the requisite authority be granted by the legislature to the Board, and subject to the introduction of all necessary clauses in the Bill for the protection of the Board, and of the public interests confided to them, and for ensuring the fulfilment by the Company of the obligations undertaken by them.

The report was not read, but ordered to be printed and circulated amongst the members, and taken into consideration at the meeting of the Board this day (Friday).

Progress of the Main Drainage Works.—The engineer, Mr. Bazalgette, reported that the progress of the Main Drainage Works during the past month has, on the whole, been satisfactory, although, at this period, the short days and the unsettled state of the weather necessarily retarded all building operations. Mr. Furness has now completed all the brick piers, abutments, and wing walls of the bridges over the rivers, railways, and roads, except the Stratford-road between Bow and Plaistow; and the iron girders and superstructure are being cast and fitted at the founder's, and gradually delivered on the works. The

concrete foundations and brick inverts of the sewers are extending over the whole line of works. At the beginning of last month 45 cross trenches remained to be completed between East Ham and Barking; 30 of these are now finished. These cross trenches have been excavated to a depth of from 12 to 14 feet through the peat, and are fitted with concrete piers at from 20 to 30 feet apart, and on these are constructed brick arches upon which the three parallel tunnels are carried. The value of the work executed under this contract up to the present time is £151,000. Messrs. Brassy and Co. have completed about 19,450 feet of the Middle Level Sewer, at an expenditure of about £91,000, and Mr. Dethick has finished 5,633 feet of the Ranelagh Storm Overflow at a cost of about £26,500. Mr. Webster has now successfully completed about six miles of the Southern Outfall Sewer at an expenditure of £250,000. Messrs. Aird have made considerable progress with the Deptford Pumping-station, the engine-house having been raised 30 feet above the foundations. The Low-level sewer under Deptford-creek is progressing, and the iron pipes under the creek, which will form the connexion between the engine-house and the High-level sewer are nearly completed. The value of the work done under this contract is about £50,000. Under the Southern High-level sewer contract 7½ miles of sewers have been finished at an expenditure of about £138,000, and I regret to report that I am still unable to express myself satisfied with the contractor's mode of conducting those works. Messrs. Slaughter and Co. have so far progressed with the engines and pumps for the Deptford pumping-station that the Board have during the past month felt justified in making them a further advance of £5,000 on account thereof. Although it does not form a portion of the main drainage, I may here mention that of the Southwark and Westminster communication, Mr. Pearson has completed 280 feet of subway, 335 feet of sewer, 40 vaults, and a proportionate number of house drain connexions. The materials and workmanship in the foregoing works are generally of a solid and satisfactory character, and mostly reflect great credit upon the contractors.

NOTES FROM THE PROVINCES.

Ashford Corn Exchange.—This edifice erected on a piece of ground opposite the Cattle-market is now completed. The room, lighted entirely from the ceiling, is 98 feet 6 inches by 48 feet 8 inches, and 35 feet in height. There are also ante-rooms 32 feet by 16 feet, and 16 feet by 16 feet, and some very extensive cellars. The architect is Mr. R. C. May, of St. George's-street, Westminster; and the builder Mr. Perry, jun., of Dalston. The total cost is about £4,000.

Wrexham.—*Offices for the Provincial Insurance Company.*—Says the local *Advertiser*,—"The new offices of the Provincial Insurance Company are now completed. The large office in which the whole of the 'ready writers' are at work, is the finest room in Wrexham. It is large, warm, light, and well ventilated. A strong fire-proof room opening into the large room keeps in the utmost safety all the valuable books, papers, and deeds, belonging to the establishment, the close proximity of which to the general clerks' office greatly facilitates the progress of the general business. The Board-room, the Committee-room, and the private room of the secretary are in front of the building—double windows obviate any nuisance that might arise from the noise of the traffic in the street—and double doors preserve the privacy and ensure the quietude of these rooms on the other side. The same completeness prevails throughout the entire building. There is hot water and cold water everywhere at command, a large hoist to lift up heavy materials from the cellar to the summit of the building, and a smaller one to lift up lighter articles, a telegraph to call the clerks, to point out which clerk is wanted, and to indicate where he is wanted. There is 'a place for everything and everything in its place.'"

The Nottingham Surveyorship.—At a meeting of the Town Council of Nottingham as to the surveyor's salary, it was unanimously resolved that the sum of £250 per annum now paid was totally insufficient, and that it be forthwith increased to £350, and a further amount of £50 to be added after Michaelmas next.

Clifton Suspension Bridge.—We understand that the chains, &c., of Hungerford-bridge, which have been purchased for completing this long-unfinished undertaking, will be delivered in Clifton in June next, when the operation of suspending them between the piers erected on the Gloucester and Somerset sides of the Avon will be immediately commenced.

The New Guildhall at Cambridge.—The improvements at the Guildhall are rapidly approaching completion. The aldermen's parlour and the old assembly-room are available for public meetings and are a striking contrast to their former state. The suite of rooms appropriated to the School of Art are capacious and convenient. The large assembly-room is progressing, the plastering is nearly finished, and the floor will soon be laid.

Abergavenny.—*Bursting of the Canal.*—On Wednesday the 18th ult., the inhabitants of Llanfoist were aroused by the sudden and unexpected bursting of the canal. About eighteen months ago a similar disaster occurred in the same neighbourhood, not more than five hundred yards distance from the scene of the present, which is near Llanfoist Great House. The destruction caused by the flood was very serious, trees of immense size being washed away. The village of Llanfoist was inundated in many places to the depth of 2 feet, and when the water was stopped, the roads were at least 6 inches deep with sand and mud. The park presented a remarkable appearance. The quantities of stone washed down for several hundreds of yards are computed at a thousand tons. Had the breakage taken place one hundred yards above, the Great House would have been in jeopardy. The damage is said to amount to £500.

The New Staff College, Sandhurst.—The erection of this extensive structure is rapidly approaching completion, and the building will, in all probability, be out of the hands of the workmen by the month of March. A few years ago, and subsequent to the Crimean war, a senior department was added to the Royal Military College for officers who, having served a probation in regimental duties, seek by a higher course of training to qualify themselves for staff appointments; but adequate accommodation could not be afforded, and it was resolved that a college for this exclusive purpose should be erected, and about the middle of December, 1859, the foundation-stone was laid by the Duke of Cambridge, with whom it is said the scheme originated. The work is carried out under the direction of Captain Pelly, R.E., who is assisted by E. Bowdler, Esq., of the Civil Staff. The new College is situated on a gentle slope, about half a mile to the eastward of the Cadets' College, and within the spacious grounds belonging to that establishment. The style is modern Italian, freely treated, and the material is brick, with stone facings, the lower part being stone. The length of the main

building is 265 feet, by 110 feet deep (exclusive of internal offices), and its height from the ground about 60 feet. There are towers at the north and east ends, and another in the centre of the front; on a pediment are the royal arms, surmounted by the crest of the college. There will be quarters for 40 students. The interior is approached by a vestibule, leading to a large hall covered by glass, and giving access to the principal staircase and corridors. The hall on the first floor has rows of Ionic columns. The corridors are lighted with large open courts, but these will probably, after a time, be covered in with glass roofs. The principal apartments comprise three large halls of study, two libraries, lecture theatre, class lecture-room, model-room, and mess-room (60 feet by 30 feet), which has been constructed in such a manner that it can readily be made applicable for balls, &c. North-west of the college are detached residences for the commandant and adjutant, and nine houses for professors will be commenced in the course of a few weeks. Attached to the north end of the building are the kitchen and other offices of that description. At the back of the college are stables for 48 horses. The contractor is Mr. Myers.

Chatham.—*St. Bartholomew's Hospital.*—The works on this extensive pile of buildings is being rapidly pushed forward. The building is of brick, with white stone dressings, and may be described as Elizabethan, though no very great ornamentation will be attempted. The hospital consists of a centre building, and two wings, together with a large range of buildings intended as a dispensary, chiefly for the treatment of out-patients, at the rear. In the design of the building advantage has been taken of the sloping character of the ground on which it is built to form the dispensary building. Entering the building at the back the out-patients will be received in a general waiting-room, communicating with which are the surgeries, dressing-rooms, dispensing-rooms, and other apartments. From this portion of the building admission is gained to the ground-floor of the hospital, along which runs a corridor the centre length of the building. The west wing contains the lock wards, together with the usual dormitories and rooms for the nurses on the ground floor, also day-rooms, recreation apartments, bath-room, servants' hall, sculleries, &c. In this part of the hospital are the cooking-rooms, stoves, &c. The east wing contains the charity wards for the reception of general patients, the wards being the same as those in the corresponding wing. It also contains a day-room 54 feet in length, for the use of convalescents. Ascending to the first floor, with which the entrance from the New-road communicates, the centre building contains an entrance hall, communicating with which are the house surgeon's apartments, chapel, and, on the opposite side of the corridor, the dispenser's rooms. On this floor, in the west wing, is also another lock ward 57 feet in length by 24 feet in width, and in the corresponding wing on the opposite side of the building a charity ward, 90 feet by 24 feet. This floor also contains wards for special cases, together with steward's rooms and apartments for the nurses. The centre building on the second floor contains the board-room, matron's rooms, and apartments for the hospital clerk. The operating-room and lecture-room are placed at the rear, over the dispensary building. The wards and other apartments on this floor correspond with those in the other parts of the building. There is likewise a third floor to the centre building, which will be used entirely for the general stores required in the establishment. At the point where the east wing joins the centre building it is intended to erect a lofty square tower, which will rise to a height of nearly 50 feet above the building. This tower will contain a cistern for the water supply for the hospital, and a clock, with four illuminated dials. The hospital is expected to be finished very shortly. There will be accommodation for one hundred patients.

Hospital for Birkenhead.—Mr. John Laird, the new member for Birkenhead, has offered to build an infirmary and hospital for the new borough, including Birkenhead, Claughton, Oxtan, Tranmere, and Bebington, at a cost of £3,000, and the committee have accepted the terms of his proposal. Mr. Walter Scott is to be the architect of the new building.

New Lighthouse on the Clyde.—The improvements on the channel of the Clyde between Greenock and Dumbarton have necessitated the erection of a new lighthouse on a perch opposite to Port Glasgow harbor, about 300 feet from the shore. The new lighthouse is of iron, circular shaped, 11 feet in diameter, and resting on a circular ashlar foundation. The lantern is about 6 feet in diameter, and is covered by a copper dome, the whole rising about 30 feet above high-water mark. Within the last few days it has been successfully lighted with gas, which is conveyed from Port Glasgow through a pipe sunk at the bottom of the river, and as the gas can be turned on and off in Port Glasgow, there is no necessity for constant attendance in the lighthouse, a man only requiring once a day or so to wipe the reflectors and the glass of the lantern.

Colchester Camp.—The plans for the erection of the first section of the new cavalry barracks here have now been definitely determined upon, and the tenders for the work are to be sent in. The erections for the men are to be of red brick, two-storied, and to be formed in blocks, each for the accommodation of seventy-two men. The rooms, which will be about 20 feet in length, are to accommodate in each eighteen men. The officers' quarters will be three-storied.

CRYSTAL PALACE FOR THE PARISIANS.—We understand that a *société anonyme*, with a capital of 25,000,000 francs, is in course of formation for constructing a "palais de crystal" in the Bois de Boulogne. The council of administration comprises a number of gentlemen well known both in France and in this country, the French portion including the Marquis de la Roche-Aymon, Count de Santivy, the Marquis de Monclar, M. Pasqualini, and Prince A. Galitzin; and the English portion, Messrs. S. Beale, M.P., T. N. Farquhar, and William Jackson, M.P. Sir Joseph Paxton has accepted the office of architect in chief; Mr. Edwin Clarke that of consulting engineer; and Mr. Thomas Brassy that of contractor-general. It is intended to make the Crystal Palace of the Bois de Boulogne especially attractive by concentrating within it magnificent halls for public entertainments, and a vast nave for the exhibition of fine arts, manufactures, and horticulture. The exhibitions will be permanent, and it is anticipated that new intercourse will be created between producer and consumer unbarren by intermediaries or by distant and uncertain correspondence. To provide for the general expenses the sinking fund and the maintenance of the building, &c., there would be the rents from exhibitors, the rents of restaurants, cafés, &c., the commission on the sale of pictures, statues, objects of art, and flowers, the reserved seats, and the rents for advertising placards, so that the entrance money will represent the profit to the shareholders, which it is considered will be equal to 30 per cent. on the capital.

Reviews.

Gothic Memorials. By W. C. Brangwyn, Architect, Compton-road, Wolverhampton.

OF which the first part is before us; consists of twenty plates, drawn by the author and printed at the Anstatie press of Cowell, Ipswich. The work is described as intended to contain sundry sketches for mural monuments, headstones, crosses, &c. The designs are not all of equal merit, but several are rendered more valuable by the introduction on the plates, of sections and sketches of details to an enlarged scale.

The Royal Engineer Department: Its Work and the Estimates. By Argus; Hardwicke, 102, Piccadilly.

WITHOUT going quite to the extent that "Argus" does in his attack on the Department, we agree that it would

Be an interesting inquiry on the part of some member of the House of Commons to call for a return of the fortifications constructed within the last ten years, the names of the engineers who drew the plans, the amount of the estimate on which the money was granted, the amount of the accepted tender, and the actual sum or sums paid for each work up to the time of its completion; and what portion of these works have had to be taken down or have become obsolete by the scheme proposed by the Defence Commissioners.

It is said that—

The Defence Grant is being expended on a German system of fortification, rendered obsolete by modern improvements in the mode of attack. We have ill-ventilated casemates, counterarched revetments, the substitution of caponiers, and detached Carnot works, as if all modern artillery was to be superseded by the primitive weapons of our ancestors.

The author does not desire to question the intelligence, honor or courage of the officers of the Department, but protests against their being employed on works unless they are fully qualified for the duty, and remarks that—

It is now well known that all War Department works are really superintended by broken-down civil engineers, architects, or builders, to whose necessities circumstances rather than the remuneration, the Government are indebted for their services, and who, under the title of clerks of works, perform the duty which the public suppose to be performed by the officers of Royal Engineers; and it is worthy of remark, that no puppet showman ever takes so much care to conceal the hand which pulls the strings as the officers of Royal Engineers, to hide the clerks of works from public view. But as in the best performance a glimpse may be caught of the real actor, it has been the policy of the Royal Engineers to so bespatter the civil officer with dirt, that his recognition in public will be rendered improbable; and also introduce men of inferior position and attainments into the service, with the view of depreciating it in the estimation of the authorities and the public.

Report of the Council of the Art Union of London.

THE annual report of this Council shows a falling off in the subscription list during the past year, attributed in some measure, to the depression in trade, &c., and also to the fact that several other projects with the same end in view, now bid for the patronage of the public.

The Council state that they do not of necessity regard those projects in any inimical spirit so long as the means employed are judicious and legitimate, they are glad to see others exerting themselves to forward the same cause in which they have long labored.

Subscribers for the ensuing year will each receive an engraving by Mr. Sharpe, from the picture by Mr. F. Goodall, A.R.A., called "Raising the Maypole."

It is further mentioned that the council have presented a memorial to Government, "praying for the adoption in the several galleries and museums of the nation, of the uniform plan of opening them to the general public every day in the week except Sunday, but with a charge of sixpence for each person (except students) on Thursday and Friday. They hope that this proposed may be entertained, and the plan fully adopted by the time of the opening of the International Exhibition, so that the visitors to London both native and foreign, may have the benefit of the removal of the uncertainty now caused by the conflicting rules for admission observed at the different national collections." It is not easy to understand why a charge of sixpence should be made on two days in the week for admission to our present free exhibitions.

The Art-Union of London Almanac.

APPEARS in a newly designed cover of Gothic character. It contains information in a very condensed form on art societies and exhibitions, collections of pictures, and some other matter now almost peculiar to almanacs.

The Practical Mechanic's Journal.

THE January number of our contemporary contains a paper on the Annealing Temperature of Metals and Crystallisation produced by Vibration, an account of the machinery of the *Octavia* and the *Mooltan* steamers. An article on Inventions and Protected Patents; another on Subterranean Railways in the Metropolis; descriptions and illustrations of Patents; Law Reports of Patent Cases, and some usefully brought together "monthly notes," &c.

Correspondence.

WHAT IS AN ARCHITECT?

SIR,—Will you kindly allow the following to appear in your Journal? It would have been written before, but I was in hopes that some one better able than myself would have written to you on the subject.

At the Society of Arts on the 4th ultimo, during the discussion which followed the reading of a paper by Captain Phillips on the Building for the International Exhibition this year, Mr. Henry Cole said "when the Royal Commissioners for 1862 entered upon their functions Captain Fowke had plans ready." Can Mr. Cole state how it was that Captain Fowke happened to have plans ready? Who commissioned Captain Fowke to have these plans prepared? Did he have them prepared at his own expense, or was the expense charged to the vote for the Department of Science and Art, and, if so, by whose authority? And if Captain Fowke was commissioned to have plans prepared, why was he, and he only, selected?

I wish to be careful as to the difference between *preparing* and *having prepared*, because I should be sorry to charge Captain Fowke with the design for the Exhibition. The credit of the design now in question belongs to some of the very numerous architectural assistants who are employed under Captain Fowke, at Kensington—as in all other cases where military Engineer officers are engaged on civil duties.

AN ARCHITECTURAL ASSISTANT.

IMPROVEMENTS IN BUILDING, &c.*

IN THE CONSTRUCTION OF ARCHES OR OTHER CURVED STRUCTURES, MADE BY BRICK, STONE, OR OTHER MATERIALS.—Dated June 3, 1861.—J. D. Davidge.

This consists in making two sides of one of the pieces to be used in the construction of a double wedge shape, pointed at one end, and square at the opposite end. The inventor also forms the two sides of another piece to be used in the construction of corresponding alaps to the sides of the aforesaid double wedge shape piece, so that, when two or more of such pieces are fitted one against the other, and an arch or other curved structure built therewith, the same shall be self-supporting, and when put together with cement form a very strong piece of work.

IN THE CONSTRUCTION AND INTERNAL ARRANGEMENT OF FURNACES, AND IN THE PREPARATION, MANUFACTURE, AND TREATMENT OF CLAYS, AND OF ARTICLES, SURFACES, STRUCTURES, AND ERECTIONS, SUBJECT TO THE ACTION OF FIRE OR ATMOSPHERIC INFLUENCES.—Dated May 29th, 1861.—T. Hale and A. Wall.

This consists in erecting in the furnace, in contact in or near to the fire, a wall or partition, or a chamber, or two or more chambers, with openings or perforations through or into which the smoke, gases, or vapors arising from the combustion of the fuel, or the air before coming in contact with the fuel, are to pass. The inventors add to clay in the process of manufacture a preparation of powdered asbestos, pumice-stone, or lava, magnesia, and bone ash.

IN THE MANUFACTURE AND ORNAMENTATION OF METALLIC CHIMNEY-PIECES, OR MANTEL-PIECES, AND IN THE ORNAMENTATION OF METALLIC STOVES AND FIRE-PLACES.—Dated May 29, 1861.—H. Crichtley.

The patentee claims making metallic chimney-pieces, and plates or sheets of metal, jointed together by rivetting, screwing, soldering, &c. 2. Ornamenting metallic chimney-pieces, and also stoves and fire-places, by affixing ornamental paper to those parts of the chimney-pieces, &c., which it is wished to ornament.

AN IMPROVED WINDOW SEAT, PART OF THE INVENTION BEING APPLICABLE TO OTHER PURPOSES.—Dated May 30, 1861.—W. B. Roof.

This consists of a seat with sides and a back (or only a back without sides), formed of wood or otherwise, and so constructed that it shall rest on the window-sill and hook on to the inside of the window frame.

COMPOSITION TO BE USED IN SUBSTITUTION FOR BRICK AND STONE, AND AN IMPROVED METHOD OF CONSTRUCTING WALLS AND ROOFS FOR HOUSES, &c.—Dated June 4, 1861.—S. Standfast.

This improved composition is formed by running into blocks the following ingredients:—Burnt clay or loam, iron dust, brick rubbish, gravel, hoop iron, wire, lime, cement, vegetable fibre, animal hair, and sand. The improved method of constructing walls and roofs consists in the employment of hollow frames or moulds formed of wood or metal, between which the above named ingredients are run or placed in a loose state, the material for forming the outer face of the wall or roof being first applied against the inside of the material forming the outside of the frame or mould. The materials form one solid compact and jointless body. After they have become set and solidified the frames or moulds may be removed. The patentee prefers to construct the chimneys and flues required in the building by letting into the composition glazed earthen pipes.

A CONE PREVENTING SMOKE AND EXTINGUISHING FIRES IN CHIMNEYS.—Dated 16th June, 1861.—A. L. C. de Montagu, Paris.

This invention consists in the peculiar construction and application of a chimney cover or pot for preventing, in any weather, chimneys from smoking in the interior, and for facilitating the extinguishing of fires therein. This conical cover may be made of strong sheet iron, baked earth, or other suitable material, and is fitted to the upper opening of the chimney duct. The diameter of the base of the cover is equal to that of the orifice which it covers, and its height about double the diameter of its base; the top of the cover is truncated by a section perpendicular to its axis, and is of a diameter equal to one-fifth of the diameter of the base for fuel, giving off little smoke; the upper half or cone is perforated with holes of a diameter equal to a twentieth of the diameter of the base, with an interval between each of them equal to double their diameter.

IN THE FORM AND CONSTRUCTION OF CHIMNEY TOPS, OR APPARATUS FOR SURMOUNTING CHIMNEYS IN ORDER TO REGULATE THE UP-CURRENTS AND PREVENT THE DOWN-DRAUGHTS.—Dated June 12, 1861.—J. Durrant and N. A. Harris.

This invention consists of a cylinder of metal, preferably zinc or earthenware, or other suitable material; on the top of this the patentees fix, or attach, or form a series of corrugated cells, opening towards the bottom, so as to receive the external air, which passes out of the top into the interior of an open conical cap fixed there. These cells may be either slightly inclined or vertical; the band on which these cells are affixed, as before stated, opens into a conical cap, which is affixed to, and opens into, and encircles the cylinder. Round the outer periphery or surface is another series of conically shaped cells, the bottom of which, being open, receives the outer air, and passes it into the interior of another conical cap placed directly over it and concentric with the cylinder.

1. SMOKE-CONSUMING GRATE.—Dated June 12, 1861.—L. J. J. Petre.

This invention relates to a new arrangement of furnace grate for the consumption of smoke, composed of fire bars, each having two parallel side cheeks or flanges, connected at the upper part at intervals by the pieces cast on the cheeks. The upper surface of the fire bar may be of a round, square, elliptical, triangular, or other form; it is also provided at intervals with elongated holes, arranged in various ways, to allow air introduced at the under part of the grate to pass between the cheeks, and through the tubes in the bars into the centre of the fuel, so as to obtain more perfect combustion.

AN IMPROVED "FLOOR-BOG," OR CRAMP.—Dated June 12, 1861.—G. Cox.

The object of this invention is to obtain sufficient pressure against the edges of floor boards to keep them in position and close together during the operation of nailing to the joists. The inventor proposes using a lever of cast or wrought metal, about the thickness (or rather more) of the floor board; on the under side of this lever are placed two lugs or pegs, rather further apart than the width of the joist, so that when the lever is brought back from the right angle to the joist, the lugs or pegs firmly grip each side of the joist, while a wooden bar, which is jointed to the lever, presses a driver, also of wood, against the edges of the floor board. This driver is to be driven by blows from a hammer or mallet in a parallel line with the floor boards, which tends to bring the driver from the oblique line to the rectangular, thus forcing the floor boards together during the operation of nailing to the joists.

New Iron Bridge over the Mersey.—Messrs. Bellhouse, of Manchester, have recently erected a foot-bridge over the Mersey at Northenden. The bridge spans the river by means of two wrought-iron lattice girders, of ornamental open design, the width of the river being nearly 85 feet. Each girder is 88 feet long, 6 feet deep in the centre, and 2 feet 6 inches deep at the ends; the space between the two girders is 6 feet, which is filled in with cross beams and planks, forming the footway. The bridge is carried upon eight cast-iron piles, four at each end, 8 inches in diameter, driven about 16 feet into the ground. The footpath is continued to the top of the bank on each side of the river by iron beams, plank-ing, and railing. There are two arches of cast-iron, with shields having armorial bearings thereon, connecting the upper parts of the lattice girders; and in one of these there is an iron openwork gate.

TENDERS.

KENT COUNTY CONSTABULARY STATION.

Alterations and additions to buildings at Wren's-cross, Maidstone, for head-quarter's station. Mr. Bulmer, county surveyor. Quantities furnished by Mr. George Ruck.			
Naylor	£1,627 0	Bates	£1,470 10
Holloway	1,567 0	Wallis	1,465 0
Ayers and Son	1,550 0	Clements	1,465 0
Chambers	1,518 0	Grensted, Bridge, and Son	1,443 0
Cobb	1,476 7	Sutton and Vaughan (accepted)	1,396 0

HOTEL, ALDERSHOT.

For a new hotel in the Bank-street, Aldershot, for Mr. Thomas Taunton. Messrs. Eggar and Stapley, architects, Farnham and Aldershot.
J. Martin, Aldershot. £2,550

CHURCH, LIVERPOOL.

For erecting St. Martin's District Church, Liverpool. Messrs. W. and J. Hay, architects. Quantities taken out by Mr. Sherlock.

	First Plans.	Second Plans.
R. Wells	£3,020	£1,480
J. H. Mullin	3,091	1,476
J. Westmoreland	3,030	1,461
Nicholson and Ayre	3,072	1,381
Hugh Yates	2,960	—
Wm. Tomkinson (accepted)	2,799	1,335
Lapsley and Morloe	—	1,155

COMPETITIONS OPEN.

BRIDGE.

BRISBANE RIVER.—The Municipality of Brisbane are prepared to receive designs and tenders for the construction of a bridge over the Brisbane river, at Brisbane, the capital of Queensland. The author of the best design, at the lowest cost, will receive a reward of £150, or be employed to carry the work out, providing he furnishes sufficient proof of his competency and experience in similar undertakings. A premium of £80 will be awarded to the next best design, and £40 for the next best. The plans, specifications, and estimates of the first and second designs will be retained by the Corporation as their property. The remainder will be returned to the competitors; but the corporation will incur no responsibility as to their safe delivery. Each set of drawings, and the documents accompanying them, are to be distinguished by a motto only, and accompanied by a letter in a sealed envelope, marked with the same motto, and containing the author's name and address, and such testimonials as he may think proper to furnish. Professional judges, being non-competitors, will be appointed by the Corporation to determine the merits of the respective designs. Eligible tenders for the work, accompanying the design, will be entertained. All drawings and tenders to be delivered at Gresham House, on or before the 15th of March next. Copies of the instructions to competitors, and the plan of the city, can be obtained of F. Mangies and Co., the Colonial agents, and agents to the Municipality of Queensland, 86 to 88, Gresham House, Old Broad-street, London, E.C.

THAMES EMBANKMENT.

LONDON.—The Commissioners are open to receive plans for embanking the Surrey side of the river Thames, within the metropolis, which will conduce with the greatest efficiency and economy to the improvement, embellishment, and convenience of that part of the metropolis, will improve the navigation of the river, and will provide a public thoroughfare without stopping such trade as must be carried on upon the bank of the said river. Plans must be sent in on or before Monday, the 13th January.

CONTRACTS OPEN.

GAOL.

MONAGHAN.—For the alterations and additions to Monaghan Gaol. Plans, &c., to the 2nd of February next, at the gaol, and at the office of the architect, Mr. John McCuddy, 34, Westland-row, Dublin. Sealed tenders to be delivered at the gaol, before 3rd of February.

DWELLING-HOUSES.

DUMFRIES (N. B.).—For the mason, joiner, and other works required to erect and complete the following buildings on the Estate of East Tinwald, for M. Carthew Yorston, Esq.:—1. A dwelling-house and steading of offices on the Farm of Fernyleuch. 2. Two cottages on the Farm of Fernyleuch. 3. A dwelling-house and steading of offices on the Farm of Bruntshields. Plans, &c., with James Barbour, architect, Dumfries, to whom tenders on or before January 28th.

CHURCHES.

IRELAND.—For works to be executed at the churches of Inistogue, co. Kilkenny; Donoghmore—Stradbally, Queen's Co.; Kinsale, co. Waterford; and for building the church of Glengariffe, co. Cork. Plans, &c., with the resident ministers of the parishes. Tenders to be directed as follows:—"Proposals for —, the church of —, The Ecclesiastical Commissioners for Ireland, Dublin," before Jan. 16.

RECTORY.

RADNORSHIRE.—For building a rectory-house and offices at Norton, near Presteign, Radnorshire. Plans, &c., with Thomas Nicholson, F.R.S.A., diocesan architect, St. Peter's-square, Hereford. Tenders to be delivered to the architect, on or before the 18th of January.

WAREHOUSE.

LEEDS.—For the erection of a warehouse in Park-place, Leeds. Drawings, &c., with T. Ambler, architect, 10, Park-row, Leeds, from the 13th to the 21st January. Tenders to be sent to Mr. Ambler not later than 12 a.m. on the 23rd January.

WATERWORKS.

GLOUCESTER.—For providing and fixing at the Gloucester waterworks. Contract 1.—Two wrought iron triangular girder foot bridges, 96 and 88 feet span, with iron fencing. Contract 2.—About 800 yards of wrought iron continuous fencing, and other works, at Witcombe, about six miles from Gloucester. Plans, &c., at the office of Mr. W. Mc Landsborough, A. I. C. E., surveyor to the Local Board, Corn Exchange. Tenders to be sent to Mr. K. H. Fryer, clerk to the Local Board, Gloucester, under cover, addressed to the Gloucester Local Board of Health, on or before the 15th inst.

VILLAS.

ESSEX.—For the erection of a pair of Villas, at Witham, Essex. Drawings, &c., with Fred. Chancellor, architect, &c., 25, Old Broad-street, London; and Chelmsford, Essex. Tenders to whom by the 18th January.

COVERED YARDS.

ESSEX.—For the erection of covered yards, at Tillingham Hall, Essex, for the Trustees of Dean Clarke's Charity. Drawings, &c., with Fred. Chancellor, architect, &c., 25, Old Broad-street, London; and Chelmsford, Essex. Tenders to whom by the 18th Jan.

DOCKS.

WORKINGTON.—For the construction of a wet dock for the Right Hon. the Earl of Lonsdale, at Workington, Cumberland. Specifications, &c., at the offices of Messrs. Lumb and Howson, solicitors, Whitehaven; or of Mr. A. M. Rendel, C. E., 8, Great George-street, Westminster. Sealed tenders, endorsed, "Tender for Workington Dock," Messrs. Lumb and Howson, Solicitors, Whitehaven, on or before the 28th January.

FARM BUILDINGS.

DEVON.—For the erection of a new farm house, at Halscombe, near Ide. Plans, &c., at Messrs. Daw and Son's offices, solicitors, Bedford-circus, Exeter, where tenders must be forwarded by the 1st February.

MILITARY WORKS.

CORK.—For works of defence, including bomb-proof barracks, at Camden Fort, Cork Harbor, Time for tenders extended to January 22nd.

FLEETWOOD.—For tenders, in detail, for the erection of a two-gun wooden battery, at Fleetwood. Plans, &c., on application at the Coastguard Watch-house, Fleetwood. Further particulars to be obtained from Commander Chapman, R.N., Morecambe, to whom all correspondence is to be addressed, and with whom tenders are to be lodged by Saturday, January 11th.

PATENT SLIP.

HULL.—For a patent slip, not less in size and capacity than the largest of the existing slips at Kingston-upon-Hull, for the use of vessels frequenting the port, for the directors of the Dock Company. A statement of the conditions may be obtained upon application to the secretary, W. H. Hufham. Accompanying these conditions is a form of tender, upon which only tenders will be received. Tenders must be sent in on or before 12 noon, of the 18th January, addressed to the secretary.

SUPPLY.

KENT.—For the supply to the Trustees of the Wrotham and Maidstone roads, of the following materials in the undermentioned districts:—Surface-picked Flints. 1st District.—From Footscray Bridge to the 15th milestone, 200 yards, 2nd ditto—from the 15th to the 18th ditto, 150 do.; 3rd ditto—from the 18th to the 21st ditto, 200 do.; 4th ditto—from the 21st to the 25th ditto, 200 do.; 5th ditto—from the 25th to the 28th ditto, 200 do.; 6th ditto—from the 28th to the 30th ditto, 200 do.; 7th ditto—from the 30th to the 32nd ditto, 200 do.; 8th ditto—from the 32nd to the 34th ditto, 200 do. The materials to be deposited clean and unbroken on the side of the road at such places and times previous to the first day of November next, and in such quantities in the above districts as the surveyor shall direct, and to be laid in separate heaps containing a yard cube each. The form of tender may be had of the surveyor, Mr. John Collis, of Birling, or no other form of tender will be received. Sealed tenders, addressed to the Trustees, and marked "Tender for Materials," to be delivered at the Swan, in West Malling, on or before the twelve at noon of the 25th inst.

SALES AT GARRAWAY'S AND THE MART.

FREEHOLD.

By Messrs. E. Fox and Bousfield.
ST. GILES'S.—House, with shop, No. 10, High-street, St. Giles's, with cottage in the rear, the whole let on lease at £33 per annum; sold for £540.
House, with shop, No. 11, High-street, let on lease at £34 per annum; sold for £400.
House, with shop, No. 12, High-street, also four cottages in the rear, the whole let on lease at £30 per annum; sold for £700.

By Messrs. Hudson and Son.

WOOLWICH.—Residence, known as "Prospect House," Woolwich-common, let at £50 per annum; sold for £700.

By Mr. Marsh.

CLAPHAM.—Residence, No. 13, Stockwell-place, Clapham-road, let at £40 per annum; sold for £620.
Residence, No. 14, Stockwell-place, let at £45 per annum; sold for £700.

LEASEHOLD.

By Mr. Marsh.

CAMBERWELL.—Dwelling-house and shop and two residences, Nos. 4, 5, and 6, Alhion-place, Camberwell New-road, let at £116 per annum, term 97 years from 1845, ground-rent £13 per annum; sold for £920.
BUCKLERSBURY.—Warehouse and premises, No. 2, Bucklersbury, let at £278 per annum, term 14 years from March, 1860, ground-rent £160 per annum; sold for £150.

By Messrs. E. Fox and Bousfield.

WHITECHAPEL.—Four houses, Nos. 49 to 52, Great Prescott-street, Goodman's-fields, Whitechapel, with stabling and workshops in the rear, let at £120 per annum, term 61 years from Christmas, 1807, ground-rent £28; sold for £290.
HYDE-PARK.—Family residence, No. 7, Connaught-place-west, Hyde-park, held for 21 years from June, 1856, at £145 per annum; sold for £200.

By Messrs. Hudson and Son.

WOOLWICH.—Residence, 1, Nightingale-terrace, Woolwich, value £60 per annum, sold for £175; term unexpired 42 years.
Two residences, 2 and 3, Nightingale-terrace, value £90 per annum, ground-rent £8, term unexpired 44½ years; sold for £240.
Two similar houses, 4 and 5, Nightingale-terrace; sold for £240.
Two similar houses, 6 and 7, Nightingale-terrace; sold for £260.
8, 9, and 10, Nightingale-terrace, value £135 per annum, term unexpired 48 years, ground-rent £14; sold for £140.
Premises, Woolwich-common, let at £75 per annum, term unexpired 16½ years, ground-rent £12; sold for £590.
Stratford-house, Woolwich-common, value £50 per annum, term unexpired 9½ years, ground-rent £5 15s.; sold for £460.
Residence, adjoining above lot, let at £40 per annum; sold for £650.
Four houses, 3, 4, 5, and 6, Clarence-place, Woolwich, value £240 per annum; term unexpired 20 years, ground-rent £20; sold for £780.
Six houses, 1 to 6, Queen's-terrace, Woolwich, let at £400 per annum, term 30 years, ground-rent £27 11s.; sold for £1,170.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favor us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

E. F. L. (Northampton.)—Shall appear; we could reply more satisfactorily if we were to see sketch.

K.—By hot water. There are so many good makers that it would be difficult to name one as the best.

H. B. L. (Tavistock-street.)—We do not know.

S. T. N.—Will probably see a reply in our next.

B.—We cannot refer.

T. D.—We cannot appoint a time, but will take our chance.

C. R.—Complaints often reach us on the subject; write to the secretaries.

L.—We shall be glad to see promised sketches.

B. B. B.—In our next.

MR. GEORGE C.—Report will be given.

F. E. W.—Try again.

S. AND J.—Below our mark.

M. P.—Thanks; shall be made use of.

T. W. T. (Euston-road.)—Received.

C. X.—We cannot comply with such requests.

A.—Particulars have not reached us.

G. M.—Send extract from conditions.

T. R.—Yes.

L. O. L.—Not fairly stated.

INDEX TO VOL. VII.—The Index and Title Page to the past volume will be issued with our next number.

THE CHAMBERS' SUPPLEMENT.—In answer to several correspondents, the remainder of the "Chambers' Supplement" will be printed as soon as the plates can be prepared, and will then be presented to subscribers; thus enabling them, in compliance with a generally-expressed desire, to complete the work at once.

* * * All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Bow-church-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 15 to 21, Old Bow-church-court.

THE YEAR'S PROGRESS.*

THE circumstances connected with the curatorship of the Soane Museum is another instance of the evils resulting from lack of professional organisation. Into the qualifications of the candidates we have no wish to inquire. It is sufficient to note that the gentleman at present holding the office is not an architect, and that his professional achievements do not satisfy the requirements of the Act of Parliament. The result of the imbroglio is the resignation of two of the trustees, and a proposition to apply to the Legislature for fresh powers, which may end in the collection being sent to South Kensington, or made more accessible to the public than it is—a result which, in the interest of artistic study, we should welcome. Again, the cool way in which architects were shelved by the Commissioners of the International Exhibition deciding to “have nothing

to do with them,” may be traceable to the same source. On the merits of the building there is no occasion to speak; they cannot be fairly judged until the structure be complete. But this we may be permitted to say, that had architects been allowed the opportunity, there is no reason to suppose that they would have been unable to supply designs quite as meritorious, from an architectural point of view, as Captain Pownke's, and quite as cheap in construction. If eminent architects led the Commissioners into a dilemma last time, which we deny, they should have been afforded an occasion to repair their error. It would have been gracious to have made this concession. But the cause of the dilemma did not reside with architects; it was with the Commissioners themselves, who did not know their own minds, or, at all events, did not know what was required. From the novelty of the thing their ignorance was quite excusable. Had it been otherwise, and the Commissioners been able to say “we require a temporary structure, covering so much superficial area, and affording so much wall-space, the whole not to exceed a certain amount for cost,” it is ridiculous to insinuate that architects could not have designed a monster greenhouse just as well as Sir Joseph Paxton did. On the present occasion we do not complain of the Commissioners having obtruded an officer of Royal Engineers on the profession. On the contrary we desire access to it to be as free as possible. But we do complain that architects should not have been allowed to compete with this gentleman for designing a national edifice—one which foreigners will not unnaturally regard as the standard of constructional skill and æsthetic capacity possessed by British architects of the present day.

If we turn from the social position of architects to their works the prospect will be infinitely more cheering. A general view must satisfy the least favorably disposed towards the profession that there is a steady and very marked progress in the constructional and artistic character of recent buildings. We do not say all are good, nor do we seek to deny that errors have been perpetrated, often springing from a striving after originality, but we do contend that on every side there is evidence of more thought, of more serious study, and of a greater desire to build honestly than existed formerly, or are to be found among contemporaries abroad. In the provinces, but more particularly in Lancashire and Yorkshire, the revival of study and conscientious construction are quite as remarkable as in the capital. In Manchester, Liverpool, Edinburgh, Glasgow, Dublin, Newcastle, Leeds, Halifax, Hull, and other towns, structures are arising highly creditable to the age, and which, on the Continent, would be regarded as architectural monuments.

Judged by the works they have been commissioned to execute, Gothicists would not appear to have experienced any diminution of public favor; the check they may have suffered with respect to the Foreign Office has been compensated in other ways. We may sympathise with the architect, under his annoyances, and some may even go to the extent of regretting that he should have condescended to design, “for God's sake! something Italian,” but the pressure put upon him proceeded from individual taste, and is liable to be removed at any time—even before the foundations are laid, by the play of political parties. Nor are the Medievalists altogether devoid of hope that the presence of

Mr. Layard in the Ministry may lead to modifications which may end in a return to Mr. Scott's original design, or in the structure being gradually Gothicised, as it is developed. Of late there has been a noticeable tendency to forsake servile copyism of Gothic examples, and, instead, to work in a Gothic spirit, with greater freedom, in view to employ unhesitatingly, and as liberally as may be consistent with artistic propriety, modern appliances to satisfy modern requirements.

The stronghold of Gothicists has been in ecclesiastical edifices, of which the most remarkable are the churches and restorations of Mr. Scott, Mr. Street, and Mr. Butterfield. One of the earliest attempts, if not the first, to introduce the Italian, or polychromatic, element into English Gothic has been nearly completed by the restoration of All Saints', Kensington, which was commenced ten years ago or more. Here the original architect introduced red voussoirs in exterior arches, mosaics in spandrels, and made the columns of Devon and Cornish marble. The pulpit is of Derbyshire alabaster, Cornish marble, and Irish black marble. The seats are open and stained, while color and gilding have been introduced in the reredos. The pavement is composed of colored quarries; and horizontal bands of the same material, black, red, and yellow, are carried round the lower part of the walls up to a height of about 6 feet. Mr. Street's church in Westminster is an admirable example of the architect's taste and skill, and is remarkable for what many will regard as his happy innovations. The material of the walls both external and internal is common red brick. The architect has relied more than usual on polychromy for effect, and on the aid of sculpture and painting. What is certainly a novelty, and must create doubts of the architect's orthodoxy in the minds of advocates of parochial whitewash, is Mr. Watt's truly noble fresco which decorates the east wall of the nave, and is a greater work of art than his fresco in Lincoln's-inn. Sculptured medallions are introduced in appropriate positions. The columns dividing the nave from the aisles are of polished red granite with carved capitals, illustrating the miracles and parables. The roof is boarded between the arched ribs are elaborately decorated with designs in color. Another novelty is the decoration of the apse with figures incised in stone, filled in with black cement, while the pulpit, if taken by itself, would be considered as a highly creditable piece of sculpture, carefully designed, and wrought ironwork is employed as screens. Mr. Butterfield's church in Baldwin's-gardens is scarcely sufficiently advanced for us to speak of it in detail. Superior to Margaret-street church in general design, perhaps, it will not be inferior in the richness and elaborate decoration of the interior. The materials of the walls are the common yellow bricks, but for the decoration of the interior alabaster and colored marbles are to be employed, as well as a series of frescoes. These are the two chief features of progress in ecclesiastical architecture during the year (besides Mr. Scott's cathedral restorations), which indicate a stride forward in a direction the people of England have not hitherto witnessed. Elsewhere in the metropolis and the provinces churches and chapels have been erected, which we regret our want of space precludes us from noticing. They will be found set forth in the volume just ended.

The new room to the National Gallery is an improvement, but can be regarded in no other light than as a costly makeshift. A Turner gallery has to be built, which Mr. Pennemorne proposes to do, and at the same time to supply additional accommodation to the National Gallery by building a suite of rooms at the back, over part of the workhouse site and the barrack-yard, at a cost of £100,000. The structure is to be devoid of architectural character and ornament, and will supply an area of 30,000 square feet. But seeing the rate of increase of the national collection of pictures, it will not be many years before the new excrecent edifice will be filled to repletion, and a fresh offshoot, equally devoid of architectural character rendered necessary. What is to be done with the British Museum?—is a question that has been repeatedly asked, without eliciting a reply. It is rumoured that the separation of the natural history collections from the rest is to be effected; but where they are to go yet remains a question.

The buildings of the Horticultural Society exhibit in a fresh and agreeable manner the resources of Italian architecture; and in the monster hotels that are springing up in connexion with railway termini architects have found admirable opportunities for displaying their skill in dealing with large street façades. The task is not easy to execute; and with the exception of the Grosvenor Hotel, there is not one which an architectural critic would be inclined to regard as possessed of high artistic merits. They may be honestly built, and well planned, but they are not in all respects satisfactory works of art.

Having so recently described at length the metropolitan improvements designed or in the course of being carried out, the arterial drainage works, new thoroughfares, markets, bridges, and railways, we may be permitted to omit further notice of them here. But we cannot refrain from congratulating all parties concerned in building operations on the apparent termination of those unhappy strikes, which have done

* Continued from page 29.

nothing but mischief, and would lead to the belief of unconquerable ill-feeling existing between masters and men. It is, however, some consolation to learn that during the last decade the census reveals the fact, if it were not known from other quarters, that the building trades have had their fair share of prosperity. In England we have built, or are building, 523,835 new houses, which is doubly satisfactory, as affording proofs of the activity of the building trades, and of the increasing well-being of the community at large.

CHURCH RESTORATION.

IT is not often the case that those who are habitually engaged on practical works, and can carry them out in the best way, can equally well write about them or describe them. To take only a single instance, George Stephenson, the father of our railway system, though one of the most inventive and skilful engineers the world has ever seen since mechanics first became a science, was one of the worst possible witnesses, and his friends never offered his evidence without reluctance. It is, therefore, of peculiar value to obtain the opinions on a practical subject of a practical man, who unites to technical skill the ability to write and speak well.

On this ground, the paper of Mr. Scott, "On the Conservation of Ancient Buildings," published in our columns, possesses a value of no ordinary kind. Few men, if any, have been so extensively employed in the work of protecting and preserving ancient buildings, and few architects could be found so capable of conveying to others the impressions made on their own minds by their experience of that or any other professional engagement.

We are, therefore, justified in supposing that Mr. Scott's paper will be almost universally read, and read with great attention, and that consequently the subject of it will be likely to be just now very extensively under the notice of our readers. This being so, now is the proper time for any observations of our own, on the whole question or on any portions of it.

Church restoration is by no means the same thing as the conservation of ancient buildings; but it is a part, and a very important part, of that comprehensive subject; and more commonly brought under notice than any other sort of preservative or restorative work. We propose, therefore, to limit what we have to say in this article to works done upon that one class of ancient buildings which includes ancient churches and chapels, without noticing either cathedrals on the one hand, or domestic, antiquarian, or monumental objects of architecture on the other.

The word restoration is an unfortunate one. "I could almost wish," says Mr. Scott, "the word *restoration* expunged from our architectural vocabulary, and that we could be content with the more commonplace term *reparation*." This is most true. It is too often the case that those engaged in directing the works on an old church, conceive it to be their duty to bring it back if they can to the condition in which they consider it was left when first built,—or what is worse to bring it to a condition such as it might have occupied at some time or other, had certain ideas which they suppose to have been among the intentions of the first architect been carried out.

Many other examples of extravagant interpretation of the word "restoration," might be adduced. In putting our own interpretation on the word, we will take it in a very conventional sense. We will for the present quite ignore any more distinct signification of the word than that which every builder, and almost every architect, attributes to it, that is, the works which it has become at the present day customary to undertake, in order to remedy the long neglect and misuse to which most ancient churches have been subject—and often also in order to enlarge or improve them, to meet such modern requirements as want of space, want of warmth, want of comfort, and the like.

Such works are going on now, on all hands, for a vast amount of zeal and liberality has wakened up to a sense of the disgrace which attaches to those who live themselves in splendid dwellings, and allow the house of God to fall into ruin. Few architects are without some work of this nature, and many have had numbers of such "restorations" within a very few years entrusted to them, and it is therefore of the highest importance that as these works badly directed will be peculiarly injurious, they should be carried on in a right spirit.

As a work of art, and, at the same time, a work of local history, an ancient church has a value second to no other work either of art or skill which this country contains, and they who have the care of it have the responsibility of being public guardians of most valuable property. Destroy its antiquity, and its greatest value is lost; replace it with a copy, and you perform an act as directly of public robbery as if you were to cut to pieces the pictures of the National Gallery, and leave copies in their place on the walls. Carelessly or thoughtlessly replace broken fragments, or supply missing links, and you perhaps procure for your own careless work the reputation of being ancient, and thus damage the reputation of others, unknown now by name, it is true, but not on that account unworthy of renown, whose art was older and nobler than yours; or else you bring really ancient work into doubt, or even into disrepute, through your association of your own with it.

There can be no doubt that very extensive works are necessary to churches, and always have been; but it is quite certain that such works as were undertaken down to the sixteenth century have seldom left much to regret, while those done after that day have produced the evil result we have above referred to, or in some other way have been equally re-

grettable. Why is this? What did the fathers do in their works of addition or reparation, or rebuilding, which we, their children, have failed in many cases to do in our turn?

What they did was simply this, they built always in a style suitable to Ecclesiastical buildings, but always also in a style of their own, and these we believe to be the true principles upon which all additional works to be done to churches should be executed.

The men of the seventeenth and eighteenth centuries acted upon one only of these principles—they always worked in their own style, and we ought so far to thank them for it. It is true that most of their work was entirely unsuitable to the character of the buildings, eminently inappropriate to churches, and as such we remove it, and regret that in many cases it has permanently disfigured the church. But in no instance will even an ordinary observer mistake an addition of the last century for an original portion of the fabric; and, this being so, we suspect that a right-minded man will, in nine cases out of ten, be more grateful to the men of that century, clumsy and barbarous as some of their church alterations were, than to us. We have in countless instances replaced really fine old fragments by work which, though it may perhaps claim to be in some small degree more appropriate, has no distinctive character of its own; work which, inferior in value to the original, both as being a copy, and also usually as being an inaccurate copy, is yet sufficiently close an imitation of it to occasion difficulty to those who desire to refer to the really genuine work in the church.

What we desire here, then, to urge is, not a mere repetition of what Mr. Scott has so well and so clearly urged, as to the necessity of intelligence and care in copying mouldings, and in supplying lacunæ in tracery, of abstinence from attempts to restore carving, and of an almost superstitious anxiety to preserve genuine portions of antiquity; we are content to leave that as he put it. But restoration works, as we have defined their meaning, do ordinarily imply the re-introduction of some features, as, for example, new seating or other furniture, sometimes renewed portions of the existing fabric, and very often fresh features; and we do urge that, as far as possible, these shall be so done as to show at once, and to all time, that they are unquestionably nineteenth-century work and none other.

This, a few years ago, would not have been even so practicable as it is now; and, at the present moment, is not so practicable as it will be some few years hence. But we maintain that it is right in principle, and not only so, but that it has now become to a very great extent practicable in execution.

It is not necessary to repeat here what has been said so often in this Journal, as to the reality of an existing style of architecture. Take the most recent works of our best men, and we find in them a strongly marked amount of coincidence and similarity sufficient to denote them as all belonging to one school, and yet a variety enough to mark them clearly as the works of original artists. At the same time they are such works as, in their general characteristics, stand quite apart from all previous time, and as will be at once referred by the antiquaries of future ages to this particular period of architectural history. Here, then, we have contemporary architectural character, and it is this character that we desire to see impressed on all our addition to, or alterations in, existing buildings.

It will always be easy, and always desirable to preserve general congruity or balance of general features, harmony and outline, and so forth, just as the later Gothic builders did in their additions to original edifices; but it will not be on that account necessary to make believe that the new tower or the fresh porch, or the additional aisle we add was done at the same time as the rest of the building. Such a make-believe is not satisfactory, where it is transparent and consequently easily detected; it is unfair and deceptive where it is carried to such an extent as really to mislead.

Notwithstanding this, it does not necessarily hold good that every fragment replaced, shall be replaced by something essentially different. Where there exists an amount of decay such as renders necessary the renewal of a portion or portions of old work, it may be right if practicable to replace it with a close copy; but we are persuaded, that where a close copy is not practicable, no copy ought to be attempted. The most respectful course no doubt is to leave the stone unwrought, replacing carving by blocks left uncut, and mouldings by stones prepared for moulding only; but where this may not be, and copying is not of the simplest sort, let good and confessedly modern work be introduced, the best but the least ostentatious possible.

The subject is a seductive one; we cannot, however, now pursue it further than to remark that the architect of a church restoration should make it a labor of love. Over and above the ordinary care, for which he is paid, he should devote to each work of this sort care and pains purely for the sake of art; and should think himself well repaid for even a considerable sacrifice of time and trouble, if he do but succeed in preserving one or two genuine ancient features from loss, mutilation, or disguise, and in limiting the amount of new work introduced to the most modest quantity possible.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL General meeting of members only, was held on Monday evening, to receive a report from the Council, on Professional Practice and charges. As it was requested that the discussion should be considered to be of a purely private and confidential nature, we abstain from any notice of a very important meeting. But we may say that the Council deserve the thanks of the entire profession for the production of the report laid before the members.

The meeting was adjourned for the further consideration of the subject.

THE UTILISATION OF LONDON SEWAGE.

INTIMATELY connected with the health and welfare of the inhabitants of large towns is the disposal of sewage, and no false delicacy should be allowed to prevent its study as a question of the highest sanitary and economical importance. The action to which food is subjected, after it has been eaten, has been truthfully compared to that of a furnace. It is consumed in the stomachs of animals, and the refuse disjected is, therefore, the ashes of food. But these ashes are different from those produced by coal or wood fires, inasmuch as they contain the essences of fertility—that is to say, the means for reproduction of fuel for the stomach. We may return cinders and wood ashes to the soil—not that we deny their manurial value—but they will not reappear in the shape of coal or trees; whereas the ashes of food, restored to the soil, are taken up by grasses, vegetables, and cereals, to be transmuted by the recuperative processes of nature into food again, so that nothing is lost. The growth of crops, their consumption, and the return of their ashes to the soil which has been sown or planted afresh, are a regular cycle of processes, no one of which can be omitted without stopping the others. If food be cropped off the land and its ashes not returned in the shape of manures, the soil is exhausted and rendered incapable of again producing food. In England we are placed in an abnormal and costly condition by the erroneous manner in which the sewage of centres of population has been disposed of—or, to be more exact, we should say wasted. Of the enormous quantities of food grown and imported here an infinitesimal quantity finds its way back to the soil. It is stored in cesspools until it loses its most fertilising property, nitrogen, which is evolved in the shape of ammoniacal and other gases, and discharged into the atmosphere, to breed disease, or it is discharged into our streams and rivers, to poison the water we drink. To remedy this wilful waste we are compelled to import guano, bones, coprolites, and other manures, at a cost of several millions annually, while we are obliged to pay a further penalty in the shape of sewer rates for unproductive sewerage works.

What is the money value of this annual waste? Liebig says the price of nitrogen alone produced by every 100,000 persons is £12,000 a year, and would suffice to manure 50,000 acres of wheat land with the accompanying phosphates, alkaline and neutral salts, and organic matter. Mr. Edwin Chadwick asserts the yearly value of disjecta is £1 17s. per head. According to Professor Johnson the annual value of fluid disjecta for every 100,000 of population is £223,000; while Mr. Lawes estimates at 6s. a year the actual value of the chemical constituents of the dry substance of disjecta per head, leaving the more valuable fluids out of the question. For the sake of round numbers, we will take the population of the three Kingdoms at 29,000,000, though it is more, and will soon be 30,000,000 with the rapid decline of emigration consequent on the civil war across the Atlantic. Then, according to Liebig, the annual value of nitrogen alone, produced by the entire population, will be £3,480,000, and would suffice to manure fourteen millions and a half of acres of wheat land. Mr. Chadwick's estimate, based on practical observations in Belgium, shows the yearly worth of the total disjecta to be £53,450,000. Professor Johnson makes the value of the fluid disjecta £4,670,000, and Mr. Lawes gives the worth of the chemical constituents of the dry substance at £8,700,000. Taking the highest estimate, it will be seen that we annually waste a sum nearly equal to the total amount of revenue raised by taxation, while, according to the lowest estimate, the waste equals the amount produced by the income tax. To put the question in another form, if Mr. Gladstone were invested with the monopoly of disposing of our refuse, its present market value would enable him, if he utilised the fluids, to abolish customs' excise and all other taxes, with the exception of four or five millions; and, if he limited himself to the constituents of the dry substance, he might in his next financial statement announce the abolition of the income and property tax.

Although the Chinese manage to return nearly the whole of the ashes of their food to the soil, it may be argued that we should experience too great a difficulty to collect the disjecta of small centres of population. Admitting the validity of the objection, we reply that, according to the last census, there are 36 towns, with their respective populations above 50,000, whose aggregate populations are 7,395,601. The objection cannot, therefore, apply to them. And the highest estimate would make the annual value, in round numbers, of their disjecta £16,500,000, and the lowest estimate would fix it at £2,218,680.

In the case of the metropolis, where the whole will be shortly collected, Professor Johnson's figures show the annual value of the disjecta is £6,250,000, and Mr. Lawes's, that it is £841,210. To this again must be added the value of the manurial substances carried down by rainfall into the sewer. The droppings from cattle, and pulverised granite from the pavements are of considerable value. Professor Way stated in his report that,—"So far as London is concerned, and considering only the composition of the liquid which reaches the sewers in the time of rain from the streets, it seems pretty certain that it would be as valuable in a manuring point of view, as the ordinary contents of sewers."

It should be remembered that the figures and estimates quoted are the results of investigations of the subject by the most eminent chemists and agriculturists of the day, and are not put forward by speculators or the concoctors of joint stock companies. They are the calm, well digested, and carefully matured conclusions of science. Indeed, there has never been a question as to the value of the constituents of sewage. Their quantity and character can be accurately estimated, and as they are similar to the constituents of manures which are sold daily, their market value is easily determinable. The only question, and which is the cause of the discrepancies in the figures quoted, is as to the extent to which the manurial

constituents can be recovered. If the whole of the sewage is applied to the irrigation of soil, then the highest estimates will represent the minimum economy, but, if only the chemical constituents of dry substances are applied as manure, then the lower estimate will represent the amount of annual saving. Consequently, when the arterial drainage of London is completed, it will collect and discharge manure of the value of six millions and a quarter every year; and the question now raised is whether these millions shall be discharged into the Thames to waste, or rather to be brought back by the flow tide to breed a pestilence in the midst of us, or whether it shall be discharged on to the soil to increase its fertility.

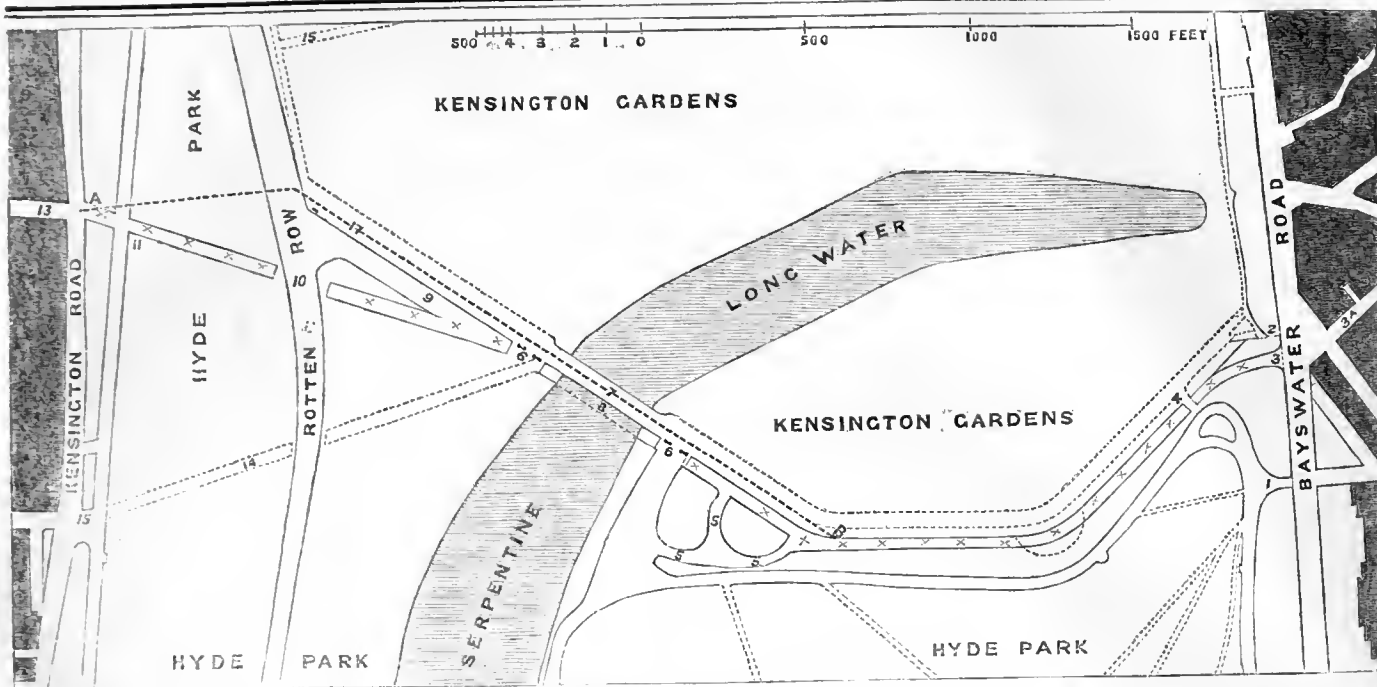

A proposition has been submitted to the Metropolitan Board of Works for applying the entire dry weather sewage of the northern area of the metropolis to the fertilisation of lands to be reclaimed on the Essex coast. For this purpose an area of 20,000 acres on the Foulness Sands and Dengie Flats is proposed to be enclosed from the sea. A brick culvert 10 feet in diameter is to be constructed from the main intercepting sewers at Abbey Mills pumping station to the river Crouch, a distance of 37 miles. From this point two open branch sewers, seven and eight miles in length respectively, are to be built to convey the sewage on to the reclaimed lands. In the line of the brick culvert—at about the ninth mile from Abbey Mill—are to be a lift of 30 feet, and a pumping-engine of 1,200 horse power. Arrangements are to be made for distributing portions of the sewage to farms along the line of the culvert at such distances from the centres of population as to create no nuisance to them. The surface soil of the areas to be reclaimed and irrigated with sewage, consists chiefly of an admixture of sea sands and fluvial silts. It is not deemed necessary to provide subsoil drainage, but merely to place a catch drain inside the line of embankment to retain the surplus water from sewage after irrigation, for discharge into the sea through ordinary sluice valves. The estimated cost of the works is £2,000,000. The advantages of the scheme, besides the great and cardinal one of utilising sewage, are saving the expense of deodorisation which the Board would have to incur in hot weather, and diverting sewage from the Thames, so as to prevent all chance of its being brought back by the flow into the centre of the metropolis. What would be the cost of deodorisation we have no data for estimating, but that it would be considerable and a permanent heavy charge upon ratepayers we may be certain. Equally sure may we be that, if the sewage is discharged into the Thames at Sea-reach, it will, in the course of time, be carried back above bridge by the tides, to form mud-banks, and perpetuate the nuisance we shall have spent millions on arterial drainage to get rid of. The proof that such will be the case will be found in the fact that the salt constituents of the sea are carried up so far as to furnish traces of brackishness at Battersea. The evidence of Mr. Goldsworthy Gurney, in his report on the state of the Thames, supplies additional proof that such would be the case in consequence of the superior power of the upcast over the down. He cited the example of sea sand carried fourteen miles up the Cornish tidal river, Camel, against the freshest. Lastly, it is something to add 20,000 acres of food-producing soil to the area of England. As to the practical and engineering merits of the scheme, we have the authoritative conclusions of Mr. Bazalgette that—

The tract selected appears to be well adapted to the reception of the sewage, and is, indeed, the only one yet suggested to the Board, where, from its position, extent, and nature of its soil, there would be a reasonable prospect of its receiving advantageously so large and constant a discharge of sewage, without creating a nuisance to the surrounding district. That the works have been carefully considered and well designed, and the estimate is fair and sufficient, and that the proposition is the only one the promoters of which have, by depositing plans, placed themselves in a position to carry out during the coming session of Parliament, and so far as its engineering character and details are concerned, it is thoroughly practical, and deserves the favorable consideration of the Board.

Let us now glance at the advantages which would result to the ratepayers from the adoption of the scheme. The Board of Works are to grant to the promoters an absolute and exclusive property in the Northern sewage for fifty years, in return for which they are to share equally with the promoters the net profits after 10 per cent. has been paid upon the capital, and in the profits from the sale of reclaimed lands, after deducting the dividend and cost of the works. The Board are further to be empowered to purchase the works at the expiration of the lease, on giving seven years' notice, at a fair valuation, and to appoint two Directors to the Board of the promoters' Company. What pecuniary gain would accrue to the ratepayers there may be some difficulty in accurately determining; but, from experience elsewhere, we can make a tolerably fair guess. To pay 10 per cent. dividend on capital would require £200,000. The poorest portion of Craigentinny farm, irrigated with Edinburgh sewage, gives an average yearly rental of £18 an acre. Accepting this as data—and that the rental would be much higher, will be evident when it is remembered that the prices for agricultural produce rule much higher in the London than in the Edinburgh markets—the reclaimed estate on the Essex coast would yield a rental of £360,000. If we deduct the dividend there will remain £160,000 for working expenses and for division between the Board of Works and the promoters. The working expenses are not stated, but we shall probably not be very wide of the mark in estimating at £50,000 the Board's share of the profits if the above provisions be realised. Do the ratepayers deem it worth while to run a chance of earning this amount without incurring any pecuniary risk or liability whatsoever; for that is the real question at issue?

The sum which the Board of Works "stand to win" would enable them to reduce the rates they levy by nearly one-half. Is this of no importance to the heavily-burdened ratepayers of the metropolis?

When the motion to accept the proposal of the promoters was brought before the Board by gentlemen from whom it was our misfortune to differ on previous occasions, and on this very subject, it was postponed for a month by a division of 17 to 13 on the most futile pretexts. One was to

PLAN OF SUGGESTED LINE OF ROAD ACROSS HYDE PARK.

References to Plan:—

- | | | |
|--|--|--|
| <p>1. Victoria-gate.
2. Buck-hill-gate, with entrance as at present.
3A. Westbourne-street.
3. Entrance to Proposed New Road from the Bayswater-road, and opposite to Westbourne-street.
4. New entrance to Kensington-gardens, over proposed new roadway, avoiding thereby the necessity of crossing it on the same level. Between the points 3 and 4 there is an existing difference of 13 feet in the actual levels.
5,5,5. Suggested development of Park carriage communication with the Kensington side of the Serpentine.
6,6. Tunnels on either side of bridge, so as not to interfere with the present entrances to the Gardens.
7. Bridge across the Serpentine, the proposed roadway to be carried underneath it and through piers of arches; the surface of road being 4 feet below level of water.</p> | <p>8. Site for a temporary bridge of boats during the Exhibition period, as there would not be time to finish openings through the bridge.
9. Development of communication between Rotten-row, with the Kensington-road, and which the passage of the proposed new road offers.
10. Tunnel under Rotten-row.
11. Development of Park carriage communication with those existing on the Bayswater side of the Serpentine.</p> | <p>13. Exhibition-road.
14. Line from bridge suggested before the Exhibition-road was formed.
15. Prince's-gate.
16. Broadwalk through the centre of Kensington-gardens.
17. Platform for band.
N.B.—The dotted line from A to B suggests by a subway an additional means of more removing the road from public view. This suggestion would, however, lead to greater expenditure.</p> |

SUGGESTED LINE OF ROAD ACROSS HYDE-PARK.

Seeing that credit is being given to others for the suggestion, Mr. Harry R. Newton claims to be the original proposer of an open sunk road, following the line of division between Hyde-park and Kensington-gardens, and forming a channel of communication between Bayswater and the surrounding neighbourhood, and Kensington. The drawings (from which the plan given above has been reduced) were, it appears, prepared in the early part of 1856, and on several occasions since that time the author has urged the desirability of arrangements being entered into between the Government and the parishes for its formation.

The following among suggestions relating to the proposed road, which is to be sunk below the general level of the park and gardens, will explain the author's intentions.

A. That as it is important to have a road at once, on account of the International Exhibition, that it would temporarily relieve the financial difficulty to the parishes, Exhibition authorities and others, if the road were opened at first only for day traffic, the parishes, &c., being enabled to open it for night traffic, as soon as the means could be found for railing the road off and providing the lighting it with gas.

B. That for the present urgency, a bridge of boats across the Serpentine, on a level with the intended road, offers a momentary alternative and admits of delay for considering maturely the difficulty of passing the Serpentine.

C. That as the public traffic along the intended road would not be "heavy traffic," it ought to be considered as much for a development to the Park as a public road, so as to render carriage communication between existing park roads on the two sides of Serpentine complete in their circuit.

D. That the foregoing would induce economy of expenditure at the junction of the intended road with the Kensington-road, as at any future and probably remote time, and when the public traffic had increased, the road proposed could then as easily as now, be separated from the Park altogether at that point.

E. That the intended road offers an opportunity for developing the communication between Rotten-row and the Kensington-road, greatly to the convenience of the equestrians, and for considering, as the park and gardens at the junction of the bridge are so crowded, at various and uncertain times, by pedestrians of all ages, whether the route for equestrians now across the bridge, might be diverted into the intended new roadway.

G. That the carrying the road through the piers of the bridge is believed to be the cheapest mode of passing the Serpentine, for preserving the circulation of the water, and for the concealment of the road from the general view, so as not to interfere with the appearance through the arches, obtaining this by keeping the surface of the roadway some 4 feet below the water level, but as even this would form a considerable item of expense, that it might be a question to consider, whether with but little addition to a sum so required, a fund would not exist sufficient to enable the bridge to be widened, carrying the public road through the piers of new part, thus obtaining increased communication on two levels, the lower one for the public traffic, and the upper one for the park. If,

FIRST CITY OF LONDON ENGINEER CORPS.

ENCOURAGED apparently by the remark of Sir J. Fox Burgoyne that "no body of volunteers can be more likely to turn to useful account in case of being brought into the field against an enemy than one organised as Engineers," the promoters of the City of London Engineers are forming a corps to supplement the regular forces of war, and effect the destruction or formation of railways, bridges, roads, and works of defence. The corps is to be composed of architects, civil and mechanical engineers, builders, artisans, and other scientific persons, and we believe there are many in London of these professions and trades who will join such a corps, if only on account of a course of instruction in military engineering, which will be immediately entered upon by the commanding officer Lieut.-Col. H. G. Man.

It is noticed as being remarkable that the City of London which has contributed so largely to the volunteer forces should, until recently, have been deficient as regards volunteer engineers, while other large towns have such corps.

We understand that her Majesty has been pleased to accept the services of the 1st City of London Engineers. Facilities are offered for the accession of artizan members. The head-quarters of the corps are at Church-court-chambers, Old Jewry.

THE QUEEN RAILWAY HOTEL, CHESTER.—MR. T. M. PENSON, ARCHITECT.

therefore, this were thought a park development, perhaps the Government might consider it was justified in providing the means, not for the lower roadway but for widening the bridge.

H. If this public route is at all considered objectionable, on account of noise, dust, &c., at certainly the most pleasant part of the park and gardens, another route is indicated for carrying a subway from A to B on plan, under the broad walk on either side of the bridge and through the piers of the bridge, but though all possible inconvenience would thereby be removed, the adoption of this suggestion would be attended with increased expenditure.

ON THE CONSERVATION OF ANCIENT ARCHITECTURAL MONUMENTS AND REMAINS.*

AND what is the state of the restored church? The external stonework is in good repair, but the antiquity of its details is dubious. The windows are of nice chronological accordance, but they fail to tell the church's history. The internal stonework has thrown off its coating of whitewash, but it has been re-worked, and all the toolmarks of the old masons scraped off by the unplying drag, or chipped away and replaced by modern toolings; the plastering is done to perfection, but it projects in strange unnatural notchings round the stone dressings, and has replaced what was a storehouse of the relics of decorative painting; the roofs are of sound oak, or display all the smartness of stain and varnish, but the old timber-work we valued is gone, and what now appears is not even like it; the floor is, perhaps, of the uniform neatness of a Staffordshire farmer's kitchen, or, it may be, displays all the glories of encaustic tile; but the memorials of the dead have perished, and the works of Mr. Minton (to which they have fallen victims) have scornfully ousted those of his teachers, while the local patterns of old times have given way to those which one now finds stereotyped from end of the country to the other. The windows are nicely glazed with cathedral glass, and some of them with stained glass of reasonable merit, but the one has thrust out the fragments of ancient glass-painting, while the other has scorned all endeavor to follow out and take example from their designs. The bells have been capitally recast by Mears and Warner, and their tones are, no doubt, musical; but if you go up to look at them, you find the ancient fretted border replaced by some vulgar headings, and the pious and beautifully lettered legend by the names of the founders and the churchwardens in lettering which would do honor to a haberdasher's shop.

This is a fair statement of an average church restoration; but there are many worse, as well as many better cases. The great majority, I grieve to say, are very far worse. We find in some of them reckless and often ignorant and senseless destruction of old work, united with an intense want of feeling in all that is done anew; so that the church has become equally sickening from what it has lost and what it has gained.

In others, again, we find an *utter blank* of interest—a church reduced to a state of unredeemed lukewarmness. I have recently been especially struck, in making a little tour, with the prevalence of this last-named type among restored churches: a nauseating blank,—neither anything interesting left, nor anything good introduced; and yet I was self-condemned at considering that the process, viewed as a whole, was much the same as that we are all in the habit of applying in our restorations, the chief difference lying in the degree of conservative feeling and of artistic skill with which it is applied. My great perplexity is to decide whether our entire system should be reconsidered and altered, or whether the whole question is one of details and of individual cases, each to be decided on its own merits.

Now let us consider for a moment what *should* be the bean-ideal of a restored church.

First, of all, we should have all its structural dilapidations so far repaired as to secure it against actual danger, and to insure its stability.

The external stonework would be so far repaired as is necessary to bring out the architectural forms where seriously decayed and mutilated, and to render the structure of the walls sound and durable. This would be done, not on a *wholesale* principle such as could be described in a specification, but in a *tentative and gradual* manner: first, replacing the stones which are *entirely* decayed, and rather *feeling one's way*, and *trying how little will do*, than going on any bold system. Every new stone will thus be a perfect transcript of that which it replaces, and this will, so far as possible, extend to its dimensions and the mode of workmanship, for there is a character even in the proportions of ashlar stones,—still more in the mode of working them. Where a part is wholly or in any great degree wanting, it is questionable whether it would be supplied beyond the extent of existing evidence; when later features have been interpolated, it is yet more questionable whether they would be removed. Such questions must depend upon circumstances, such as the merits of the original and of the interpolation, and upon the question whether the latter is in a state to demand thorough reparation, and whether the original features preponderate and give their character to the building. Such questions, too, would have been entered upon with a strong leaning against alteration; and this would show itself clearly in the result.

The interior would, it is true, be divested of its whitewash; but where this would not come off by fair means it will be more or less left on, for a little discoloration of the stone is of infinitely less moment than the obliteration of the ancient tooling, so that in cleaning it *no hard tool must ever be brought to bear upon its surface*. Where the stonework had been colored or decorated in distemper, the traces of this would be preserved with a loving care, no matter how indistinct or fragmentary they may be.

The plastering may to some extent be renewed; but wherever the old coloring could be preserved portions of the plastering would be left, and the new would be, like the old, *thin*, and not projecting beyond the stone dressings. The roofs, if ancient, will have been studiously repaired, so as to preserve every fragment which can be made to do its duty, even though the roofs may not be of the original date or pitch.

The floor, though levelled and made free from damp, will retain all its monumental slabs in their true places, and the remainder will be made in a great degree subordinate to them, and of the material which, so far as can be ascertained, was before used, whether stone or tile. If old encaustic tiles remain, they will receive all due honor and protection, and new ones will be founded on their patterns.

The seating will probably be the carrying out of such parts of the old seating as may have remained, all old screens, &c., &c., being carefully preserved, and that in their own proper places. Where ancient features, as niches, &c., have been ruthlessly destroyed, they will have been carefully traced out, and either exposed to view and left to speak for themselves, or, if sufficient traces are left and fragments found (which is often the case) to warrant it, they will have been studiously and with religious accuracy restored to their original forms, no old part being disturbed, and every old fragment worked in.

The fragments of old stained glass would retain each its own place, and if new glass be introduced where such remains exist, it will be made to carry out the design which they suggest. In a word, the old church will, by a *studious and tentative* process, have been brought into a seemly state without any startling up of old weather-beaten surfaces, and without any loss of ancient or traditional character; while in such fittings or necessary features as there was no ancient guide for, it will be felt that the restorer united the ability to carry out the spirit of the old work with a desire to limit himself to the smallest possible sphere in the exercise of it.

This seems the true ideal; but, as I have before said, it is by no means easy, and often impossible, to realise it. The extent and intensity of the decay of the materials, the shattered condition of the walls, the extent of barbarous mutilations, and the necessity for enlargement or other practical alterations to meet present wants, all militate more or less against it; yet the ideal suggests the *spirit* in which the work ought to be undertaken, even when it can only be partially attained; and I fear that it is not by any means the spirit with which such works really are undertaken. On the contrary, it seems as if many promoters of restoration, and those they employ, laid themselves out to destroy interesting features, even when a general restoration is not carried out. I passed the other day through a village (Edinbridge, in Kent) where a few years before I had sketched a window of great peculiarity, such as I had only seen one other instance of; it was one whose tracery was arranged especially to give scope to a crucifixion in the stained glass. I went to look at it again, when, to my dismay, I found that it had been singled out from among all the windows in the church for destruction, and a window of the vulgarist form substituted? Again, in a church near Reading there were many beautiful remains of painted glass, of the beginning of the fourteenth century, in the heads of the window lights, which I took much trouble to get tracings of. The church was "restored," and they all disappeared.

The noble church of Cley-upon-Sea, in Norfolk, had, when I saw it three or four years back, an original roof of the fourteenth century; certainly much decayed. It has now, I hear, been replaced by one of the meanest and most contemptible kind, not having the smallest reference to its ancient type. Wherever old frescoes are found the clergy set themselves especially against them. In a church I was myself engaged upon in Cheshire, the whole walls were found covered with large figures and other decorations of a most interesting character. Their destruction was decreed. I interfered, and threatened the builder's foreman with dismissal if he carried out the sentence; but they cleverly allowed the question to go by default, and let them be destroyed by exposure to rain, while the roof was uncovered. In another place the gentleman who paid for the restoration set himself earnestly to preserve a most remarkable fresco; but, while his back was turned, a workman, supposed to be bribed by another parishioner, chiselled it off. Even at Eton College, where the walls above the stalls were found to be covered with two ranges of oil-paintings in the manner of the Flemish school of the fifteenth century, the Fellows of the college had one whole range chiselled off from each side of the chapel, and the other range concealed by canopies which had never existed on the old stalls. This act of Vandalism I saw myself being perpetrated. And so it is all through the country; the most interesting features of our old churches are being weeded out through the carelessness, the prejudices, or the deliberate barbarism of those who have to do with them. Nor can the architect in all instances prevent this. I have now a church in hand where, an enlargement being necessary, I had arranged it with special reference to preserving a curious fragment of extreme antiquity; but the builder, who could not conceive why so scrubby a bit should be retained, took it down, asking no questions, and, in spite of my earnest remonstrance, has gone on finding one bit after another of old work to be too far gone for retention, and has let the old wall-painting, for which the church was celebrated, perish from exposure; indeed (having no clerk of the works), I was obliged to threaten the builder with extreme severity to induce him to spare anything at all. The fact is, that unless one is always at the spot, or has there a representative imbued with the right feeling, there is little chance for a building when once any portion has to be rebuilt, and sometimes, I fear, when the architect is on the spot, he does much the same thing, and perhaps even avails himself of his proximity to press with the greater success his anti-conservative suggestions and arguments.

I will here offer a few suggestions which may possibly be of some utility.

First, I have found it in some degree useful to have a code of rules and suggestions drawn out and lithographed for the guidance of clerks of the works and builders who are engaged in restorations. I take the liberty of laying one of these papers on the table, but will mention that they are of little use unless constantly pressed personally upon the attention of the parties concerned.

Secondly, The great enemy to careful restoration are contracts. The best course would be to carry them out by day-work, feeling one's way in the most timid and careful manner, and always striving to do as little as is practicable. When contracts are necessary a series of small contracts is better than one general one.

Thirdly, It is highly desirable to avoid uncovering a roof all at once. When re-roofing or re-covering the roofs is necessary, it is best to do it in small parts, and keep the rain out by temporary expedients as you go on.

Fourthly, It is often the case that the exterior of window tracery is hopelessly decayed, while the internal half remains sound. In such cases I hold the proper course to be the renewal of the outer half alone, attaching the new work by plugs and cement. We thus retain one-half in its original form, and ensure the correctness of the other half.

Fifthly, Patching and piecing, if done carefully, are infinitely preferable to more wholesale renewal. The various cements which we have now at our command enable us to introduce the smallest pieces into decayed or mutilated mouldings, which was formerly impracticable. Where the injury, however, is unimportant, it is better to leave it untouched.

Sixthly, Never trust a clerk of the works, or any unpractised hand, to obtain the sections of mouldings, or the forms of other features to be restored. It is often difficult enough to persons whose eyes and whose instincts have been

* A paper read by G. G. SCOTT, Esq., before the Royal Institute of British Architects. Continued from page 32.

sharpened by the habit of studying ancient features through a long series of years; to those who have had no such advantage, it is simply impossible, and one need not be astonished to find them, even with nearly perfect copies before them, producing forms scarcely resembling the original at all. I have often known them, even when they have passed a saw-curl (according to their somewhat barbarous custom), through a moulding, and ruled off its section, produce a result totally at variance with the old moulding.

Seventhly. Where an ancient feature has been destroyed never attempt its restoration till the parts round where the original existed have been thoroughly opened out and explored, and, where possible, in your own presence. Old fragments are in such cases nearly always discovered, and usually in great abundance and near their proper sites.

Thus fragments of a destroyed window are usually found in the wall which blocks up or surrounds the old opening. Blocked up niches, sedilia, or piscinae, commonly contain each their own debris.

Often, however, these are not quite sufficient to perfect a design, and the skill of the architect is taxed to the very utmost to judge what the rest would be.

This resembles the labors of the palaeontologist, who reconstructs the skeleton and the animal from a few broken bones, and, as in his case, the work is impossible to any but one thoroughly acquainted with his subject.

This is, indeed, a most important branch of the subject, and is by far the most interesting and cheering phase in restoration. In the hands of an experienced and painstaking restorer, it often happens that a design which had been almost utterly lost is, in a very great measure recovered; but this can only be done by long and patient study of the fragments discovered; and the work should be indefinitely postponed until these can be thoroughly explored and thoroughly studied. Too much stress cannot possibly be laid upon this. It is the very pith and marrow of restoration. If neglected it is destructive to the work, though if carried out fully, it is the great redeeming fact which compensates for many of the annoyances which restorations involve.

In such cases all the fragments which can be by any means grafted into the restored work, should be brought in at whatever cost. In difficult cases let the architect stick to it hard and fast, until his difficulty is solved; and let him set as lightly as possible by the conjectural theories which, one by one, occur to him, for he may almost depend upon it that they are wrong. With the single exception of Professor Willis, I never met with a man who could make guesses on which a moment's reliance could be placed. He does so simply because he has a wonderful intuitive power of putting together evidence in his mind which few possess, and still more because he never makes a guess until he has collected and thoroughly weighed his evidence. He has swarms of imitators whose practice is the very reverse. To begin with they only half understand their subject, and they build upon this defective foundation a superstructure of guesses running ahead of the evidence, and stuck to religiously after proof has been found of their fallacy.

To those who have not such intuitive perceptions, the only course is not to guess at all, or to set so loosely by your theories, that they may, one by one, go to the winds without a moment's regret, as fast as adverse evidence presents itself. I remember once investigating the design of a very much altered and mutilated window, when, after constructing a most satisfactory theory, a little bit of evidence turned up, which not only let it all down with a run, but involved the whole question in new obscurity. An excellent young assistant who was with me exclaimed, in a fit of impatient vexation, that he wished to goodness we had not found that nasty feature, for it had spoiled all our work. I replied, "Never regret evidence, however vexatious; for, depend upon it, it must lead to a right conclusion, or, at least, prevent wrong one." However, I could not at the time see my way through it; but some time afterwards, while away, a new thought occurred, and I went back and told my assistant that if, on cutting into the wall at a certain point, he found a certain feature, I could unravel the whole mystery. This was searched for, and found, and the whole of the evidence at once fell into its place; and the only remaining wonder was, how we could have been so stupid as not to think of so obvious a thing before. At other times, however, the result is so completely different from what we could possibly have anticipated, that one's wonder rather is, how one could have ever been so conceited as to venture upon any conjectures at all.*

THE BRITISH MUSEUM READING-ROOM.

WE have received the following official return of the number of tickets of admission to the reading-room, issued from 8th January to 31st December, 1861:—New tickets, 2,705; renewals, 4,850; Total, 7,555. The number of temporary admissions has been 827; and the total number of readers who have used the reading-room from 8th January to 31st December, 1861, 130,410.

THE QUEEN RAILWAY HOTEL, CHESTER.

THIS building, illustrated in our present Number, is approached by a covered arcade from the station. It is built of red brick, with Portland cement dressings; the roof is covered with Bangor slates. The interior accommodation consists of upwards of one hundred bed-rooms, with coffee-rooms and private sitting-rooms arranged on the ground and the one-pair floor. The total cost was about £15,000. It was executed from a design by Mr. T. M. Penson. A portion of the building was destroyed by fire in December last, and is being rapidly restored by Messrs. Clark and Jones, of Manchester, under the direction of Messrs. Cornelius Sherlock and Penson.

SCULPTURE CONTRIBUTIONS TO THE EXHIBITION OF 1862.—We understand that the colossal statue of "Cromwell" has just been successfully cast in metal by the Coalbrookdale Iron Company, Shropshire. This statue is intended to form part of the contributions of that celebrated firm to the forthcoming International Exhibition.

TO CHISEL THE WARPING OF PLANKS.—The face of the planks should be cut in the direction which lay from east to west as the tree stood. If this be done, the planks will warp much less than in the opposite direction. The strongest side of a piece of timber is that which in its natural position faced the north.—*Mechanic's Magazine*.

* To be continued.

PROFESSOR S. SMIRKE'S LECTURES ON ARCHITECTURE AT THE ROYAL ACADEMY.—LECTURE I.

THE first of a series of lectures on Architecture at the Royal Academy was delivered by Professor SMIRKE on Thursday evening, the 9th inst. The following is the first portion of the lecture:—

Early in the seventeenth century an Italian writer, Teofilo Gallaccini, composed a treatise of some ingenuity and merit, on the Errors of Architecture, and certainly he succeeded in bringing together a mass of architectural errors (horrors I might say), so shocking as to reflect no small discredit on the practitioners of his day. That day, it is true, was one of great darkness in his art. By an unfortunate accident it coincided with the date of the greatest activity, influence, and wealth of the followers of Ignatius Loyola, when churches and seminaries arose in great profusion over a large part of Christendom; hence that era was then and still remains distinguished from all preceding and succeeding times by the prevalence of, perhaps, the worst architecture that has yet been devised by human ingenuity. Not that the Jesuit's style of architecture, as it has been called, may not be admitted to be sometimes picturesque and bold—so much so, indeed, as to be occasionally most theatrical in its effects; but so entirely were all the rules of composition, I should almost say of common sense, ignored and outraged—so entirely was the sober truthfulness of our art disregarded—that I feel satisfied that I am confining myself to strict truth when I say that to the society founded by Loyola our art owes indirectly more of its degradation and decay than to any other school or individual whatever. Of course, I do not impute personally to himself any influence over the style which the buildings I refer to tended to propagate: I only regard him as founder of a religious society, who became the unconscious instruments of establishing a vicious school of architecture at a very unfortunate epoch of architectural activity. The author to whom I have above adverted had the great merit of seeing more clearly than his contemporaries the faults of contemporary art, and he deserves to be recorded among our worthies for his boldness in contending against the monstrous errors and absurdities that had sprung up with a luxurious rankness and rapidity which are really remarkable.

The very commencement of the sixteenth century, namely, the age of Bramante, of Raffaele, of Peruzzi, and Giulio Romano, was, as I have on a former occasion shown, in many respects worthy of being regarded as the culminating period of modern architecture; and the end of that same century saw the art, if not at its lowest ebb, at all events in a state of deplorable impurity. It is an old remark that all evil is but the corruption of what is good; and it seems to be in the nature of a law that no sooner has a point of excellence been reached than a process of deterioration commences. Fortunately, there would appear to be a co-existent law of social adjustment, for no sooner have we reached a state of apparently hopeless and helpless imbecility, than a glimpse of better things appears to restore our hopes and to redress the balance. The course, in short, of most human affairs may be correctly represented in a diagram by a series of antinodal lines, persistent in their ever varying irregularity.

Such, at all events, appears to have been the course of our art. The great effort of the distinguished artists whom I have named appears to have been—first, to make themselves thoroughly acquainted with the principles which guided the architects of the great Classic period, and then to devise such departures from the style of that period (still, however, adhering to the principles on which that style was founded) as would enable them to adapt their structures to the greatly altered habits, and to the new civilisation, of their own days.

There can be little difference of opinion among us as to the consummate genius and wonderful dexterity with which these modifications of the ancient manner were effected. Perhaps one of the most prominent modifications was the introduction of a regular fenestration, by which that essential feature, the window, was so treated as to render it a fertile source of beauty and interest. It is true evidences are abundant to prove that whatever may have been the case in still earlier times, windows, with their architraves and other somewhat ornamental adjuncts of like nature, were a recognised feature in Roman architecture; but I am aware of no ancient building having its various floors marked by uniform ranges of windows as decorated features, such as we find especially characterising the architecture of the Renaissance.

Another source of beauty, wholly unknown to Classic art—namely, the balustrade, is also due to the originality and inventive genius of the quattro-centists; and it is curious to note the avidity with which artists learnt to avail themselves of this novel and ingenious mode of turning so prosaic and utilitarian an object as a parapet into an ornament of great æsthetic value.

The systematic superposition of several regular orders was another practice particularly affected in renaissance architecture. It had, indeed, been suggested by the magnificent amphitheatres of the Romans, as well as by a rare instance or two of still earlier date, but was certainly not practised by that people generally, either in temples or in their domestic buildings. I have enumerated some of the more prominent characteristics of Italian art, which stamped it with originality, and gave birth to a school as widely differing from the primitive, strictly classical, school, as from the medieval school, which it supplanted.

Such was architecture at the beginning of the sixteenth century in Italy, then the instructress of Europe in the fine arts, as well as in most other branches of intellectual culture.

I have on a former occasion dwelt at sufficient length on the phases of our art down to this period—a period which, again adopting the language of a kindred science, may be regarded as an antinodal axis. A downward course here commences. It is an ungrateful task to record the weaknesses of men and the errors of genius; but perhaps it is a useful one. Perhaps there may be as much advantage derived from inquiring how and why art decayed, as in marking and admiring its growth and elevation. Such, at all events, is the task which I have this evening imposed on myself.

To inquire why art decayed after it had arrived at a point of great excellence is, perhaps, equivalent to inquiring why genius is erratic, why we are unstable in our judgment, and why human fancy is like the fabled bird of paradise, that exists only when on the wing.

Had the men who followed the bright period to which I have adverted been plodders on the highway of art, without soul or invention, and content to follow with painful exactness the footsteps of their predecessors, we might, perhaps, have seen an age of good imitators, and of a level platitude; a race of tame transmitters of the excellence of others, productive of a perpetual repetition of approved forms and established models.

But very far otherwise was the case. Art, in all its branches, throughout the sixteenth and even the seventeenth centuries, was in a state of excitement and

activity.' Vasari, writing in the middle of the sixteenth century, vaunted that such was the fecundity of art and facility of execution in his time, that six pictures could then be painted within the time occupied by the previous generation of painters on a single picture. The simple-minded historian of art seems to have been hardly aware that his vaunt implied rather reproach than praise; although it is true he has elsewhere amused his readers by the anecdote of an eminent painter who, at his easel, when called to his meal, replied that he would come directly, "for he had but one saint more to paint."

The growth of public wealth and the progress of civilisation brought into existence hosts of artists and of patrons of art. Popes and Potentates vied with each other in the patronage of it, and even kings would condescend to bid against each other for the corporal possession and exclusive monopoly of some favorite practitioner.

The consequences of such excessive stimulus were obvious and inevitable. Prosperity begot reckless and careless extravagance, and extravagance led to a rapid deterioration.

The real laborious artists of the fifteenth century wrought, no doubt, slowly and painfully,—urged onwards not so much by a thought of lucre or applause, as by a deeply felt love of their art; whilst the flattering crowd of artists who filled the scene in later times were the spoiled children of fortune, painting and carving and building with wonderful dexterity and readiness of execution it is true, and with a wonderful facility of invention in devising new shapes and fashions and fantastical combinations, but without that earnest, ardent, painstaking, and simple severity of study which had conducted their forefathers to real excellence.

By way of illustrating the vast change that had taken place during the sixteenth century, let us compare the works of Bramante, who flourished at the beginning of that century, with those of Borromini, who was born at the end of it. I have on a former occasion dwelt on the peculiar merits of Bramante. His was a pure, honest architecture, perfectly free from affectation and conceits of any kind whatever. His style appears to me to be all the more captivating from the very absence of all *ad captivandum* contrivances, and all the more effective from its manifest freedom from all seeking after effect.

If we turn from him to Borromini, we shall be shocked to see what devastation and corruption of taste had taken place during the one hundred intervening years.

The one sought to charm by his purely architectural feeling, aiming, for the most part, at those high qualities—order, symmetry, and rhythmical arrangement—which the great father of architecture, Vitruvius, had long before pointed to as the distinguishing character of good architecture; whilst the other set at defiance all order and moderation. The one never feared to draw a straight line, unless the requirements of his work seemed to render a curved or a broken line preferable for some special purpose; and surely a straight line seems to be, of all others, the line of architectural fitness, and therefore of beauty; whereas, Borromini must evidently have abhorred such a line above all things. He it was who, of all men, contributed most to the introduction of that system of architectural design (if it can worthily lay claim to the dignity of a system) by which masonry lost its special character, and its most appropriate forms. His façades curved inwards or bulged outwards on their plan, as if made not of hard stone, but of some yielding and plastic substance; and his pediments, totally forgetful of their primitive form, offered every variety of intricate convulsion and distortion.

Bramante called in the aid of sculpture with that charyness and caution which plainly indicated how highly he appreciated its noble attributes and fitting application; and as if he feared to vulgarise it by too frequent a use of it, or by excess of any kind. Yet, highly as he appreciated sculpture, he never permitted it to encroach upon the proper limits of his own special art. Sculpture was used by him as an honored accessory, well calculated to stamp a moral value on his work, and to give it a grace beyond the reach of mere architecture.

Borromini, on the other hand, permitted sculpture to dominate over the main object of his art without restraint; his whole building was literally sculptural, and his masonry was left to the humbler duty of forming a mere vehicle for the consolidation of some fantastic piece of clay modelling. Such had been the downward progress of architecture during the period to which I have been adventuring.

It must not, however, be supposed that the transition was sudden, or even rapid. The activity and energy of the sixteenth century were wonderful, and led to perpetual changes, and were constantly giving birth to novelties. New schools were founded, and eminent masters appeared in rapid succession, and of most opposite characters. Sansovino, with his superabundant wealth of sculptural resources; Palladio, with a moderation and purity of feeling far beyond his fellows; Michel Angelo, whose length of life enabled him to see out most of the brightest lights of Italy, although he was himself a fellow-laborer with some of the earliest and ablest masters of the great Italian Renaissance. Still, though the course of architecture was an onward course, yet it was also a descending course. The art lost its dignity, and became frivolous and trifling. Every part of a building seemed to be, as it were, in restless movement; curved lines were broken and inverted; straight lines were perpetually interrupted or diverted, and all breadth was frittered away by a multitude of lights and shadows.

It is worthy of note how great a sympathy has always seemed to exist between our art and that of the sculptor. Whether dignified and severe, noble or mean, natural or conventional, grand or grotesque, those two sister arts seem ever to have proceeded hand-in-hand; for ever sharing the same fate: rising together into greatness and sublimity, and together sinking into painful imbecility. Without going too far back into the history of art (although in remotest times the sympathy between the two arts was eminently conspicuous), we shall find the observation hold good in Medieval art. The culminating period of ecclesiastical architecture was precisely that which has been eulogised by our Flaxman as distinguished by high sculptural excellence. The quattro-centist introducers of modern art in both these branches shared like feelings, and were remarkable for like excellences. The sculpture of Donatello, like the architecture of Alberti, was alike vigorous and original, and full of delicacy of feeling; these high qualities being in both arts somewhat qualified, it is true, by a certain degree of hardness and rigidity. In Michel Angelo we find the same colossal and masculine breadth, whether we regard the examples he has left us of his sculpture or of his architecture.

Then, coming down to the epoch that more particularly engages our attention this evening, we shall find the same debasement pervading the two arts. I have already said that one of the marked characteristics of the architecture of the seventeenth century was that of restless movement; so also the sculpture of the seventeenth century exhibits, in an especial manner, the absence of that tranquil

dignity which is particularly becoming in sculpture, especially when applied as an accessory to architecture. A want of repose is almost equally offensive in both the arts. The eye is fatigued and the attention distracted by an excessive flutter in the details, whether we contemplate a building or a group of sculpture. Bernini set the example, but Borromini went far beyond him in this vicious treatment of the sculptural accessories of their respective buildings. Indeed, one of the most repulsive faults of sculpture at this degenerate period was its utter want of repose and the inordinate love of representing agitated drapery.

It is said of Bernini, by Milizia, that, although he was himself far from a pattern of sobriety in this respect, he yet knew enough of his art to condemn the fault in others. Remarking, on one occasion, the extreme agitation of St. Veronica's clothing under the dome of St. Peter's, he sarcastically inquired of the sculptor from whence the wind came that so seriously disturbed the Virgin Saint's drapery, seeing that she stood protected within the walls of the edifice. The sculptor, fortunately for him, had an answer that effectually disconcerted the critic: "The wind," he replied, "obviously came through the serious fissures in the masonry of the dome, occasioned by the critic's (Bernini's) want of skill in destroying the stability of the piers of that dome"; Bernini having shortly before somewhat rashly interfered with Michel Angelo's piers, by the insertion of colossal niches excavated out of the substance of those piers. Such were the mutual reprimands of these two most eminent artists, who contributed so largely to the degradation of their art. I am confident that I am using no extravagant or inordinate expressions, when I designate the architectural sculpture of the 17th century, in its treatment and mode of introduction, as ridiculous and absurd. Their sculpture may probably have been designed with boldness and vigor, and executed often with a masterly dexterity; certainly we cannot justly charge it with tameness or insipidity. Its faults were, indeed, exactly the reverse. There is a grotesque energy, a violence of gesticulation, which is, perhaps, very true to nature, if we seek nature in the wine shops of the Campagna, or among the Lazzaroni of the Chiaja; but the united voices of all cultivated artists will concur in condemning that style of nature as unfit for the study and imitation of sculptors.

A painter may, with perfect propriety, impart whatever degree of violent action his subject may demand; his pencil undertakes to realise to the eye actual scenes and if intense action is to be represented, he is most successful who best realises on the canvas that intensity. The case is, as it appears to me, far otherwise with the sculptor's art, at least when it is applied as the accessory embellishment of architecture. Statues in niches, or on balustrades, or otherwise fringing the sky-line of a building, must, I should think, be subdued, both in attitude and in treatment.*

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.

THE Annual General Meeting of this Society was held at the Architectural Galleries, Conduit-street, on Thursday evening, the 9th inst., when the chair was occupied by W. C. DUTTON, Esq.

The CHAIRMAN said that the President of the Society, the Earl of Ellesmere, who was out of town, had been consulted respecting the propriety of presenting an Address of Condolence to the Queen on the irreparable loss which the Fine Arts of the country had sustained in the death of his Royal Highness the Prince Consort. The noble Earl, in his reply, said:—"I think that, considering the late lamented Prince Consort's enlightened patronage and support of everything connected with Art, nothing can be more appropriate than that the Society should forward an Address of Condolence to her Majesty, upon a loss which they have peculiar reasons for appreciating. I shall be very willing to sign it in my capacity as President."

Mr. JEWELL moved the adoption of the following Address of Condolence to her Majesty, which had been prepared by the Council:—

To the Queen's Most Excellent Majesty.—We, your Majesty's most dutiful and loyal subjects, the President, Vice-President, Council, and other members of the Society for the Encouragement of the Fine Arts, venture to approach your Majesty with feelings of devoted attachment to your throne and person, most respectfully to offer the assurance of our heartfelt condolence in the deep affliction with which it has pleased the Almighty to visit your Majesty, in the premature death of his Royal Highness the Prince Consort. Upon the admirable qualities which illustrated alike the public and the private conduct of his Royal Highness in his exalted station, it is not for us on this occasion to dilate; the respectful gratitude of an entire people recognises them; the page of history will be their enduring record. But in one particular the character of his Royal Highness was essentially distinguished, and his course of action marked out to usefulness and honor beyond all other princes of his age—namely, his love of intellectual progress, his earnest support of all that could promote the application of the lights of science and the dictates of correct taste to the labors of industry, his enlightened patronage and encouragement of the fine arts, and the generous desire constantly uppermost in his thoughts for the extension of their pleasing and improving influences amongst all classes of the community. Under these circumstances the death of his Royal Highness occasions a loss which this Society, with the objects they have in view, have peculiar reasons to appreciate and deplore; and the recollection of them will form an enduring monument to the memory of his Royal Highness in the hearts of your Majesty's subjects and in the estimation of surrounding nations. May your Majesty also, in recalling them in after years, experience some consolation for your Majesty's late bitter bereavement. That your Majesty may long live to preside over the destinies of a loyal, devoted, and happy people, is the humble prayer of your Majesty's dutiful subjects, the members of this Society.

Mr. ATKINSON seconded the motion, which was unanimously agreed to.

Mr. HENRY OTTLEY, Hon. Sec., then read the following report of the Committee:—

The Council on the occasion of the third annual meeting of the members of this Society are happy to be able to report most favorably of its progress, and of its future prospects. The number of members has considerably increased since the general meeting last year, amounting now to 269, upwards of 60 having been added since the close of the last session. Amongst the new members, the Council have pleasure in recognising the names of several artists of distinction in the various branches of art, who in joining the Society have given the best practical evidence of their approval of, and sympathy with its objects. Additional strength, however, would still be desirable to enable the Society to carry out with greater efficiency the scheme of operations contemplated at its formation. The Council therefore venture to hope that members who by experience are aware of the usefulness of the Society, will exert their influence to procure amongst their friends new accessions to its ranks. For this purpose prospectuses, with programmes for the year, and forms of application for membership have been prepared, copies of which, members are invited to provide themselves with, to be made use of as occasion may serve.

A printed book of the rules of the Society, containing also a list of members corrected down to the present date, will be issued to all members in the course of the current month. A new edition of this book, with the list of members duly revised, will be issued at the commencement of every year.

The course of lectures given last year, for the first time, in fulfilment of one of the announced objects of the Society, proved highly successful, the lectures so kindly volunteered by members and others having been numerous, and the instruction they afforded very generally acknowledged both by those who heard them and those who heard of them in the columns of the press. A completely new course has, thanks to the same generous spirit of co-operation, been organised for the current year, many of the subjects having been selected with a view to the illustration of the Fine Arts Department of the International Exhibition of 1862. Members are informed that, with a view to the extension of the usefulness of these discourses, as well as to making more widely known the operations of the Society, they will be entitled during the current session to issue tickets of invitation to the lectures, in addition to the privilege of personally introducing a friend. These tickets may be had on application to the honorary secretary, or to the assistant secretary.

The prize system first put in action in the last session has been attended by most gratifying results; the judgment displayed in the award having met with general recognition, and the honours themselves having been acknowledged in flattering terms by the recipients. The prizes awarded in June last will be distributed at the first *conversazione*, instead of at the general meeting this evening, in order to give greater *clat* to the proceedings.

In the course of the last session *conversations* were held at the Mansion House, by kind permission of the Lord Mayor, one of the Vice-Presidents of the Society, at the Galleries of the Society of British Artists, of the Fine Arts Institute, of the Architectural Society, of the Architectural Photographic Society, and at the French Gallery, by kind permission of the respective societies and owners, to whom a vote of thanks will this evening be proposed.

On the occasion of these *conversations* musical artists of eminence came forward in the handsomest manner to lend their valuable services in aid of the intellectual enjoyment of the evening. To these ladies and gentlemen, as well as to M. Jules Benedict and Mr. Alfred Gilbert, who so ably conducted the musical arrangements, the warm thanks of the Society are especially due.

The arrangements for the *conversations* for the current session will be announced by a card to be sent to all members in the course of the first week in February. Considering the world-wide importance and interest attaching to the Great Art-gathering to be expected amongst us in the course of the ensuing summer, the Council, in conformity with suggestions made by several members, are desirous, if circumstances will permit it, to organise, in addition to the usual six *conversations*, a special reunion in honor of the distinguished foreign artists who may visit this country on the occasion of the International Exhibition, and they will be happy to receive co-operation or suggestions from members who may approve of that proposal, towards carrying it into effect.

After some conversation on the subject, Mr. JUKES proposed: "That a special general meeting of the Society be called, for the purpose of considering the propriety of giving a special entertainment by the Society to the foreign artists who might visit this country on the occasion of the opening of the Great International Exhibition."

Mr. RIVINGTON seconded the motion, which was agreed to.

MEMORIALS TO HIS LATE ROYAL HIGHNESS THE PRINCE CONSORT.

ON Tuesday a public meeting, convened by the Right. Hon. the Lord Mayor, was held in the Egyptian Hall at the Mansion House, "to consider the propriety of inviting contributions for the purpose of erecting a lasting memorial to his late Royal Highness the Prince Consort, and to adopt such measures for carrying out the object as may then be decided on," when the following resolutions were agreed to:—

That this meeting, deeply deploring the irreparable loss the country has sustained by the lamented death of his late Royal Highness the Prince Consort, whose powerful and well-regulated mind and great abilities have for more than twenty years been incessantly devoted to improving the condition of the humbler classes, and to the development and extension of science and art, and to the judicious education and training of the Royal family, is of opinion that a lasting memorial should be erected, commemorative of his many virtues and expressive of the gratitude of the people.

That the memorial recommended should be of a monumental and national character, and that its design and mode of execution be approved by her Most Gracious Majesty the Queen.

That committees throughout the United Kingdom be formed to raise subscriptions to the proposed memorial, and that her Majesty's subjects be invited to subscribe.

That a committee be formed, consisting of the following noblemen and gentlemen, to carry into effect the foregoing resolutions, with power to add to their number; and that the Right Hon. the Lord Mayor be president of the same, and treasurer of the fund.

The sum subscribed at the close of the proceedings amounted to about £4,000. Among the donors were—The Society of Arts, £1,050; the Lord Mayor, £100; Baring Brothers, £210; Rothschild and Sons, £210; Coutts and Co., £210; Gosling, Sharpe, and Co., £100; the Marquis of Ormonde, £105; Smith, Payne, and Smith, £100; Jones Loyd and Co., £100; Glyn, Mills, and Co., £100; Lord Kingsdown, £100; Overend, Gurney, and Co., £100; the Bishop of Exeter, £100; Mr. George Cubitt, M.P., £100; and Mrs. Cubitt (Denbies), £100.

At a public meeting at Manchester a resolution to erect a "fitting monument" was passed; the Mayor offering £500 towards a marble statue. Among the proposals was one to place a statue within a sort of temple. The idea should not be allowed to fall to the ground.

RATING OF BETHLEHEM HOSPITAL.—ARBITRATION.

LAST week a special meeting of the parish officers was held at the vestry hall, St. George's, Southwark, when the assistant officer officially presented the award of Mr. George Pownall, to whom the pending issue had been referred, whereby the annual value of the building grounds and premises was adjudged to be £3,075, and, inclusive of the house of occupation, £3,728. It appeared that the governors had instituted an appeal to quarter sessions against their assessment, which, according to the valuation of Mr. Charles Lee, was claimed to be rated at £1,800 a year. The parish officers in this instance retained Mr. John D. Paine, who had previously surveyed the parish, and whose valuation was somewhat over £4,000 for the hospital property. Mr. Pownall's award of £3,728 is, however, mutually binding on all parties.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

Correspondence.

SIR,—The monster evil which we particularly in the building trade have to contend with is that of strikes. Strike is the order of the day, and for a time has run rank as a murrain amongst the working classes of this country; an infatuation which no amount of reasoning or argument can change or even modify. What with our cheap and free institutions, &c., all got up with praiseworthy effort for the intellectual advancement of the working-man, it is to be deplored that we still find him with "strike" for his motto. Strike is the way in which he will reason, and strike is his argument and weapon with which he deals out destruction and misery to all concerned.

It matters not how absurd and unreasonable his demands may be, or how unprepared the employer is for such advance with hundreds or it may be thousands of pounds of contracts, all obtained and calculated from the cost of labor previous to such demand. It matters not what agreement may have been entered into, if such agreement be binding only by honor; for example take the plasterers of Manchester at present out on strike.

In the rules last supplied to the employers by the body or Association of Plasterers in Manchester, vide rule 8th, is the following clause—viz., "Either party wishing to make any alteration in the rules to give three months' notice in writing, the notice to expire between the 1st of May and the 1st of August ensuing." Yet whilst they have now struck work with two weeks' notice, and that not in writing, and in several cases without any notice whatever, for a further reduction of three hours per week in winter.

It is only a few months since they had three hours conceded to them, thus making 51 hours per week, 4½ hours less than in summer, and for which they are only reduced 1s.; another concession on our part, as they were up to last winter reduced 2s. for the 4½ hours. The disputed 3 hours per week for which they have turned out would bring the total to 48 hours, 16 of which they work by candle light, and, considering the nature of the employment, is not equal to 8 hours of daylight, and when employed outside they work from light to dark, this actually would make the entire week consist of less than 40 hours; which, with the summer hours of 55½, gives an average of 52 the year round.

The present average is 54½ and with the wages paid, the plasterers of Manchester, taking all into consideration, are already in advance of any other branch of the building trade in Manchester, if not in England.

All this we have explained to the workmen and reasoned with them, in every way, anxious if possible to avoid any hostile movement.

Until the contracts in hand were finished, we even offered them the 3 hours per week; that is, to have breakfast and begin work at half-past seven, our object being to reduce as much as possible the unprofitable, and to themselves dangerous, candle-light work, but they indignantly refused the offer.

We then proposed to have the matter settled by arbitration, this they also refused, and as we are unable to bear any additional burden, the profits of the trade having already been reduced until it is almost impossible to live by it, the prices being considerable lower now than they were 15 or 20 years ago, while the cost of labor is 40 per cent. higher, we have now no other alternative but to apply for other, and it is to be hoped more conscientious and reasonable workmen, and to appeal to our architects and the public for their assistance in carrying out our object against an unjust, and unwarrantable strike.

A MASTER PLASTERER.

Manchester, 13th January.

THE OBSTRUCTION AT THE EUSTON AND HAMPSTEAD ROADS.

SIR,—It is not at all surprising that "An Inhabitant of the Neighbourhood" of the obstruction in the Euston and Hampstead roads, should express the dissatisfaction which those living in the locality feel. It is felt as an universal reproach to all the authorities who have the control of the building departments of the metropolis. Where can the fault lie? * * *

Whoever of these is in fault, the public has suffered a great wrong, and a deformity has arisen in one of our finest thoroughfares, which in the city of Paris would not be allowed to exist one week. If the Metropolitan Board does not possess sufficient power to prevent a re-erection, which was originally a great blot, when it has once been taken wholly down, let them go to Parliament for increased powers. The great end for which it was created, was to prevent deformity in our streets, and I very much doubt if they can find one more prominent than the erection at the corner of the Euston and Hampstead roads * * *

A LOVER OF JUSTICE.

TENDERS.

VILLA, CROYDON.

For the erection of a villa, at Croydon, Surrey, for J. J. Segar, Esq., of West Derby. Quantities supplied. Mr. William Pace, architect, Temple-chambers, E.C.

Clark	£810	Poster	£790
Thomas	798	Hart	777
Colls and Co.	797	Wilkins and Bottom (accepted)	761

CHURCH, LAMBETH.

For building new Church in the Kennington-road, Lambeth. Mr. H. E. Coe, architect.

Patman and Fotheringham	£5,685
Willson	5,897
Higgs	5,389
Hill, Kidel, and Robinson	5,371
Thompson	5,362
Dowds	5,039
Jackson and Shaw	4,997

GATES AND PALISADING, HULL.

For entrance gates and palisading, Pearson-park, Hull.

Messrs. Newton, Chambers and Co., Thorncliffe Iron Works, Sheffield.	
Palisading, per lineal yard	9 3
Private Carriage Gates	£8 15 0
Private Hand Gates	4 15 0
Messrs. Young and Pool, Hull.	
Public Entrance Gates	£330

TO CORRESPONDENTS.

We cannot undertake to return rejected communications. WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favor us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

J. M. H.—Thanks.

T. C. B. (Bradford).—Shall appear.

C. M.—Plans only were engraved; they have been given.

R. X.—We cannot enter into such a discussion.

M. W.—In our next.

I. B. A.—Under the circumstances we cannot allude to the matter; we have received several communications on the subject.

J. L. C.—Shall hear from us.

B.—See notice in our last Number.

R. M. P. (Gloucester).—A view will be given in a few weeks.

S. H.—Thanks deferred for want of space.

RECEIVED.—H. B. Messrs. K. and W. James L. F. A., A Subscriber from No. 1, Pharaoh.

which should be addressed to the Publisher, 18 to 21, Old Bowell-court.

SANITARY CONDITIONS OF UPPER AND MIDDLE CLASS DWELLINGS.

SANITARY reformers and wealthy philanthropists appear to have been so intent upon improving the dwellings of the laboring classes, that they have sadly neglected the condition of their own homes, until they are made to pay the penalty for disregard of cleanliness in the shape of increased preventable mortality. Their conduct is a melancholy illustration of the tendency to wish to pluck the moat from a brother's eye and not see the beam in our own. Not that we are insensible to the advantages which have resulted from the labors of the rich to ameliorate the state of the habitations of the poor; but that we believe cleanliness like charity should begin at home. Example is a far more influential teacher than precept.

The report for last Saturday week of the Registrar-General on the health of the metropolis, reveals the sad fact that in the week preceding the rate of mortality had increased. The total number of deaths was 1,561 in that short space of time. The average number of deaths in the corresponding weeks of the ten previous years—corrected for the increase of population—is 1,440. Making the same correction, it will appear that 17 deaths occurred daily in the last week tabulated, over and above what should have been the death-rate according to averages, if no disturbing influence had been introduced. The increase beyond is much greater than it appears to be, when

we take into consideration that every year beholds an extension of drainage works, and a general improvement in the conditions of life within the metropolitan area that should go, but for the influences just alluded to, in the reduction of the average mortality. An increase in the average represents more than mere figures show; it points to the neutralisation of sanitary improvements. For all practical purposes so far as regards the saving of life, the enormous and costly improvements effected during the last ten years have been utterly useless. The money has been thrown away; for the metropolis is in a worse sanitary condition than it was during that period. To what extent it is worse, may be represented by saying, that the influences inimical to life are 1·4 per cent. greater than they have hitherto averaged, or that a Londoner's chances of life are diminished something like one and a-half per cent.

In presence of an increased death-rate, the first thing is to seek for its causes. Defective drainage cannot be the only one for, on the whole, it has improved, although in some localities it may be worse. There has been no fall of temperature till the last week to account for the excessive death-rate, for it has been 7·2 degs. above the average of the corresponding weeks during the last forty-three years. On three days the temperature was from 12 to 14 degrees above the average in warmth. Consequently, so far as thermometric influences are concerned, there should have been a diminution in the average mortality. Trade was not exceptionably bad, and if there have been want of employment and stinted food, they have certainly not gone beyond the average. Up to the present time the poor have not been exposed to unusual sufferings. We are, therefore, driven to conclude, in the absence of epidemic and of everything in the shape of contagious diseases, that the causes of an unusually high death-rate are to be sought in the water supply, and in partially defective drainage; and the data supplied from authoritative sources justify these conclusions.

First, as regards the water supply. We will take the three periods of 1851 before the companies were compelled to filter their supply, and to take it from purer sources than formerly; 1856, when the improvements had come into effect, and the last month of 1861.

"	Dec.. 1861	0·72	19·72

A comparative analysis of these figures will show that the organic impurity of the water we use to drink and cook now, has been augmented beyond that of the water in 1856 to the following extent:—Grand Junction, 0·42 deg.; West Middlesex, 1·44 deg.; Chelsea, 0·34 deg.; Southwark, 1·03 deg.; Lambeth, 1·03 deg.; Kent, 1·31 deg.; and East London, 0·27 deg.; while the organic impurity of the New River Company has been further diminished by 0·248 deg. We shall certainly not take upon ourselves to say that the increased organic impurity of the water supply is the only cause of the increased rate of mortality within the metropolis; but it would be to disregard the important and significant fact that the augmentation of filth in our drink is coincident with an unusually heavy death-rate. There is another remarkable coincidence to be taken note of—the diminished organic impurity in the New River water coincided with a reduction in the rate of mortality in the City of London; according to Dr. Letheby, during the last quarter of the past year the proportion of deaths declined 16 per cent. below the average.

It would be wrong to infer from the circumstances stated that the water companies are responsible directly for the increased pollution of their supply, or that they have neglected any of the onerous duties imposed upon them by the latest legislative enactments. That they have done their best honestly and thoroughly, by the filtration of their supplies, will be evident from an inspection of the table above, which shows that the total impurity per gallon has been diminished since 1851, with three exceptions, and their slight increase is susceptible of explanation by the increase of earthy particles carried down by the augmented volume of water which at this season percolates the soils and drains into the Thames. The diminution of total impurity is due to the efforts of the companies; the increase of organic impurity is due to causes beyond the control of the companies—to the augmented density of population on the area which drains into the Thames, and to the draining of fresh localities into the river. Since 1851 more than half a million has been added to the metropolitan population, whose disjecta conveyed into the river will account for the additions to its organic impurity, without taking into consideration the increase of population in the valley of the Thames above the metropolitan area. The inorganic impurities can be arrested by filtration, which the tables show the companies to have done, but the organic impurities are for the most part, too subtle not to escape the action of filtration. When the intercepting drainage of London is completed, and if sewage be diverted from the Thames, organic impurities will be, doubtless, diminished; but it must always be polluted by the storm-overflows from London sewers, and from the drainage into it of districts above and beyond the metropolitan area. The radical defect in our water supply is that it should be taken from the Thames at all, or, indeed, from any source into which sewage is drained. The new water supply to Paris is to be obtained from streams unpolluted by sewage, and care is to be taken not to allow animal excreta to flow into them. There was a golden opportunity ten years ago of doing as much for London, when the Honorable Mr. Napier pointed out the green-sand formation at Bagshot as sources for supplying us with pure soft water, which would have improved our health, and effected an economy in every household. The opportunity was neglected. The intakes of the water companies were removed up the stream, and we are now paying the penalty for our neglect and folly in the additional filth to the water we drink, and the increased offensiveness of the Thames from its diminished volume.

With regard to drainage, Dr. Letheby points to its defects in quarters not suspected, by his startling revelation of the change in the relative sanitary conditions of the dwellings of the wealthy and of the poor. Fever is, perhaps, the truest indication of defective drainage. Year by year, as cesspools were abolished and filth removed from under the habitations of men, there has been a gradual and steady abatement of continued fever. But during the last quarter, and without warning, the disease made its appearance, and caused a higher rate of mortality than ruled during any other quarter of the five preceding years. Instead of occur-

ing in districts inhabited by the poor, as formerly, fever has "migrated from the haunts of poverty to the confines of luxury." Since 1858 the fever cases attended among the poor by the medical officers of city unions has been reduced from 10 to 3 per cent. of all sickness. Fever is, therefore, in the course of being expelled from the abodes of labor, but as, on the whole, it has increased, it must have fortified itself in the homes of the well-to-do.

Dr. Murchison and Dr. Barker have "almost demonstrated" that the ruling fever is caused by noxious emanations from sewers and drains; consequently, the wealthy districts are worse drained than poor districts. For the explanation of this anomaly we must seek perhaps in the habits of "comfort" of the rich, in the defects of the localities they have chosen to settle on, and in the number of new houses built for the middle and upper classes. As a general rule, in lower class houses, drains have no communication with the interior; the closets are mostly in the yard or without the house. In better class houses they are within, and the better the class the more immediately are they in communication with the dwelling apartments and the bed-chambers, and the more numerous are they—one on every floor. Thus it is impossible to prevent miasms from penetrating into the interior, and being inhaled by the inmates. We do not speak of other arrangements which are imagined to be conducive to comfort, but which are very conducive to sickness. Again, the cisterns in which water is stored for drinking and cooking in better class houses are also employed to flush closets. Is it practicable for some of the miasms to escape into the cisterns, and be taken up by their contents? This is a point on which information would be very acceptable, and which might be easily ascertained by testing samples from cisterns and from mains in the streets. Should the stored waters prove to be polluted, the inhabitants have a complete remedy within easy reach and at trifling cost—the abolition of cisterns and the substitution therefor of constant service. The extra expense for the whole year would not be more than the head of a family will spend in tickets for a night's entertainment at the theatre or at a concert.

Fashion has made its abode in the lowest, worst-drained site in all London. Pimlico, Chelsea, and the neighbourhood lie so low that the sewers are often tide-locked, by which means miasms are driven back into dwellings. Their level is such as to afford no fall for draining into the intercepting sewers, and they will require a separate drainage system, with deodorising processes, to remove offensive matters from their midst. From the evils that spring from site there is no remedy until Mr. Bazalgette's scheme is carried out, which will be tantamount to raising the level, and even then the remedy may prove partial and incomplete.

In ten years 25,000 inhabited houses have been added to those previously erected in the metropolis, and a very large proportion of them are better-class houses. If the reader desires to see how many of them have been constructed in defiance of sanitary rules, let him go on a voyage of discovery in the neighbourhood of Notting-hill and the Regent's-park. He will there perceive new houses without basements, built on the soil, and with damp creeping up the walls from footings to roof, exhibiting itself in mildew and vegetation. The roads are ankle-deep in mud when it rains, unmetalled, and with the vegetable soil left exposed on the surface, interspersed with pools of stagnant water. Of course the drying of the roads necessitates the evolution of noxious gases, which find their way into neighboring houses. Not Agar-town, in the worst phases of its existence, exhibited conditions more unfavorable to health than do some of these new better class of streets. Can it be a matter of surprise, then, that fever should make them its abode?

ROYAL SCOTTISH SOCIETY OF ARTS.

At the fourth meeting of the session of this Society, Dr. NEWBING, President of the Society, in the chair.

Mr. WILLIAM FIRTH, Fellow, gave a description of a plan for forming harbors of refuge. Mr. Firth stated that the plan which he proposed to submit was one of the class known as floating breakwaters. It was founded on the well-known law, that "action and reaction are equal and opposite." The general feature of the plan was to break the waves by means of large pontoons or tubes of iron of great length and of considerable depth. It would be necessary to preserve the tubes from decay, and also from being drifted by high winds. The objection hitherto urged in respect of decay must in the present case be set aside, as, with the facilities now existing for effecting repairs, the same objection ought to apply to the Britannia-bridge and similar structures exposed to the influence of the weather. The quantity of water raised above the mean level or still water-line was almost equal to the quantity left below that line, and it must equally follow that the undulatory motion of the water was confined between two lines, one as much below as the other was above still water-line. The final consideration was that of making anchorage, which had been considered the chief objection to floating breakwaters. If it were considered that the tubes had no pitching motion, and consequently would not jerk the cable and anchor, there was some difficulty in arriving at any need for prodigious power in this element of the plan.

Mr. CUMBERLAND HILL, teacher, George Heriot's Hospital, then read a paper on "An Improved Time Gun Signal." Both papers were remitted to a committee for consideration. A reply to the address of condolence presented to Her Majesty was announced as having been received from the Secretary of State.

METROPOLITAN BOARD OF WORKS.—At the last meeting of this body several contributions were ordered to be made in aid of City improvements in Wadling-street, Newgate-street, and Fleet-street.

ON THE ESSENTIALS OF A HEALTHY DWELLING AND THE EXTENSION OF ITS BENEFITS TO THE LABORING POPULATION.*

IN acceding to the request of the Institute that I would, after an interval of twelve years, again give to its members some of the results of that experience which has been gained in my gratuitous efforts to promote the healthfulness of our dwellings, and more especially those of the laboring population, I feel that, however unattractive the subject may be in an artistic point of view, it has some peculiar claims on your attention, and that many of the difficulties with which it is beset can not only be appreciated, but their solution be probably in some measure aided by those whom I have now the pleasure of addressing.

In my paper read the 21st January, 1850,† reference was made to the great interest taken in this subject by our late illustrious patron, the deeply lamented Prince Consort, and his Royal Highness's own words were quoted, to show that "these feelings are entirely and warmly shared by Her Majesty the Queen," our most gracious patroness. Proofs of an undiminished continuance of that interest, as well as some of its practical results, will be stated in the second part of my present paper.

It would be doing violence to your feelings as well as to my own were this allusion to be unaccompanied by an expression of the most profound sympathy with our beloved Sovereign, for whom we earnestly pray that in this time of overwhelming grief abundant consolation may be granted from above. Shall we not also indulge the hope that ere long a knowledge of the great and wide-spread benefits resulting from the noble principles, highly practical wisdom, and bright example, which, alas! we must now speak of as a legacy left by his Royal Highness for the good of his family, his adopted country, and the world at large, will have their soothing influence on our bereaved Queen, as well as stimulate many to follow so bright an example?

In the grief so universally manifested at the death of this great and good Prince we all participate; but those who were honored by occasional intercourse with that illustrious person, and knew his kindly, courteous manner, must feel the loss more deeply. Some present can, no doubt, bear witness with me to the proof of real interest in the objects his Royal Highness deemed worthy of his attention, which was manifested by a remarkable appreciation of minute details—a characteristic feature of a mind as reflective as it was highly cultivated.

I might select a suggestive motto, suited to the subject before us, from one of the admirable addresses by his late Royal Highness, which it was my privilege to hear at the Aberdeen meeting of the British Association, and at the International Statistical Congress, held more recently in London; but I prefer adopting for that purpose a sentence uttered on another occasion by the ever to be lamented Prince, on account of the deep feeling of responsibility which it manifests, and the important principles which are so peculiarly applicable to my subject. It is the following:—"The blessings bestowed on us by the Almighty can only be realised in proportion to the help which we are prepared to render to each other."

In proceeding to point out the circumstances conducive to the healthfulness of a dwelling, some will be named which cannot be strictly termed "essentials," inasmuch as their absence may be compensated for. Such is the case where localities, though not elevated, have a good soil and are well drained. It may, perhaps, appear scarcely necessary to add that the healthy state of a dwelling will not be insured by any one, or even by the union of several of the features essential thereto, in the absence of others which are of equal importance.

The condition of "healthy," in regard to dwellings, arises out of a combination of circumstances, which comprise—

1. Those appertaining to the locality, including its soil, a free circulation of pure air, an efficient drainage, an ample supply of pure water, and a good aspect.

2. Those which are structural.

3. Those which depend mainly, though not wholly, on the occupants themselves—external and internal cleanliness, and a proper use of structural arrangements.

1. In regard to locality. High and dry situations, having a free circulation of air, whether occupied by groups of buildings, as in towns, or by isolated dwellings, as in the country, are proverbially healthy; whilst those which are low and damp, or surrounded by confined air, are the opposite. Experience, afforded by the state of troops when encamped, or when in permanent barracks or in hospitals, is conclusive on this point. It is a known fact that the mortality of troops in Jamaica has been diminished from 120 to 20 per thousand by their removal from the plains to the hills; and it is well ascertained that ague, dysentery and fever prevail in localities where the surface of the ground is naturally wet and insufficiently drained, or where there exists an accumulation of decaying matter, of which one sure indication is the presence of an abundance of flies. Dampness of situation is also productive of mental depression and bodily feebleness, which excite a craving for intoxicating drink. The embosoming in trees, or any other obstruction to a free circulation of air immediately round a dwelling, is prejudicial to health, and should, therefore, be avoided.

A soil of gravel is unquestionably the most healthy, and, next to it, one of sand. Clay soil, which, from its non-porous nature, retains the rainfall, is a frequent cause of the dampness so prevalent in the lower stories of houses in many localities—an evil felt as much in some which are elevated as in those at a lower level, and a fruitful source of sickness amongst servants, as well as the occupants of small houses, whether in towns or in the country. The precautionary measures which should be adapted when the soil is of clay will be noticed under the head of construction. A soil of chalk is usually attended with the disadvantage of its being necessary to sink a considerable depth for water; whilst its chemical properties, imbibed in the process of filtration, are injurious to some constitutions. Tanks or reservoirs for storing rain-water are, in such cases, often the most suitable expedient.

* Read at the Royal Institute of British Architects by HENRY ROBERTS, F.S.A.

† This paper was published, with numerous illustrative plates, by the Society for Improving the Condition of the Laboring Classes in 1850, under the title of "The Dwellings of the Laboring Classes, their Arrangement and Construction;" and it has, in a French translation, made by order of the Emperor when President of the Republic, been widely circulated in France. Considerable portions of it have also been published in Germany and in the States of North America.

‡ A process for softening water derived from chalk has been put in operation at Woolwich, and is said to be successful. In an article on sanitary legislation in England in the *British Almanac* for 1859, this process is noticed, and also the serious inconvenience often occurring from the oxidation of iron pipes used for soft water supplies, the only effectual remedy for which is an internal coating, or varnish.

Loose soil close to a house is a frequent cause of damp, which might be remedied by a flagging of stone or asphalt, and in many situations a dry drain ought to be formed round the building. Care should, therefore, be bestowed in regard to the surface of the ground about a dwelling, as well as in the selection of its site.

Drainage of the Soil and Surface.—Wherever dwellings are built on naturally wet ground, it is essential to their being healthy that ample provision be made for draining the soil, as well as for ordinary surface drainage and for the carrying off of surplus fluid from the house itself. The necessity for this description of drainage is generally more manifest in the country than in towns, their gradual formation and progressive increase having been generally accompanied with surface drainage under some form or other. Good surface drainage is, however, peculiarly necessary in towns built on an uneven surface, as is the case with the metropolis, which stands on low hills in the midst of an imperfectly reclaimed swamp, partially underlaid by a stratum of peat. The lower levels on either side of the Thames, where the drainage has been most inefficient, were much more severely visited by the cholera than the higher parts of the metropolis.*

House Drainage.—The providing efficient means for house drainage, as well as a good surface drainage, is a duty which, in the case of towns, obviously devolves on the public authorities. The consequences of a past neglect of this duty have been remarkably manifested at Windsor, where the prevalence of fevers and choleraic complaints having led to an investigation, the drainage of the town was found to be very defective, and without any proper ventilation to carry off the gases which form in the sewers; whilst, on the contrary, at the Castle, a separate and perfect system of drainage having been provided, no disease existed. The case of Bedford might be cited as another instance recently before the public. House drainage, should, as far as possible, be kept without the building, although the valuable modern improvement of glazed earthenware tubes with perfect sockets has greatly diminished the risk of an evil formerly so prevalent. Especial care ought to be taken that the pipes which discharge into them are properly trapped, in order that they may not become a medium for the escape of foul air into the dwelling.

Cesspools under basement floors, so common formerly, have been the cause of sickness and deaths innumerable. During the cholera in 1849, to my knowledge, several cases wholly traceable to this cause occurred in one house. Whenever these latent sources of mischief are discovered, they should be removed as quickly as possible. In many houses of the first magnitude, both in the metropolis and in the country, which are not of recent construction, this evil exists, as well as that of defective drains, causing the ground under the house to become sodden with fetid matter. The gases which originate in these places, and diffuse themselves over the dwelling, constitute one of those conditions of local impurity which exercise a powerful influence when the state of the atmosphere is favorable to an outbreak or spread of cholera, fever, or other kindred complaints. The abolition of cesspools within all dwellings is therefore a sanitary measure of the first importance.

Pure Water.—For an ample supply of pure water, one of the most important accessories to a healthy dwelling, the public authorities should, in the case of towns, be held responsible. The contamination of our rivers by their being unscrupulously, and at the same time most wastefully, made the receptacles of sewage, has rendered them very generally incapable of supplying the neighbouring population with pure water. Fully admitting the improvement which, in respect to its supply of water, has taken place in our own metropolis, it still remains far behind the metropolis of the Roman Empire, and even many of its provincial cities. Those who have traversed the Campagna di Roma can never forget the gigantic aqueducts whose ruins proclaim how abundantly and at what cost Rome was supplied with water. The practice which has to such an extent prevailed in our towns of obtaining water from wells, sunk not unfrequently near to a churchyard, has been very prejudicial to health, though its sparkling appearance and freshness to the taste might lead to the contrary supposition. Its impurity is generally caused by an infiltration from some neighbouring drain, cesspool, or other deposit of putrefying matter. Many such instances in the metropolis might be referred to.†

For dwellings in the country good drainage and ready access to pure water are not less essential than they are in towns, and they ought, therefore, to be made the subject of deliberate investigation before the locality of a dwelling is decided on.

The aspect of dwellings is often greatly dependent on local circumstances, and has an influence on their salubrity which is too much overlooked. In preference to all others, a southern aspect should be chosen, and where that is unobtainable, one inclining either to the east or to the west, so that the rays of the sun may enter at some part of the day. Rooms to be chiefly occupied in the height of the summer are exceptional, though in such cases I should give the preference to an eastern or a north-eastern over a due northern aspect. In towns the difficulty of obtaining a sunny frontage may frequently be great, if not insurmountable, but the importance of having the sun's rays within the dwelling for some portion of the day, especially in rooms occupied by children or by invalids, should never be forgotten. I could point to a large convalescent asylum in the country which is so arranged that the spacious gallery used by the patients for exercise during the greater part of the day is without the cheering and warming rays of the sun. Such defects tend to defeat the main object of the institution, and are a discredit to all concerned in the building.

The structural features essential to a healthy dwelling have now to be considered. In pointing them out I shall aim at the same brevity which has characterised my remarks on those appertaining to locality; and not doubting that your own recollections will supply the corroborative passages which might be adduced from Vitruvius, from Alberti, and other eminent authorities, I

abstain from quoting them, in order to avoid unnecessarily encroaching on your time and patience.

To secure the healthy condition of a dwelling its structure must be—1, dry; 2, warm; 3. The number and area of its apartments must be in proportion to the number of their occupants, and due provision must be made for all the requisites appertaining to daily life. 4. It must be well lighted. 5. It must be properly ventilated, and be free from noxious vapours of every kind.

1st. In order to a house being dry, it must stand on a dry foundation; and where this is not otherwise obtainable, artificial means should be adopted, either by forming a stratum of concrete, varying in depth according to circumstances, but never less than 12 inches, by a bedding of slate in cement, or by a bed of asphalt laid through the whole thickness of the wall under the floor level.

The lowest or basement floor should be raised not less than about 8 inches above the external surface, and if the floors are of wood, the ground beneath them ought to be excavated, so as to give a clear depth of not less than 12 inches, which should be ventilated by means of air bricks, built in the external walls.

Floors of stone or of slate should either be hollow, resting on brick courses, or be laid on a dry bed, prepared for the purpose, which is also essential in the case of brick or tile floors. In some parts of the country lime and sand floors are pretty generally used for cottages, and when properly made with a dry substratum are said to last upwards of 40 years. I have used Portland cement for the floors of living rooms in fireproof dwellings, but in places where there is much wear stone is preferable. Bed-rooms ought, in our climate, when not matted or carpeted, to have boarded floors.

External walls must be weather proof, of sufficient thickness to secure dryness and warmth. On the facilities for obtaining a good and non-porous material may depend whether brick, stone, or flint be used; whichever it be, good mortar is essential to dryness. In some places concrete, pisé or cob, with an external facing of plaster, or rough cast, may be employed with advantage, provided the foundation be dry, and the roof project sufficient. Hollow walls conduce greatly to dryness and warmth; they may be formed either wholly of brick, or externally of one of the other materials before named and be lined with brick or tile, a small hollow space being left between. The same advantages are desirable from the use of hollow bricks, and they are also well adapted for the lining of walls. A glazing on the external surface of brickwork is an effectual preventive of damp, and it is to be regretted that suitably glazed bricks are not easily obtainable at a moderate price. Their smooth surface is a great recommendation for internal work, on account of its non-retaining properties.

For the covering of roofs slate has with us so many recommendations that its general adoption may be readily accounted for; the evils attendant on its use arising from changes in the temperature should be particularly guarded against by boarding, felt, or by double plastering. Tiles are generally found to be warmer in the winter and cooler in the summer than slate, and requiring less lead are in that respect more economical. Projecting eaves should invariably have gutters, to prevent the drip which is often the cause of damp in the walls and foundations; the same evil too frequently arises from a stoppage of the rain-water pipes consequent on their being either too small, or their heads being unprotected from the intrusion of birds' nests, leaves, &c.

For the roofs of town buildings more particularly, a fire-proof construction,* such as was described in my paper of 21st January, 1850, has many obvious advantages to recommend its general adoption. But the practice, so extensively prevalent, of forming rooms for servants in the roof has an opposite tendency. In reference to fire-proof constructions I would take this opportunity of recalling a suggestion in a Paper read by my friend Mr. S. Smirke, 5th November, 1860, "On the Use of Coke," which, from its lightness, appears to be equally suitable for the purpose of vaulting, as the volcanic scoria or pumice known to have been thus applied in many important buildings in Italy and Sicily.

When the immense destruction of property caused by fire, and too often accompanied by the loss of life, is considered, the question of an efficient system of fire-proof construction generally applicable, appears to me to merit the very serious consideration of the Institute of British Architects, and I, therefore, venture this passing remark, though the suggestion is not immediately connected with my subject.

Wood of an inferior quality, or unseasoned, when used in any part of a dwelling-house is a false economy, whilst the cracks and shrinkages caused thereby are often prejudicial to health.

Lead, a material which enters into the construction of most dwellings, should be used with great caution for pipes which convey drinking water, and ought to be dispensed with altogether for cisterns, excepting those for the service of closets, on account of the injurious effects produced by the chemical action which frequently takes place when the water in them is soft. Iron properly varnished or enamelled, may be substituted for both purposes; and for cisterns, slate is very suitable. The offensive and unwholesome smell which often proceeds from sinks of lead or ordinary stone, renders the substitution of either of slate, or glazed stone-ware, or of enamelled iron, very desirable.

2. Warmth.—This in a dwelling depends not only on its aspect, its dryness, the materials used, their proper application and substance, as I have already noticed, but also on the structural plan, particularly on the relative position of the doors and fireplaces, as well as of the windows and spaces for beds, which should be so contrived that the occupants will not be exposed to draughts. With all our regard for comfort it is surprising that we do not more frequently endeavour to modify the effects of our variable climate, by the use of double sashes, which are so common in many parts of the Continent. This would be a means of retaining more of the small portion of genial warmth which passes into the room from our wastefully constructed open fireplaces, a subject on which, in connexion with the artificial warming and ventilation of dwellings something more will be said hereafter.

* I have the authority of Dr. Farr for stating that, if the mean of cholera epidemic of 1848 and 1854 in London be taken, nearly 11 per 1,000 of those living under 10 feet of elevation died, to 1 per 1,000 of those at the highest elevation; and that, if London be divided into terraces of different degrees of elevation, the mortality from an epidemic of cholera is, in round numbers, inversely as the elevation.

† One was recently mentioned to me by the medical officer to the General Post Office as having been the cause of much internal derangement to several of the employees in that establishment, and which had led to his recommending the use of the patent carbon filter. In late reports of the Registrar-General reference is made to a well at Sandgate as containing 49·90 grains of impurity per gallon; and in another at Hampstead as containing 53·60 grains, whilst the water from Loch Katrine recently brought to Glasgow, at a cost of £1,500,000, contains only 2·35 grains. The water supplied to London by six of the leading companies were found lately to contain 17·84 to 21·68 grains.

* I adopted the hollow-brick fire-proof construction here referred to, in the roof and floors of the two ranges of model dwellings for families built in Streatham-street, Bloomsbury, and in Portpool-lane, as well as in the lamented Prince Consort's model houses at the Exhibition of 1851. Recently the efficacy of this mode of construction was tested at the Streatham-street houses by a tenant, who accidentally set fire to the woodwork of his apartment, to which the fire was limited. Hollow bricks, with wrought-iron girders, are now very extensively used for floors in Paris. Thirty years since, when constructing Fishmongers' Hall, I used, over the kitchen and in some other places, a vaulting of earthen pots, hollow bricks being then scarcely known, though they have been found in the remains of Roman buildings in this and other countries.

3. The number and dimensions of the apartments essential to health in a dwelling must be proportionate to the number of its occupants, and suitable provision must be made for all that appertains to a well ordered domestic life, not only that of the master and mistress as well as of the children, but also that of the servants, whose health and morals it is the duty of their employers to care for.

The amount of space required for health being greatly dependent on efficient ventilation, it will be considered under that head. In most dwellings the scale of accommodation chiefly depends on the means and circumstances of the occupants, in which the variety is so great that I shall not attempt giving anything but a brief outline of what may be termed the minimum provision which ought to be made for a family consisting of parents and children of both sexes, belonging to the laboring class, undoubtedly the most numerous section of the community. A laborer's dwelling in the country should have a small entrance lobby, a living room not less than 150 feet in area, a scullery of from 60 feet to 80 feet in area, in which there should be a stove or fireplace for use in summer, as well as a copper and sink; there should also be a small pantry. Above should be a parents' bed-room of not less than 100 feet area, and two sleeping-rooms for the children averaging from 70 to 80 feet superficial each, with a distinct and independent access. Two of the sleeping-rooms at least should have fireplaces. There ought also to be a properly lighted, ventilated, and drained closet, as well as suitable inclosed receptacles for fuel and dust. The height of the rooms, in order to their being healthy, should be scarcely less than 8 feet, and even 9 feet would be desirable but for the extra expense. With a view to ventilation, the windows should reach nearly to the ceiling, and the upper part be invariably made to open. In windows which have transoms as well as mullions, some of the upper compartments may be hung on centres for this purpose.

It may be deemed almost Utopian to indulge the hope of seeing such accommodation as this placed within reach of those of the laboring population who are doomed to reside in towns; but those who for several years have been striving to place the benefits of a healthy dwelling within their reach, whilst knowing by experience something of the numerous difficulties to be overcome, and being fully aware that, in many cases, it may be impossible to accomplish all that is desirable, ought not on that account to be daunted in the pursuit of an object of such great and wide-spread importance.

In returning from this digression to the structural features of a healthy dwelling, I would point out the great importance of direct external ventilation and light to all waterclosets, including those for servants' use. It is obvious that constructive defects here must be a very serious evil. The pipes to waterclosets should be protected from the effects of frost. I notice also that it is of much importance the chimneys should draw so that the smoke will properly ascend; when it does not, the air is greatly contaminated by its escape into the dwelling. The smoking of chimneys, if not caused, as it often is, by the want of sufficient air in the apartment, or by bad management in the first lighting or in the putting on of fuel, frequently arises from the proximity of more lofty buildings, or of trees, and too often from a defect in the construction, such as being too large to ensure a continuous upward current—an evil which may be sometimes cured by a contraction of the throat. For all ordinary chimneys, flues 9 inches square, or, which is decidedly preferable, 10 to 11 inches diameter, are quite sufficient. Kitchen chimneys are exceptional.

4. Light well diffused over all parts of a dwelling is essential to its being healthy. A dark house is not only gloomy and dispiriting, but is always unhealthy. We know on high medical authority that "the amount of diseases in light rooms as compared with dark ones is vastly less." Light ought to be diffused over the whole dwelling, so that no dark corners be left to invite a deposit of that which is untidy or offensive. Happily the motive which in times past led so much to an exclusion of the light of heaven no longer exists, and though ages may pass ere the evils resulting from a vicious legislation are entirely swept away, yet the removal of the tax on windows and of that on glass must, amidst much to discourage those who have long and zealously labored in the cause of sanitary amelioration, be regarded as most valuable concessions in its favor.

5. Ventilation and Artificial Warming.—These are questions of vital importance in regard to dwellings, though, judging from the neglectful indifference of multitudes, their value is far from being duly appreciated by the educated, and even by some in the scientific classes of the community. Were it otherwise, the closeness perceptible on entering many of their dwellings, the oppressive heat of the rooms, the sickening fustiness in the apartments occupied by the servants, and too often in those of the children, would certainly not exist. When the numbers of hours passed within doors by every human being in a civilised state is considered, it will be manifest that the breathing of vitiated air for so large a portion of the twenty-four hours must be as injurious as living on unwholesome food.†

T-SQUARES.—At a recent meeting of the Franklin Institute, U.S., Mr. Nystrom showed several specimens of improved T-squares. He said, simple as this instrument seems to be, it is difficult to procure one that will satisfactorily answer the purpose for which it is intended. The rule of the square is generally made of hard wood, which is apt to warp, and it is heavy and clumsy to handle on the drawing board. The most suitable wood for a T-square is *spruce-fir*. This wood is not affected by a change of weather, and therefore will not warp; it is among the lightest of woods, its specific gravity, when well dried, ranging between 0.4 and 0.5, but it is too soft to be used against the drawing pen, in consequence of which it is necessary to line the edges of the rule with a harder wood. It is of great importance with what kind of hard wood the spruce-fir rule is lined. Most of the hardest woods are not suitable for the purpose, as they warp and twist the rule, and in some cases will separate from it. Maple is found to be the best for the purpose; it is a fine grained, hard wood, and its specific gravity, when well dried, is only 0.6; its behaviour in changes of weather coincides very much with that of spruce-fir, and it is therefore best adapted for this purpose. —*Mechanics' Magazine*.

* The late Mr. Thomas Cubitt told me that he had frequently cured smoky chimneys, in houses of his own building, well known to be amongst the best in London, by an imperceptible admission of a little air over the room doors, the woodwork fitting so closely that sufficient air could not, when they were closed, gain admission to the room.

† To be continued.

THE HOUSE OF NASSAU, AND FOUNTAIN, NUREMBERG.

THE irregular streets and squares of Nuremberg, have a wonderfully quaint, picturesque, and ornate character, and the traveller wandering through them, may easily imagine himself transported back a few hundred years into the past, such an air of antiquity pervades the city.

Many of the dwelling-houses are still inhabited by the families whose ancestors originally built them. As a rule, they are of narrow frontage, with acutely pointed gables, the roofs garnished with an abundance of dormer windows. Though narrow, the houses often extend back from one street to another, enclosing two or three courts. The ground-stories were low and vaulted, and usually occupied as warehouses, the upper and domestic portions were elaborately carved and stuccoed.

Das Nassauer Haus—the House of Nassau (of which we give an engraving on another page), stands nearly opposite the church of St. Lawrence; it is considered one of the best examples of the domestic architecture of the city. The style is true German Gothic, it was built at the beginning of the fourteenth century in the reign of the Emperor Charles IV. The angle turrets are very marked features, and together with the high-pitched roof, and battlemented and richly panelled top, form an artistic termination to the somewhat tower-like building. The centre oriel window is very beautiful in design and execution. The little drinking fountain below is of modern date; it is decorated with a statuette of the Emperor Adolphus of Nassau, at whose desire, the Church of St. Lawrence was built. The fountain in front of the house is rich in sculpture and metal-work.

Nuremberg has been regarded as the cradle of the arts, but many other things were nurtured in the Imperial city, which have exercised a vast influence on mankind. Cannon are said to have been first cast in Nuremberg in 1356. Playing cards (perhaps invented there), were certainly manufactured in the city as early as 1380. The first watches, called "Nuremberg Eggs" from the shape, were made there by Peter Hele, in 1517. The first gunlock in 1517. In 1390 a paper mill was built, the first in Germany. In 1550, Erasmus Ebner found out the alloy of metals now called brass; the clarinet was invented by Denner in 1690. We might easily enlarge the list: a wonderful city was and still is Nuremberg.

ARCHÆOLOGICAL INSTITUTE.

At the meeting held January 10, W. TITE, Esq., M.P., V.P., in the chair, Mr. PETRIE communicated drawings and a notice of remains of a church of circular form, called the Girth House, existing in Orkney, near the ruins of the palace of Jarl Paul, who resided there in the twelfth century. As an example of this peculiar type, of which so many are to be found in the northern parts of Europe, this little church is believed to be unique in North Britain. In general plan it precisely resembles the little church at Altenfurt, near Nuremberg. It is remarkable that no church of this form exists in Ireland.

Professor DONALDSON then made some remarks on this curious class of ecclesiastical structures, and the examples in our own country, all of which belong to the twelfth century; and Mr. TITE invited attention to the Round Church at Northampton, which he had lately visited: it had suffered much from neglect and decay, and is now in course of restoration, under the care of Mr. Scott.

A memoir was read, addressed by one of the Foreign Correspondents of the Institute, Count Tyszkiewicz, a learned Associate of the Society of Antiquaries of Wilna, and illustrative of various primeval antiquities—entrenchments, tumuli, &c.—in Lithuania. Of these a series of careful plans were sent for comparison with those of similar remains in Britain. After some general observations of considerable interest in regard to the archæology of his country, the Count explained the divisions under which the ancient vestiges may be classified: namely, the singular earthworks at the confluence of rivers; entrenched sites on the summits of mountains, sacred, as supposed, to the worship of the gods, and where small circular cavities occur constantly, in which ashes and charred wood are found, the traces, it is believed, of sacrifices; the third class includes mounds and earthworks, believed to have been destined for holding councils or for judicial proceedings; and, lastly, were described the tumuli, called Kurhany; some of them being nests of observation, like watch-towers; others following the lines of ancient roads, whilst the greater number are sepulchral, and in these are found weapons and relics of stone, bronze, and other metals, analogous to those by which the vestiges of the earlier periods are characterised in England and other parts of Europe. Beads of colored glass and of amber are likewise found in abundance.

A discourse was then delivered by Mr. E. LLOYD, of Ramsgate, controverting the opinions of the Astronomer Royal, and of Mr. Lewin, relative to the spot where Cesar landed in Britain. Mr. Lloyd was disposed to regard Shoultan, to the west of Deal, as the precise spot; and he contended that at the time when Cesar approached the British coast the flood-tide carried him strongly to the northward. He proceeded to point out, from his local knowledge, the great physical changes which had taken place in that part of the coast between Deal and Ramsgate, and especially in regard to the estuary formerly existing between Sandwich and Reculver in the direction now indicated only by the course of the Stour; he declared his belief that these results had been chiefly produced by the deepening of the channel in the Straits of Dover.

A notice was then read of the Brecken-stone, the remains of a Roman pharos on the Western Heights, at Dover, and of which was exposed to view last summer in the course of forming barracks, a photograph was exhibited. The shapeless mass of masonry, known formerly as the Devil's Drop, is mentioned by Lambard and other writers on Kentish Antiquities; it probably marked the site of a Roman pharos, on the west side of the harbor at the mouth of the Dover. The lords warden were in olden times sworn into office on this Brecken-stone, which had been covered up with chalk and rubbish, and concealed from view in 1806, to be again exposed for a few days during the recent operations, and again wholly lost and forgotten.

Leeds.—New Chapel.—The Baptist denomination of Leeds have just opened a new chapel. The building, erected under the superintendence of Mr. T. Ambler, architect, of Leeds, is in the Italian style. The walls are being carried up to the floor with pitched face wall stones, finished with a stone string, from which commence pressed brick walls. Each side is divided into four bays, having windows with circular heads, glazed with ground glass. The chapel is arranged with baptistery and communion pew, and will seat 375 persons. The seats are all open, with octagon ends. Part of the roof is seen, with curved braces resting upon moulded stone corbels, the plaster work being carried partly up the slope of the roof. The woodwork is stained and varnished. There are two vestries in the rear of the chapel, and room for heating apparatus, and also a small yard with conveniences. The chapel is lighted by two sunlights near the ceiling. The total cost of the building has been over £800.

LIVERPOOL ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

AT the seventh meeting of the session, held at the Royal Institution, Mr. J. M. HAY, the President, who occupied the chair, alluded in feeling terms to the decease of the Prince Consort, which had thrown a nation into mourning, and cast a gloom over every household in her Majesty's dominions; and that, while the sympathy for our widowed Queen was as heart-felt as it was universal, they, as architects and lovers of the arts, had especially to regret the death of his Royal Highness, from the recollection of what he had done to promote the interests of art, and extend its influence among the people.

Amongst the donations presented was one from Messrs. W. and G. A. Audsley, architects, being a copy of the "Sermon on the Mount."

The PRESIDENT passed some eulogistic remarks upon Messrs. Audsley's donation, and a vote of thanks was passed to those gentlemen by the Society.

Mr. SAMUEL HUGGINS then read a paper on

THE WALLS AND ROWS OF CHESTER.

After some introductory observations, Mr. Huggins remarked that Chester was a gem of cities, and a gem beautifully set. Its natural site alone, for its native attractions, was worthy of a high degree of admiration. The most important, though not the most unique, feature of the city, that which contributed most to its beauty and enabled you the better to behold and appreciate all others, was the Walls, which, though the work of man, were as vital as the rock on which they were built; as much recognised by nature as the trees which clung to or cast their shadow on them. The walls were said to have been originally built by the Romans, and there was a Roman grandeur in their conception which greatly favored the supposition. They presented in many parts a most imposing aspect to the surrounding localities, and gave a grandeur to the outskirts of the city which few masonic constructions could have secured. Though no longer needful for defence, they were anything but useless. There was scarcely a more delightful promenade in England. A walk round the walls of Chester was like a dream, for the strange variety and mixture of objects of every kind and style and form, and of every date, from the ephemeral erection of yesterday to the historic fane of ten centuries ago, that passed in array before you. Here you were greeted by the harsh utilitarian genius of the age—there you communed with the hoar spirit of antiquity: on this side were embodiments of the present; on that, mementoes of the past, in gazing upon which you were looking back into time as well as out upon space. One moment you encountered an object of poetic beauty, the next presented you with something of utilitarian homeliness. On one side you might step out on to the green turf, on the other you were in a region some hundred feet above it, high over roofs, and chimneys, and tree-tops. Mr. Huggins entered into a particular and critical review of the cathedral as the most important object of art. St. John's Church, which was visible from many points, he warmly eulogised as a fine specimen of Norman and pointed Gothic. The ancient choir and Lady chapel at the east end, now abandoned as a ruin, was, even in its present state, one of the most graceful objects anywhere to be met with, and went to prove that the works of the architect into which the vital spark of beauty had been once breathed will long retain the impress of its spirit, and, like the fairest works of the Creator, be beautiful even in dissolution. He regretted that, in the important restorations now going on, faithfulness in adhering to the original should have gone to the extent of restoring its defects, as regarded the present destination of the edifice as Protestant church; and that the opportunity should have been neglected of so far modifying the plan as to remedy the great deficiency of light, which could easily have been done by piercing a few of the blind arcades of the clerestory, which would not in the least have interfered with the style. Could the original architects, who belonged to a fraternity remarkable for nothing more than their strict attention to utilitarian requirements in their works, be brought from their graves, they would smile at our solicitude to preserve what they would at any moment have sacrificed to fitness—especially if made aware of the great intervening event which we call the Reformation. He noticed a variety of other objects and scenes which the walls commanded, and concluded his remarks upon the latter by observing that they were by no means an obsolete feature. Nothing could be more suggestive to the projector of a new town, or improver and beautifier of an old one, than the walls of Chester. A characteristic of Chester that deserved particular notice in any account of its architecture was that, owing to the apparent contentedness of the wealthy to dwell among their poorer fellow-citizens, it contained houses of all classes, from the highest to the lowest, all mixed up together in the most easy and natural manner imaginable. This, he considered, was one great source of the picturesqueness of the place, and remarked that there was something in it pleasing to the moral sense as well as to the sense of beauty. It gave, he thought, a sort of perfection to a neighbourhood when it was inhabited by a variety of classes that enabled an individual, whatever his rank in life, who felt as he ought to feel, more at home, more embosomed in human society, than when he was among his own class only, isolated from all others. He entered into a critical notice of the Rows, which, unique as they were, and strangely unproductive as they had been of any modern progeny, were, in their corrected, idealised form, as applicable in the present day to the streets of London, Liverpool, or Manchester as they ever were in Chester, and where their introduction would relieve architects from the necessity under which they at present lay, through the requirements of shopkeepers, of producing ugliness in their shop designs. Chester, though eminent for the beautiful, was somewhat behind in the useful. It was wanting in sanitary regulations. In some localities it was too densely built upon, and contained houses deficient of light and air. It had a handsome railway station, but that was not connected with the city by a proper thoroughfare. There was a deficiency of bridges connecting the two sides of the river. There was a gate wanting to connect the walls across Grosvenor-street. He remarked upon the character and position of the various public buildings, and expressed his surprise at the meanness of the building devoted to the post-office, a public department which, from its importance, might be expected to be located in one of the finest edifices in the city.

THE HORTICULTURAL SOCIETY AND THE INTERNATIONAL EXHIBITION.—Her Majesty's Commissioners and the Council of the Royal Horticultural Society have entered into arrangements, by which it is agreed that the price of a season ticket of free admission to both the Horticultural Gardens and the Exhibition, shall be five guineas.

INSTITUTION OF ENGINEERS IN SCOTLAND.

AT the second meeting of the session seven new members and one associate were proposed and fifteen gentlemen were elected members of this Institution.

Mr. A. ALLAN then read papers on an Improved Duplex Spring Buller and Draw Springs for Railway Plant, and on Improved Roof Lamps for Railway Carriages, after a discussion on these papers,

Mr. E. HUNT gave a description of a German veneer-cutting machine, in which a straight saw blade is used, being stretched in a frame of the ordinary construction, consisting of a style with cross-heads at each end and a back tension rod, and the frame is made to reciprocate by a crank and connecting rod, the crank shaft being carried upon a separate block, situated to one side. The saw frame is peculiarly guided; each of its cross heads has attached to its under side two small swivelling sliders. These project horizontally in opposite directions into small square grooves, formed in the inside vertical faces of the guides, which are bolted down to a cast iron plate, fixed along the front of the bench. The guiding grooves are not straight, but curved slightly upwards from their inner ends towards the opposite outer ends, and by this ingenious contrivance a twofold advantage is obtained. The saw is made to do an equal amount of work in both directions of its motion, whilst the upward feed of the log is continuous, and the saw cuts inwards towards the centre from both edges of the log, and has in consequence much less tendency to break through the veneer near the edges when the wood is brittle. Another important feature of the saw-frame guides, is the provision for lubricating them. Lubrication by hand or by ordinary appliances must be somewhat in excess to insure efficiency; and as a consequence, the oil is thrown about by the rapid motion and injures the veneers. In this machine the lubricating oil is put into small brass cylinders or pumps, one for each guide, and communicating with about the middle of it by a small tube. Each cylinder or pump, is provided with a piston which is gradually screwed down by a movement derived from the feed motion of the machine, and this feeding action of course only takes effect whilst the saw-frame is in motion. The supply of oil is by these means accurately adjusted to the requirements, and there is no waste, nor is any thrown about. The saw blade is placed vertically with its teeth directed downwards. It will be understood that the teeth are shaped to act similarly in both directions; in side view they resemble lancet points projecting at short intervals from a straight edge; they are very slightly set, alternately to opposite sides.

Instead of the guiding surface upon which the saw blade runs being straight, a slight convexity inwards is imparted to it. It is practically impossible to stretch a thin steel band so tightly that it will not buckle or bend out of the straight line when subjected to varying strains. A very little lateral strain will make it move slightly out of the straight line; but if it is by any means kept slightly out of that line, it will require a much larger proportionate strain to make it recede still further from it. Thus the saw blade being already stretched over a curved surface, cannot be made to spring from that surface with anything like the ease with which it would spring from a flat surface, being equally stretched in both cases. In a knife 33 inches long, the convexity is about $\frac{5}{16}$ ths of an inch, the length of the saw-blade being 6 feet; but the amount of convexity is varied in different cases.

These various contrivances permit of a very thin saw-blade being used, and as the saw removes from between each veneer, and wastes, a thickness of wood at least equal to its own thickness, a reduction in the thickness of the saw-blade involves a direct diminution of the waste. Specimens of the veneers cut by these machines were exhibited. It is common for them to obtain from 14 to 20 veneers of a moderate thickness from the inch of wood, but as many as 36 can be got from the inch if required; the veneer is, however, in this last case rather too thin for satisfactory use. To show how refinement in one part of a machine leads to, and in fact necessitates an equal refinement in other parts, it may be mentioned, that the full advantages of these machines cannot be realised with the saw blades in the state in which they are received from the makers. In appearance the blades are well made and finished, and the surface seems smooth and the thickness uniform. It is, however, found to be absolutely necessary to pass them through a special machine, whereby their surfaces and thickness are by a planing process rendered sufficiently true and uniform. In the case of resinous woods, the heat caused by the sawing action is apt to soften the resinous matter, and very much increase the frictional resistance to the saw-blade. To overcome or lessen this difficulty when it occurs, a lubricant is applied to the saw-blade, and the one found most suitable is a solution of salts of lemon or oxalic acid.

During the discussion which followed, the author remarked, that it was not intended in the paper to raise the question of novelty respecting any part. The machine had simply been selected for description as one which contained all the most recent improvements. The paper was designed to be the first of a series on wood-working machinery, and was a description of the best—as far as he was aware—of that class of veneer-cutting machines. The Institution would undoubtedly be gratified by receiving a description of a good circular-saw veneer machine. It was intended, if those who had it in their power would give their assistance, to publish in the Transactions descriptions of the best machines now in use for the various operations of working wood; and there was no doubt it would form a very interesting series, and that it would be very valuable for reference.

MANCHESTER LITERARY AND PHILOSOPHICAL SOCIETY.

AT an ordinary meeting held December 24, J. P. JOULE, LL.D., President, in the Chair,

Mr. BROCBANK exhibited some samples of steel manufactured by Mr. Bessemer's process. These specimens had been bent and twisted cold, and showed a remarkable degree of ductility. He stated that the Bessemer steel was one of the most plastic and manageable of metals, more so even than copper. It could be bent, flanged, or twisted, either hot or cold, without annealing, and over a considerable range of temperature—which is not the case with ordinary steel or copper. A plate of 18 inches diameter had been forced through a series of dies until it formed a tube 13 feet long and $1\frac{1}{2}$ inch diameter, without any crack or flaw. A ring of metal could, at one heat, be hammered into a die to form a locomotive engine chimney-top. In drilling a circular hole into a plate continuous shavings are formed, whereas, in copper or Low Moor plates, or any other metal, the shavings break into pieces $\frac{1}{16}$ in. long. Thin sheets of the Bessemer soft steel can be bent backwards and forwards hundreds of times without a fracture, and are almost as flexible as paper.

INSTITUTION OF CIVIL ENGINEERS.

ON Tuesday, January 14th, JOHN HAWKSHAW, Esq., F.R.S., President, in the Chair. Mr. Hawkshaw delivered his inaugural address, in which he adverted to the wide range of subjects embraced by the profession of a civil engineer, and observed that in no pursuit was progress more apparent than in it. Thus, within the last thirty years, about 70,000 miles of railway had been made in different countries, at an outlay of eleven hundred millions of pounds sterling, fully one-half of which expenditure had been under the direction of British engineers. Again, in 1815, the swiftest Atlantic packets depended wholly on sails, and the voyage occupied twenty days, whereas now the journey was performed by steamers in nine days. Ten years ago the steamboats plying between Holyhead and Dublin, then as now, among the fastest afloat, had attained a speed of seventeen miles an hour, whilst last year the new boats reached a speed on their trial trips of twenty and a half miles an hour.

Since 1848 the speed of Her Majesty's screw line-of-battle ships had been doubled. During the same period the build and construction of steamboats had been greatly improved, and the doubts which prevailed until very lately whether iron was the best material for line-of-battle ships seemed now nearly dispelled, although the rapidity with which iron fouled would, unless some remedy could be devised, always be a source of trouble. The precise and the best mode of constructing iron ships of war was next considered, and it was urged that, by the adoption of an improved system, the whole of the iron used in their structure might be made to add to the strength of a ship, as well as be useful for its defence, which was not the case at present. With regard to speed, it was with steamers, as with locomotive engines, a question rather of what velocity we could afford to pay for than of what rapidity could be physically attained, for there was no doubt the speed of either could be accelerated beyond any point the nation could at present afford. With respect to railways there was an anomaly which before long would require attention. Thus, to make way for passenger trains, goods and mineral trains were in many cases hurried on, manifestly to the prevention of due economy.

In grouping engineering works the electric telegraph might be classed with railways and with steam navigation. All were agents of intercommunication, tending to the same important ends; but, of the three, the electric telegraph was, by the peculiarity of its operation, the most wonderful. Since 1839, when the first public telegraph was established, about 14,500 miles of telegraph had been opened in this country; 100,000 miles in the rest of Europe; upwards of 48,000 miles in the American States; and the total extent of telegraph at this moment could not be less than 200,000 miles. On land this most useful discovery had been uniformly successful. Like railways, it had grown—in Great Britain by public support alone—into an "institution." Ocean telegraphy had been less fortunate in its results.

Simultaneously with the rapid advance of these works there had been great progress in another branch of engineering—gunnery, with which civil engineers had latterly become connected. Within the last few years the range of artillery had been doubled, the weight of the gun in proportion to that of the projectile had been reduced one-half, and the capacity for power of the elongated, as compared with the round shell, had been more than doubled. This great advance in the destructive power of cannon had rendered most of the old fortifications useless. As ships were being clothed in iron mail, so it seemed probable that iron would be largely used in modern fortifications, and for embasements that material offered great advantages. Forts might, in some cases, be built principally, if not wholly, of iron; and Mr. Hawkshaw hoped it would be adopted for the superstructure of the large sea forts at Spithead, the construction of the foundations for which had been entrusted to him.

Having noticed some of the advantages that might result from a greatly improved quality of iron, or a cheap manufacture of steel, or of a metal approaching steel in character, including the possibility of increasing the size and power of cannon, of constructing bridges of greater span, and of reducing the at present, unwieldy size of paddle and screw shafts, crank axles, and other portions of all sorts of machinery—attention was called to the great facilities afforded by the use of iron cylinders, in sinking and securing foundations.

There was one other subject connected with mechanics, which had hitherto been barren of result—the discovery of a new motive power—for the steam engine remained the only tame giant that was usefully subject to the will of man. So long as motive power was to be obtained through the intervention of heat, or until a cheaper fuel than coal could be found, it seemed improbable that the steam-engine would be superseded by any other machine, though it would not be safe to predict that considerable improvements might not be made in the steam-engine, or in engines to be worked by coal.

In conclusion, the President observed that engineers might feel, when laboring on public works for facilitating the intercourse of nations, that they were not merely conquering physical difficulties, but were also aiding in a great moral and social work, for it was distance and separation that led to misapprehension and prejudice, to ignorance and mistrust, to rebellion and war.

At the monthly ballot, the following candidates were balloted for and duly elected:—Messrs. A. L. Light, J. R. Mosse, and J. C. Smith, as members; the Lord Richard Grosvenor, M.P., and Messrs. H. A. Hunt, Jnr., and H. H. Keeling, as Associates.

THE LATE M. C. WYATT, SCULPTOR.

WE have to record the recent death (at the age of 84 years) of Mr. Matthew Cotes Wyatt, whose name was well known nearly half a century ago as one of the foremost sculptors of the day. The late Mr. Wyatt was the son of James Wyatt, Surveyor-General under King George III., who lies buried in Westminster Abbey. He was born in 1777, and was educated at Eton, where he was the contemporary of the late Marquises of Londonderry and Anglesey, and of Lord Stuart de Rothesay. At the age of nineteen he was employed, under the immediate patronage of King George III., in the execution of several works of art at Windsor Castle; but his first public work was the memorial erected at Liverpool in honor of Lord Nelson, from his design. Mr. Wyatt also executed the cenotaph in St. George's Chapel, Windsor, to the memory of her Royal Highness the Princess Charlotte. He executed equestrian statues, including those of the Duke of York, Field-Marshal the Marquis of Anglesey, and lastly, the Duke of Wellington. Mr. Wyatt also executed the monumental group erected to the memory of the late Duchess of Rutland in the family mausoleum near Belvoir Castle. But, perhaps, in no single subject did Mr. Wyatt ever succeed more thoroughly than in his statue of "Bashaw," the favorite Newfoundland dog of the late Earl of Dudley.

Another of Mr. Wyatt's most celebrated statues is that of a charger encountering the dragon, which was commissioned by King George IV., for a group of the patron saint of the Order of the Garter, and was placed by his Majesty's command in St. George's Hall, at Windsor. The horse for the equestrian statue of King George III., at the east end of Pall-mall, was also designed and executed by Mr. Wyatt, whose life had been so prolonged that he had seen a race of artists of the Victorian era arise, to claim their share of the popular fame in which he had himself participated so largely under "the Georges."

MR. SMIRKE'S LECTURES ON ARCHITECTURE AT THE ROYAL ACADEMY.—I.*

SUCH, however, as I have remarked, was most certainly not the opinion of the practice of the sculptors of the seventeenth century. M. Angelo had, in the palmy days of art, made his Moses look like no common piece of humanity, but rather like a sculptured fragment of rock, in solemn repose and instinct with supernatural dignity, whilst the Patriarch, when treated in the naturalistic school of the degenerate period I now refer to, never failed to be represented as a remarkably active impetuous old man, admirable chiefly for the violent development of his muscles; throwing himself into very unseemly attitudes, and striking the rock with his rod more like an excavator than a patriarch. Such also is the general character of their architectural sculpture.

The Apostles and Fathers of the Church were men upon whom we should be taught to look with reverence by the quiet dignity of their mien, and by that deep intellectual abstraction which is best represented by a steady composure of manner and general absence of energetic action. But where are we to seek for such examples of architectural sculpture from the chisels of the eminent masters of the fantastic school of this period? On the contrary, the Holy Fathers are made to look like posture-masters performing for the public diversion, and are seen on their pedestals, throwing their limbs about and ruffling their drapery in a way utterly subversive of that personal dignity, which, as I have remarked, seems to appertain to their character.

It is not to be wondered at that when taste in sculpture had reached this bathos our own art should have been dragged down with it to the same level. Indeed, there is, I think, good reason to apprehend that far too intimate a union had unhappily subsisted between those two sister arts.

So long as a fine taste and a high æsthetic feeling prevailed no danger came, nor could come, from the cultivation of both these arts by one mind; indeed it was the glory of our art to be intimately allied to the sister arts. But when that truth of feeling and nicety of judgment had passed away which taught those who practised both arts to discriminate well between the special requirements of each, a fusion was the result mischievous to both, but which was more particularly injurious to our art, for a sculpturesque treatment of architecture is likely to lead to far graver errors than an architectural treatment of sculpture. The latter may be liable to become cold, rigid, formal, and even unnatural; but the former is sure to become, as indeed it did become, insufferably lax and vicious, violating all the proprieties of our staid and sober art—an art which can never indulge in capricious without great risk to character and certain loss of dignity.

To say the truth, without however meaning the slightest disparagement of the sister art, I would express my belief that most of the errors of architecture in its decadence, may be traced to the injurious influence that sculpture exercised over our art. The habit of a sculptor's mind would naturally lead him to exercise his inventive faculties in designing and modelling out of the plastic material with which he is most familiar, forms and combinations of forms that would produce picturesque groups, and an ornamental, or at least pleasing arrangement of lines, and of chiaroscuro, and when he comes to execute his conceptions in stone or marble, he would of course seek to construct his work, if not out of a single block, at all events in as few as possible, because joints, and especially bed-joints, he is of course always anxious to avoid or conceal. All the proprieties, therefore of masonic construction—the sound bonding together, and truthful bedding of stones; the avoidance of false bearings, and all such like considerations are entirely foreign to his art, and are in fact subjects which never, or rarely, demand his study, nor even need his attention as a sculptor. Hence it is, probably, that we find that the sculptor of the seventeenth century, when he produced works of architecture, was very prone to treat his buildings, however large, rather like magnified copies of small sculptural models, than as purely architectural works; that is to say works built up on the true principles and according to the known rules of good architectural construction.

When we call to mind the practice so prevalent, and so popular, at the period of which I treat, of erecting in churches, huge architectural pageants, of a most ostentatious character, but of very slight and temporary materials and construction, as chapels ardentes, and catafalcos, when the funeral obsequies of some high ecclesiastical or political dignitary were performed, it seems not unlikely that this prevalent fashion on which, as it is well known, artists of highest eminence, were often engaged, conducted to, or at least accelerated, that degraded character of architecture which we so much deplore, and which so injuriously influenced our art in subsequent times.

Those vast architectural shams, the catafalcos, were put together by the flimsiest contrivances; there was, of course, a lavish superfluity of statuary, for it was of mere lath and plaster, and the drapery was often—I believe usually—real linen steeped in glue and whiting to give it a fictitious rigidity, and something of the superficial aspect of stonework.

By such like artifices it became easy to "body forth" for a day's ceremony, some "baseless fabric of a vision," highly picturesque and imposing perhaps, indeed, when treated by men of genius and ability, very striking and even magnificent; for, as I have said, men of the highest rank in art were not, in those days, averse to lend themselves to these ephemeral productions.

In presenting such unreal mockeries to the view, masonic proprieties were neither required nor regarded. The boldest and least fastidious practitioners would probably indulge and amuse their fancies in realising the semblance of impossible structures; and as it was just as easy and inexpensive out of the lath and plaster, or clay and stucco in which they worked, to present to the devout and admiring congregation a galaxy of clouds and glories, and to group together all the cardinal virtues, and the whole hierarchy of saints, as it was to exhibit the most gorgeous domes and the richest colonnades, it is not to be wondered at that the productions of the two arts got irretrievably intermingled and confounded, as well as corrupted.

That such a practice or fashion, prevailing among a people of strong æsthetic feeling, but of lax principles of taste (and such were the Italian people of the seventeenth century) should lead to a similar style of designing in works of a more permanent character, seems natural and almost inevitable.

First in interior architectural design we should expect to find, what in truth we do find, that altar pieces, baldachinos and monuments, became strange medleys of the two arts, although worked out, perhaps, in real marble and brass; and then the vicious tendency would necessarily spread itself to exterior architecture.

NORTH WALES LUNATIC ASYLUM.—Messrs. Lloyd, Williams, and Underwood have prepared plans for increasing the accommodation of this asylum to hold an additional 200; 100 males, and 100 females. The Commissioners of Lunacy have approved the designs, and the work will probably proceed in the spring. The kitchen of the present building having been found rather small, a new one with every modern improvement and convenience has been erected from the instructions of the same architects.

I think that it may be said with strict truth that exactly in proportion as this sculptural spirit pervaded architecture, so that art became deteriorated. It has been truly said by a high authority from this place, that painting and sculpture each excite our admiration the most when their special characters are kept most clearly defined, and when each art limits itself to the doing that which it is by its nature best qualified to do. Sculpture can very imperfectly represent distance, and should, [therefore, avoid as much as possible attempting backgrounds. Painting, on the other hand, is peculiarly competent to produce such effects, by its power to represent space and distance; and therefore, the painter who places all his figures on the same plane, does not avail himself fully of the capabilities of his art. So, also, the painter abandons one of his highest privileges when he neglects to use color, whilst the sculptor who uses color (unless he does so with infinite caution and exercises great moderation and abstinence), runs a serious risk of turning his statues into dolls.

Our own art is amenable to the same law. It is always most triumphant when it attempts to do that only which it is its special province to do. Thus then, to apply our remarks to the subject in hand, I should say with great confidence that the architect who so designs his building as to render it doubtful whether sculpture may not legitimately lay claim to the work as its own, is a traitor to his art, and despoils it of its birthright.

Many instances of such self-debasement present themselves among the works of the degenerate days of which I treat. It seems an ignoble task to hunt up for criticism and condemnation such examples of the abuse of genius; but such is the task I have imposed on myself, Italy well earned the honor of having been the garden in the soil of which were nurtured all the most beautiful productions of modern art; but it was unfortunately in that same too fertile soil, that with greatest exuberance sprang up those wild extravagances, which ultimately brought so great discredit on the arts, and on none more so, perhaps on none so much as on architecture.

I believe that it is to that fatal facility, which characterised the practice of all the three arts at this period, that we must mainly attribute their common decline. Wholly wanting in the thoughtfulness and deep feeling of Raffaele, and of some who preceded, as well as of some who immediately followed him, the painters sought for the most part, gorgeous and showy effects, at the expense of all the higher qualities of their art; so, as I have already remarked, the sculptors of this declining age designed impetuously and executed dexterously, but the sentiment of their art had evaporated, and its greatness had gone; — and so, to return to our own art, the architects of the happier, and earlier period, were enthusiastic without wild extravagance, refined without pedantry, and always knowing well when to refrain from and when to indulge in the graces of decoration; none knew more thoroughly than the later, more advanced, quattrocentists *how* and *when* to give a zest to their work by the most charming ornamentation; whilst none appear to have known better than they the value of breadth, simplicity and even of perfect plainness, when their good taste and judgment prompted an abstinence from ornamentation. But I have on former occasions dwelt sufficiently on the merits of the masters of that great period, and have already endeavored to urge on you the careful study of their works. I name them now, that you may feel more sensibly the contrast presented by the architecture of the degenerate age which followed. It is my aim to deter you from the evil examples set us by the licentious throng of the seventeenth century by holding up their errors for your reprobation and rejection. Through the ignorance of some, the contumely of others, and the loose habit of speaking common enough to most of us, the term "Italian architecture" is apt to be applied to buildings of the most diverse and opposite character. It is an instance of the same laxity of speech by which styles of the utmost contrariety, from the simple, austere, and honest architecture of the early Rhenish buildings down to the florid extravagances of Adam Kraft, have all been indiscriminately classed under the one large, unmeaning, and inappropriate term "Gothic." It is through the same thoughtless and perhaps ignorant way in which the general term "Italian" architecture has been customarily applied, that gross injustice has been done to works of the highest quality.

The vague and superficial knowledge, both of some of those who have written and of those who have spoken on our art, has too often led them to place under the same category the beautiful works of Bramante, Raffaele, and Giulio Romano with the truly barbarous architecture of Borromini, Fischers, and too many others. The Italians were, as I have already said, themselves the first corruptors of the Italian style; and among those corruptors Borromini stands out in strong relief as a prominent delinquent; for, as he was one of the most reckless practitioners, and one of the most sinful contaminators of style, so was he one of the most active and prosperous. Prosperous he truly was; for with that fatal facility on which I have been animadverting, he occupied a long course of practice in spreading over Italy a numerous and conspicuous progeny of ugliness. Prosperous, however, he was not to the end. By a kind of poetical justice which does not always attend upon the guilt of offending artists, he died miserably, the victim of jealousy and envy. Bernard Fischers was another instance whom I have adduced as one of the false lights of this vicious period. Vienna, to this day, is, in its public buildings especially, distinguished by the bad taste of Fischers, and I know no city so sadly disfigured by the school to which he belonged.

Milizia is a cantankerous critic, it is true, but he is perhaps justified when he condemns Fischers' triumphal arch at Vienna as "un capo d'opera di stravaganza." The wildest disciple of Borromini, he says, could not have invented a more capricious and irrational design.

I revert, now, to the question, what was the cause of this great and general degradation of art in Italy? It may be that the political and social condition of that country had for some time been degenerating; whilst other, more northern countries, were rising into wealth, and advancing in the political scale of Europe. Yet, it cannot be said that political preponderance will always be found on the same side of the balance as æsthetic excellence.

We might readily point, in the history of Europe, to notable instances of the contrary.

For example, I am aware of no wonderful development of artistic taste having accompanied the brilliant epoch of Frederick the Great, or the extraordinary political ascendancy of Charles the Fifth. Going back to an earlier period, we shall find that in mediæval times, when the social and political condition of Europe was very dark, and when, in the language of an old contemporary chronicler, "nobles and bishops built castles, and filled them with devilish and wicked men, and oppressed the people;" at that very period, foul, as it certainly was, with

most of the vices which disgrace Christianity, a school of art existed which has been advantageously compared by many with that of the Greeks.

It is clear, therefore, that there are more subtle influences which will, at least sometimes, operate favorably for the development of art, besides the accumulation of mere material wealth and political power.

Neither will peace, alone, of necessity, bring æsthetic excellence among other blessings in its train, as we are very apt to say, and very willing to believe, when we would paint the horrors of war.

The Greek states, for example, brought the fine arts to a climax of excellence never since fully attained, although they were for ever engaged either in warring on each other, or in preparing and defending themselves against extermination from barbarian hordes.

So the Italian states, among whom art received its second birth, were constantly plunged in internecine wars. How often were the great masters of our art called away to superintend the erection of gloomy fortifications, and ponderous, unseemly, loop-holed walls, for the protection of those very cities which they were engaged in beautifying! How often were great and glorious works of art arrested in mid progress by the incursions of neighbouring rivals, or by the threatened devastations of foreign hosts, or by the exhaustion of the public purse consequent on these deadly strifes!

These instances, which might be greatly multiplied, are sufficient to show that a stormy political atmosphere is by no means of necessity inconsistent with the existence of a highly excited state of artistic ardour.

I would not, however, for a moment be supposed to pledge myself to the paradox that war is favorable to the cultivation of art. Very far, indeed, from that is the fact. All that I would wish you to infer from the remarks which I have just been making is, that the arts have been found to prosper notwithstanding war. But there is one condition which I believe to be clearly and positively essential to the permanent well-being of the arts, and that is, public prosperity. I suppose it to be impossible to cite an instance of the general decay of the material interests of a country not being accompanied by a corresponding degradation of the fine arts in that country; whilst, on the other hand, the sound, social prosperity of a people will generally be found to be accompanied by an elevation of their standard of taste, as well as by a widely spread appreciation of the fine arts.

The proudest works of mediæval France date about the period when St. Louis, by his wise government, raised the character and consolidated the strength of his country. In England, the rule of Edward III. marks the periods of the highest point of excellence to which Mediæval art reached in our country, and precisely that warlike and heroic period was the most brilliant in the political annals of our middle ages.

I need not do more than point to the age of the Medici, in Florence, as the period most embellished by the fine arts, and as the period when the Italian Peninsula stood foremost as the most politically eminent among all civilised nations; and we have already seen, from the retrospect I have been taking of the architecture of the Italian Renaissance, that the debasement of the three sister arts was simultaneous with the decay of Italian political greatness. It is not for me to attempt to explain these coincidences. It needs a larger and far clearer view of the philosophy of history than that to which I can pretend, before I can presume to lay open the causes of these phenomena, the existence of which is all I can venture to assert.

Perhaps, too, the inquiry into those causes would hardly profit us here, for it belongs rather to the domain of the political economist, than to that of the artist. No doubt every ingenious mind must feel an interest in these general views, but they can scarcely be expected to bear us much fruit, nor to afford us practical rules of conduct in our search after æsthetic excellence, a search which should ever be uppermost in the artist's mind, be he student or professor. To trace the progress—not the occult causes—of decay in our art, has been my chief object in the few desultory remarks which I have this evening addressed to you. It is but a sorry theme, and I may be blamed, perchance, by some for having lingered so long among these ruins of a fine art, and for having sauntered so long upon the banks of that stream of polluted art which deposited its slime over so wide a portion of Europe, and during so long a period; whilst I might, with so much more pleasurable a feeling, have been leading you on to admire beauty amidst the charms of a happier age. But it is my conviction that much benefit is to be derived from the bold and unhesitating denunciation of whatever we must recognise as faulty. There are scum on stones; whether they be fashioned by the hand of a master, or rudely hewn by the chisel and mallet of a 'prentice hand. The diagnosis of disease is, in truth, best studied, not in the healthy, but in the disordered subject.

I have laid bare before you some sad cases of such disordered subjects this evening. It was, as you well know, the Spartan philosophy to deter the youthful mind from vice by exhibiting openly to the public gaze the unhappy and repulsive results of vice.

All that I ask of you is that you will note, and heedfully observe, these errors of our art, even whilst you pass them contemptuously by, and that you will study them well, for the mere purpose of propounding them as objects which neither love of novelty, nor the attractions of singular ingenuity, or of great technical skill, should ever tempt you to imitate or to repeat.

HOUSE TELEGRAPHY.—At the *soirée* given by the Professors of University College Messrs. Silver and Co. exhibited working models of a telegraph invented by Professor Wheatstone, F.R.S. The apparatus is compact and portable, and although not occupying more space than a 9-inch cube, contains all that is necessary for receiving and transmitting signals, and for producing a current of electricity effective over 150 miles of line. The signals are made by the pointing of an index to the letters of the alphabet, numbers, &c., painted on a dial in Roman characters, and are, consequently, intelligible to all. In the transmission of signals all that is necessary is to depress the key opposite the letter or figure to be transmitted, and produce the current.

EDINBURGH MASTER PAINTERS' ASSOCIATION.—This Association has, like our London Painters' Company, established the practice of giving annual prizes for the best specimens in imitation of woods, &c. A number of specimens were exhibited last week at the rooms of Messrs. Dowells and Lyon, 18, George-street. Several of these, considering that they were executed by young apprentices, were highly creditable. The committee met in the evening, when prizes were awarded to the following:—Imitation of woods—1st prize, William Shaw; 2nd prize, Thomas Quigley. Lettering, plain and shadow—1st prize, James Duffy; second prizes, Thomas Quigley, John McCabe, and George Darling.

ON THE CONSERVATION OF ANCIENT ARCHITECTURAL MONUMENTS AND REMAINS.*

NOTHING can be more delightful and instructive than this class of investigation. One sometimes finds objects of the greatest interest and unfolds designs of the greatest beauty and originality, of which not a trace was before visible. Were it not for this, the work of restoration would be almost unmitigatedly painful, from having constantly to meddle with and to replace genuine, but hopelessly decayed, work; these discoveries, however, and the beauties they unfold, afford a delightful and consolatory compensation.

How doubly distressing, then, is it to see evidences of this kind discovered, but ignored and destroyed without one hint being taken from them, as is too often the case.

After animadverting, however, upon our own misdeeds, I think I may be excused in speaking somewhat plainly as to the fearful loss of authentic work of the most precious, indeed, of the most *inestimable* value, which is going throughout the length and breadth of that country which boasts itself to have been the birthplace of Pointed architecture, and where, if that high claim can be established, it follows as a necessary consequence that every original fragment, and every authentic detail, or—more correctly speaking—the originality and the authenticity of every fragment and of every detail, should be guarded with a jealousy proportioned to their value as the most trustworthy and the most genuine illustrations of the rise and development of that wonderful style of art.

It is perfectly inexplicable to me how the very same persons can at one time bring cogent arguments to prove that their country was the nursing mother of Medieval art, and at the next should deliberately, and without necessity, take down from her noblest architectural monuments original details of the most exquisite description which imagination can picture, and which have suffered comparatively little from time, and replace them by modern copies. Yet this is the course of proceeding going on from one end of France to the other—and that not by one architect in particular, but, in a greater or less degree, by all the architects who are engaged in the restoration of the ancient monuments of France.

In that country we have to applaud the generosity of the Government in undertaking on so magnificent a scale the restoration of its ancient architectural remains. We have not, as sometimes with ourselves, to lament the employment of persons of dubious capability; for the works are generally in the hands of men of the greatest eminence and of undoubted skill and knowledge; nor have we to complain of any want of artistic power in the carrying out of the works, for in this we must acknowledge ourselves to be in many cases surpassed. What we have to lament, to deprecate, and to protest against is, that inexplicable absence of appreciation of the value of the authenticity and of the actual *bona fide* genuineness of old work, which leads them to reject without scruple or remorse the most charming original work for some mere trifling defect, and to feel perfectly satisfied with a copy which, however skilful, must be lifeless from the very fact of its being a copy, and which, even if as good as the original, must be utterly devoid of the interest and historical value which attached to it. The extent to which this feeling, and the course which results from it, extends itself is as lamentable as it is inexplicable, and absolutely threatens to replace half of the ancient monuments of the country by mere copies of them. True it is that these copies are admirable in execution, and careful and studious in their correctness; but who cares for a copy if he can get the original? or who will ever look at the details of the French cathedrals as exponents of Medieval art, when they know them to have been executed in the nineteenth century? And it is not the examples of Pointed architecture alone which are being thus tampered with but even the curious Byzantine remains in southern France and the classic monuments at Nismes. When I was preparing, some time since, a lecture for the Royal Academy on the rise of Pointed architecture, I had a great desire to see a drawing of any capitals which might exist at Périgueux, and on making inquiry of a friend, who had just been there, he said, "Oh! I could have got you one if I had known, for the old ones were lying about among the old materials." One hears a story of an American who, after looking at the new works always going on at the Coliseum, remarked, with very just irony, "It'll be a very fine building when it's finished." And I learn from our excellent secretary, Mr. Lewis, that the very same thing is going on now at the Amphitheatre at Nismes!

Even Carcassonne, so famous and so interesting as a city—almost deserted before the close of the middle ages, and consequently a wonderful genuine specimen of a Medieval city—is, as I learn from Mr. Lewis, being renewed and made into a (no doubt very learned) model of that of which it was the dilapidated original!

A visit to the Hotel Cluny affords a practical commentary upon this system of restoration by renewal. We see there capitals from the Sainte Chapelle of an exquisite subtlety of conception and sculpture—such as to bid defiance to any one who would think of transferring their spirit to a copy—and yet thrown aside and laid on the grass-plot, in all weathers, though to the casual observer almost as perfect as if new; one sees there the real angels whose counterfeit blows the trumpets of the Resurrection over the great portal of Notre Dame; one sees the central pillar of one of the same portals looking nearly as well conditioned as its modern supplanter; one sees also balusters from the parapets of the Sainte Chapelle as good as new; and many other exquisite details rejected from the restored edifices—one knows not why. The stone-ysrds near many cathedrals tell the same story. Indeed, wherever a great restoration is going on, you may see the genuine old details, often scarcely corroded by time, lying in rejected and neglected heaps hard by.

Now let me ask, in the name of good sense and good feeling, why the great learning, skill, and judgment of the (often illustrious) architect to these works is not rather directed to the conservation *in situ* of every fragment of the noble architecture which they understand so thoroughly, rather than to its supplantment to make way for mere copies which, however admirable, possess no real value as genuine exponents of the style? If they would take the contrary course, I can aver without fear of contradiction, from the talent and learning they display, that their works would be worthy objects of the pride of their own countrymen and of the gratitude and admiration of every lover of Medieval art, instead of being, as now, causes of regret and disappointment to all. But, it may be asked, what business is this of ours? Why do we not correct our own errors, and leave architects of other countries to do as they like? I reply, that the French architects and art-historians, by showing (whether we fully admit it or no) that theirs is the mother-country of Gothic architecture, have thereby made its

productions the property of Europe and of the world; and that, on their own showing, all lovers of Gothic architecture have an almost equal claim upon them for their authenticity and their conservation.

I have dwelt so long upon the principal heads of my subject that I must but slightly touch upon that which remains: I mean the preservation of the miscellaneous remnants of antiquity, which form my third class.

These are, more than any other, subjected to the constant inroads of Vandalism. Even the reverend conservators of our cathedrals care little for the fragmentary remains by which they are surrounded, and often rather wonder at the weakness of those who lift up their voices in their favor. The very same man who takes an enlightened interest in the preservation of every portion of the church cannot be brought to care about the equally interesting though simpler structures, whose vestiges are intermingled with their own residuary houses, and would have no scruple in destroying the most interesting antiquities to provide for some passing matter of convenience.

At Worcester it is only a few months since the ancient Guestern Hall was threatened with destruction. At Ely the huge Abbeys Barn was destroyed only a few years back, and nearly everywhere the same spirit may be found to be at work. It is the duty of an Institute like this to protest against it, as they have lately to their honor done in several kindred cases.

One can hardly expect better things of a town council, when chapters of cathedrals set the example; but one must, in passing, protest against the deliberate barbarism which has within a few years destroyed the curious old town-halls of Hereford and Leominster.

Our country villages, and the country itself, are full of small fragments of ancient architecture, often not of very early date, but of most valuable character, and which are every day threatened by the hand of innovation. I refer not only to works of high antiquity, but to timber houses, old brick (or other) chimneys, shafts, old gable-houses of stone or brick, and a thousand other fragments of old buildings, which add so much to the character of our villages, &c., and are also so suggestive for rural architecture. These ought to be jealously preserved and watched by those who have it in their power to do so. Village and churchyard crosses, the remains of old domestic architecture in our towns and cities, old manor-houses, hospitals, schools, colleges, &c., &c., and a thousand other classes of building, demand equal care; and, last of all, I would mention old bridges, which are far more numerous than one would suppose, and which are less seen than most classes of antiquities, from the fact that we pass over, and, therefore, cannot get a view of them. These have very frequently been preserved intact on one side, and widened on the other; a process one cannot object to, as the roadway which they provide is usually too narrow for our present uses. Though not great engineering works, they have a noble character, and occasionally attain to considerable span; as in the case of one at Durham, which approaches 100 feet. Amusingly enough, a modern engineer, in widening it by an arch of the same span has failed in making his work stand so well as the old one.

I have, however, made my paper far too long, and must sum up briefly, as follows:—

I. Our old architectural monuments are of the utmost value and interest to us as Englishmen and as architects, and their conservation is a matter of vital importance.

II. What with neglect, Vandalism, natural decay, and ill-judged restorations, the existence, integrity, or authenticity of these invaluable remains is threatened from all sides, and fearful inroads upon them are every year being made.

And finally, it is the paramount duty of an institution such as ours—the only one of a permanent character by which architecture is represented—to take the initiative in laying down, in conjunction with other architectural and antiquarian societies, a code of rules for the treatment of buildings requiring restoration, and to take such measures as their united wisdom may suggest to promote the true, faithful, and authentic conservation of these monuments and remains.

In conclusion, then, I beg to propose that a standing committee be appointed for this purpose, and that they be empowered to act in conjunction with, and to communicate with other societies, with a view to secure their co-operation in carrying out this most important object.

COMPETITION FOR THE NEW HOUSES OF PARLIAMENT AT SYDNEY.

WE learn that the designs for the new Houses of Parliament at Sydney, and of which twenty-one were sent in, have at last passed under the examination of the Board of Commissioners, and that for two of them premiums have been awarded. On the 9th of November the Commissioners met, and were unanimous in their adjudication. The first premium of £600 was given for the design, "I bide," and the second of £300, to "Hora e Sempre," the first is by Mr. William Henry Lynn, of Sackville-street, Dublin. It is in the Gothic style, its most prominent feature being a succession of lofty towers, including a campanile; the high pitched roof and windows being highly ornamented. The chief merit of the design is said to consist in the relief afforded by the broken outline, rich effects being produced by frequent and ornamented projections. The cost of carrying this design into effect is estimated by the colonial architect at £642,205.

The architects who obtained the second premium, are Messrs. Stent and Laver, of Great Portland-street, Portland-place. They sent two designs, the one Classic and the other Gothic. The Classic design presents a row of Corinthian columns, with massive entablature and pediment, and crowned by an octagonal tower. In the Gothic design there is a central tower.

In considering their award in this case, the Commissioners regarded both designs favorably, but actually gave it for the last named. The estimated cost of carrying out the Classic design is £650,641, that for the Gothic £505,113.

Messrs. Stent and Lavers are the architects for the Parliament buildings now being erected at Ottawa, Canada West, the foundation stone of which was laid, it will be remembered, by the Prince of Wales, in August of last year. Five only of the competitive designs were the production of colonial architects.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post* Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

NASSAUER HAUS, NUREMBERG.

ON PUBLIC MEMORIALS.

BY no works is the state of art in a country more judged of by foreigners visiting our metropolises, than by the last new statue, column, cross, or any other form of memorial set up in our streets. No work of art is more sure to be sought out and visited by strangers and foreigners than is the memorial, of whatever kind, that has been recently erected as a testimony of the respect and gratitude of the nation, to a great and good man, known not only in this country, but all over the Continent, or, perhaps, throughout the world. Everyone that has heard of him (and, perhaps, many have much admired his character, and taken a daily interest in his actions while he was living), is sure to be anxious to see what sort of memorial has been reared in honor of him.

Is it worthy of the man to whom it is erected? Is it worthy of the age which he helped to enlighten and improve? Is it calculated to keep in the minds of those who see it his character, circumstances, and history? If to celebrate an event, and not an individual, does it do so worthily and distinctively? Does it, in fine, as much as possible fulfil in every variety and particular the objects that such a memorial ought to and might fulfil. Such questions, varied as the individuals who gaze at them, but mostly to such end and purpose, either pass silently through the minds, or are given audible expression to by the different classes of spectators; and, according to the answers given to them by the memorials themselves, are the opinions of the thinking men of the day in all countries to a very large extent affected, as to the state of art in the country, and as to the capacity of the people for producing great works of art.

Independently of the public attention naturally called to works of art of this kind, by their association and connexion with men of, perhaps, Continental reputation, or with events of perhaps international importance, public memorials are more open to public criticism, and more liable to be taken as examples of the art-progress of the country, because the sites that are or ought to be chosen, are naturally the best known, the most public, and the most conspicuous—the public square, the public gardens, the public parks: they stand out in front of the public buildings, may be the only object of art in a public park, or erected on the only resting and breathing place in a public crossing in a public street.

But wherever placed they always are objects of curiosity and interest, for some time after their erection, to the inhabitants of the city or town in which they are erected. And to foreigners and other visitors to that city or town, they become from henceforth special objects and things that must be seen, as long as that city lasts. Is it not so with such memorials abroad and in our own country towns that have not been before visited in the minds of those whom I am now addressing? Do not the memorials in the public streets, or in the churches have much to do with the character for art given by each of you, to the country or town you visit? If so, it is an important subject, both to the profession and to the nation. I will endeavor, therefore, to lay before you the principal things, that I consider necessary to be thought of and kept in mind, both in selecting and designing public memorials. I think that the designs for public memorials should always be selected by public competition, by which I mean one open to all the country, and not a limited one, in which some half dozen men are invited to compete.

I have been led to this opinion for the following reasons:—That public memorials, as usually erected, have the special peculiarity of being on a debatable land, between architecture and sculpture, and properly belonging to both; that, therefore, an open, unlimited competition has the advantage of putting before the promoters of the scheme in a clearer and a more impartial way than any other mode the respective merits in that particular case of the treatment of the subject in view, either in an architectural or a sculptural manner, or architecturally designed, combining both; that it affords to those who are to have the management of it and the selection of the mode of carrying it out the opportunity of receiving suggestions as to the peculiar fitness of some particular selection in a special case—happy suggestions, perhaps, that may altogether alter the mode in which the money subscribed is to be spent, and yet more fitly show respect to the memory, and hand down to posterity the peculiar characteristics of that peculiar man, than any other mode that could be devised.

I think it well that the committees in these cases—but in these cases, of course, only—should not too closely specify the peculiar mode of structure that they propose to raise.

I say that the precise kind or form of building should not be too closely specified only for this reason, because I am of opinion that, were the question whether architectural or purely sculptural memorials should be selected decided after receiving the designs, and not before, that in a short time those erected for the future would be much improved, and we should have a much greater chance of seeing in them that happy mixture which we now seldom see, and which I cannot but think desirable.

Public memorials may consist of any out of a great variety of structures, many buildings that are not necessarily so in themselves becoming so by being selected as suitable in peculiar cases; and few of us can otherwise than think that in raising some useful institution or public building, devoted to a special purpose, but of a nature to be useful to and promote the prosperity and wellbeing of the nation at large, the respect and gratitude of the nation are better shown than in any other way—that in this way, more than in any other, are the peculiar merits, peculiar labors, and peculiar character of the man recorded to whose memory and honor it is erected.

Can you better honor and show forth the peculiar character, labors, and merits of a scholar than by founding a school or college and calling it by his name?—or a philanthropist or public benefactor than by founding a hospital, baths, or other building of public use and benefit?—or by furthering in any manner the same objects which he in his lifetime labored to advance in his native town, or the town in which he dwelt and which he loved to improve and benefit, or in a place in which it is more wanted—a deviation from the ordinary rule which you know would be in accordance with the spirit in which he acted when he was alive?

So we will first consider the peculiar modes of treatment necessary to be kept in mind in this mode of raising a memorial to a public man by raising a building and institution of the kind that most harmonises with his tastes, objects, and labors during his lifetime.

In this case we must take care not to lose sight of the special object of the founding, in the useful objects of the building. A statue of the person to be kept in remembrance should be placed in a conspicuous position in the building, and

in the lower portions bas-reliefs should be introduced, where they can be well seen, representing his struggles, his labors, and the peculiar good he did; and the interior may very appropriately have among its decorations, views of the house in which he was born, the places most associated with him as the scenes of his successes or his useful labors; while other frescoes on the walls may be well filled with a series of historical scenes, in which he acted a prominent part. While, if he was a successful inventor, or helped materially to develop or improve some useful branch of manufacture, illustrations of the peculiar invention, peculiar mode of manufacture, and representations of the particular art-manufacture produced, may, if skillfully treated, help to fulfil the historical and memorial purposes of the building, and also to vary and enrich its decoration.

The commemoration of any great and good public man, by a single statue representing him, executed in either marble or bronze, and placed on a pedestal, is a custom which we find among the Greeks and Romans, and which we have derived from the Renaissance architects, who revived the custom of the Romans with their architecture.

In the various museums at home and abroad, we find some very beautiful examples of such, of emperors and citizens, graceful and dignified, mostly, however, by Greek artists. In the Museum at Naples are some fine examples of Roman equestrian statues. The Renaissance sculptors took these as models; as, for instance, Donatello is said to have taken the celebrated bronze equestrian statue of Marcus Aurelius, in the Capitol at Rome, as his model for his fine statue of Erasmo da Narni, commonly known as Gallemeata, executed for the Signoria of Venice about 1450. This was the first equestrian statue of modern times; this, a cast of which is to be seen in the Crystal Palace, is a fine example of its class, and one well worthy of study. Our own Charles the First is another early and fine example, as is, also, the pedestal of the artistic treatment of that important member of this form of memorial.

The designing and treatment of the pedestal is one of the weakest points in our modern sculpture memorials. Sculptors at the present time, seldom or never being employed as architects, and, therefore, not considering it necessary to study architectural composition, as did sculptors in the Renaissance times, their pedestals generally show this, greatly to the detriment of the whole composition. As commonly erected in our squares and streets, a single statue on a pedestal, without anything on that pedestal to indicate what the occupation, attainments, and achievements of the person represented were, always appears to me but a bare and empty way of commemorating a great man, or of representing the creative art of the country. I would at least add four bas-reliefs to it, if nothing more could be done; and in those four bas-reliefs much could be shown, of why the statue of that man was raised on the pedestal. Thus enriched and increased in value as a memorial structure, a naturally and yet majestically designed statue is, when placed on a really beautiful and elegantly proportioned pedestal, a graceful and pleasing ornament in the public street.

What a pity that so fine a statue as the Richard I., of Marochetti, should be on so miserable a pedestal; let us hope that the English copy of Foley's Hardinge will be placed on a pedestal more worthy of so great a work. A pedestal for an equestrian statue requires to be much higher, more important, and of a much bolder character than that at Westminster.

But as the principal ornament in a large space, a single statue on a pedestal is not sufficiently important, and something more of a structure is naturally called for; and then come very conflicting opinions as to what should be erected. Some have been brought up with the idea that nothing is so fitting as an obelisk, which we derived from the Egyptians, who did not, however, themselves use them for this purpose, but being precious on account of being monoliths, and on account of the cost of working and the cost of transport and raising in their places, they were accounted worthy of being dedicated to the gods, and their four sides contained the inscriptions setting forth the name of the King who dedicated them and the deity to whom they were dedicated. The Romans who transported them from Egypt were the first to use them as memorials or pillars of victory. But many, even now, seem to consider that they are the very thing, and that very thing is very often erected; but I must say that, with all respect for the ancient Egyptians—and a very great respect I have for them—though a grand object on certain sites, I am always sorry to see them erected in this country or in other countries for our national memorials, and the votaries of these massive remembrancers seem to me to admit their weak points by adding to them all sorts of devices which have little other effect than that of diminishing their grandeur.

If really elegantly designed and completely carried out, another very favorite form is grand and appropriate, although in its usual form objectionable from being a member of a building diverted from its original use; I allude to the single column with or without statue. The use of this and kindred forms for this very purpose is of very ancient date. In India we find pillars with very beautifully executed capital and surmounted by a lion, erected by Asoka in the middle of the third century B.C., commemorative of his having adopted the Buddhist religion and containing the creed and principal doctrines of Buddhism; Ferosee Shah re-erected one of these as a pillar of victory at Delhi. These are monoliths. In Cabul are two built examples of pillars, rudely imitative of these, probably Buddhist monuments commemorative of some sacred spot or great event. In Roman times we find them in the form of columns similar to those used in the support and decoration of their temples, but with this difference that several of them were ornamented with sculpture. At Alexandria was one erected by Diocletian; at Arsinoë by Alexander Severus, and at Mylassa. All these were Corinthian.

In Rome, herself, are two of the Doric order, that of Trajan and Marcus Aurelius. There is one shown in Mr. Fergusson's Handbook of a very elegant and suggestive form. The shaft is ornamented with a scale-like pattern of leaves, and its base is surrounded by eight statues; it is at Cussi, near Beaum, in France, and probably belongs to the time of Aurelian. Very near akin to these, and capable, I think, of more beauty, as well as being free from the same objections as the pillar, from being an essentially supporting member wrongly used when isolated, are towers, which, from very early date, have been used for this purpose; that is to say, as pillars of victory, in India, by the Buddhists, the Jains and the Mahomedans, and found erected by the latter, wherever their Saracenic architecture prevailed, especially in those countries where the custom had originally existed. At Chitore, in India, is a remarkably beautiful example of these towers, or pillars of victory, built in later times by the Jains; it was erected by Khumbo Itana, to commemorate his victory over Mahmoud of Malwa, in the year 1439.

In China, we find the pagodas erected as memorials. The celebrated porcelain

* A paper read by Mr. RANDALL DRUCE, before the Architectural Association, on 17th January.

tower at Nankin was erected in 1412, as a monument of gratitude to an empress of the Ming family. It is octagon, and 236 feet high, and owes its beauty of effect almost entirely to the brilliancy of the coating of porcelain, with which both the walls and both sides of its projecting roofs are covered.

The second bar padoga on the Canton River is also commemorative; it is a pillar of victory, erected to commemorate a naval victory; so that we see that pillars and their kindred forms have been both used from very early date for this purpose, and also in very widely parted, and different countries; and the Roman examples have been copied or taken as types of many similar memorials in Paris and all over the Continent. In Byzantine times we find them used at Venice, in front of the Doge's palace, and I remember a very beautiful little example of Italian Gothic work in one of the streets of Florence, supporting four canopied niches filled with sculpture.

I do not think that in this country we have been happy in our adaptations of the Roman form, not that they are allowed to have a fair chance, for who ought to judge of the merits of a structure till it is finished? and our Nelson column still lacks its lions. When shall we see them?

But as long as the Classic style was the only one in which this—in itself certainly good and appropriate form of memorial—was supposed to be admissible, it was difficult to do much that was original, or differing much from those already erected; but now, many thanks to a recent example set in this metropolis, we are set free, and columns as varied as the columns in our different churches and other buildings, may, at least, take their turn with other forms of memorials; and with their pedestals, ornamented by bas-reliefs, or supporters—animals, may be, or figures, bases, bands, capitals, and crowning figure, give great scope for skill in design, taste, and sculptural execution. A picturesque form is to be found in Switzerland, which I think is worthy of study: it is a short massive column, with carved capital, supporting a statue of some local hero, standing in the centre of the round or octagonal basin of a fountain or conduit, suggesting the useful combination in the streets of our towns of memorials and drinking-fountains.*

MR. DIGBY WYATT ON THE ARTS IN ITALY.†

THE name of Quintino Sella, the mathematician, economist, and orator, that of one of the most rising men of the present generation of Italians, will ever be held in esteem by his countrymen, if on no other grounds, from the honorable connexion which must always exist between his memory and that of the signal manifestation of Italian capabilities, in an industrial point of view, which will mainly engage our attention this evening—the first made since the yoke which has so long impeded their satisfactory development has been at least partially removed from the shoulders of a race whose attachment to Fine and Decorative Art has become proverbial.

To the Cavaliere Sella, and to his exertions in the Italian Parliament, that nation is indebted for the conversion of an Exhibition, limited, as originally contemplated, to the illustration of Tuscan manufactures only, into one in which evidence, greater or less, according to circumstances, is to be found of the artistic and industrial capabilities of almost every district of that united kingdom; whose existence as such, every well-wisher to the cause of liberty, and every one who honors the ancient traditions of excellence in design still preserved in that favored land, must ardently desire should be preserved.

The task of the critic who would attempt to minutely characterise individual productions, so far removed from the eyes of those he may have to address, as to render impossible any appeal on their parts from his judgment to material evidence, must, it appears to me, be alike unjust to those whose works may be criticised, tedious to those addressed, and too one-sided to be either interesting or profitable. I propose, therefore, this evening to take a broader view of the entire subject of the Italian Decorative and Industrial Arts than I should probably do, if the means of rectifying any errors of individual judgment on my part, were within the reach of those to whom I venture to offer the following observations.

The natural sequence of emotions most readily to be imagined as occurring to an educated Englishman on entering the Exhibition buildings at Florence would be, as it appears to me, somewhat as follows:—Firstly, his memory would revert to those old glories of the days of Florentine independence, of Genoese and Venetian magnificence, and of Roman Pontifical autocracy, in which the fine and decorative arts are known to have reached a pitch of perfection scarcely rivalled in the palmiest days of Greece and of the Augustan empire. He would naturally inquire what those old Italian arts and industries were, how far they co-existed and were united, and under what social conditions they were developed?

His second inquiry would naturally be, how much of that ancient power still lingers in the hands of the descendants of those by whom the original greatness was attained?

The third subject of investigation would probably be, after taking stock of the present, what materials still exist amongst the Italians likely to carry to a higher perfection than has been as yet attained in recent times the arts for which "*Italia la bella*" was once so famous?

Recognising, as no one can fail to do, the retarding influences which have so long operated to fetter and depress the wonted vivacity of that highly imaginative people, it is indeed an interesting problem to endeavor to trace the direction in which a greater degree of personal liberty than they have hitherto been permitted to enjoy may tend to revive those energies which have too long been overshadowed by a baneful condition of social oppression. From her past and her present may thus, to a certain extent, be augured an Italian future.

In all this, doubtless, there must be some moral for us; and the fourth aspect under which any Englishman, anxious for the augmentation of his country's greatness, would naturally regard the present evidences of capacity manifested at Florence, would be to consider what concurrent improvement his countrymen may derive from the lessons to be at present learnt in Italy?

Following this order of investigation, my remarks will be grouped in subordination to these four leading aspects, under which the subject may be regarded. We shall, therefore, consider first—and far too briefly for the grandeur of the theme—what the old Italian arts and industries were.

It appeared to those in whose hands the initiation of the Great Exhibition of 1851 rested, as likely to prove an important element in preparing the way for a

due appreciation of that great display, that a collection of works, illustrating the perfection to which industrial processes had been carried in ancient and medieval times, should be submitted for general study and investigation by the public previous to their being called upon to estimate the relative value of corresponding contemporary processes. Many of those I have the honor of addressing cannot forget the success which attended that Exhibition, inaugurated under the auspices, and mainly through the direct action, of the Society of Arts.

A similar idea seems to have struck the Italians, and to have led to the bringing together a very remarkable collection of specimens of ancient Italian technical art; mainly through the active exertions and public spirit of a Florentine medical man and distinguished connoisseur, the Doctor Guastella, whose energy has already tended to infuse new life into the administration of the Florentine museums. Several of the principal Italian families co-operated in this good work, the proceeds arising from which, it was determined, should be voted to charity.

Within the walls of a large house in the new piazza dell' Indipendenza, were consequently crowded together a great quantity of objects, illustrating almost all those industries with the choicest specimens of which Italy was wont, from the end of the fourteenth to the beginning of the seventeenth century, to supply the factitious necessities of the most highly cultivated portion of the royalty, aristocracy, and rich "bourgeoisie" of Europe.

With such examples of these arts as we may be now thankful to possess in the Museum at South Kensington, it is little necessary for me to dwell in detail upon the classes of objects collected in the Casa Guastella. It may be sufficient to say that bronzes worthy, if not wrought by the hands, of men such as Ghiberti, Cellini, Donatello, Michel Angelo, and John of Bologna, were not wanting. Neither were the finest Venetian glasses, Milanese and Ferrarese arms and armour, Siennese and Florentine illuminations, Umbrian Majolica, enamels of various kinds, goldsmiths' work, silver repoussé work, iron work, niello, medals, lavori di commesso, or mosaics, and coins, cuir bouilli, tapestries, rare tissues, lavoro all'Azzimina or damascening, tarsia, or marquetry, and marble, ivory, and wood carving.

Where so much was beautiful it seems almost invidious to dwell upon points of remarkable interest; but it would be treason to the royalty of excellence to pass over two or three objects especially celebrated in the history of art, and now brought under public notice after ages of seclusion, if not neglect.

The most interesting of all was probably that patera in bronze, which Vasari relates that Donatello worked for the noble Casa Martelli, to show how perfectly it was within his power to rival the exquisite fragments of antique bronze casting and chasing, which in his days were as much the rage among great Italian collectors as Majolica and "vieux Sèvres" have been lately among French and English. As perfect almost as it could have been when it left the hands of that rare artist, this beautiful piece of sculpture justifies all the praises which Cicognara has so lavishly bestowed upon it in his "History of Sculpture."

Another specimen, of little less historical interest, was the bust in marble, representing Marietta Strozzi, wife of Celio Caleagnini di Ferraro, by that great sculptor, who unfortunately died too young to leave much behind him, Desiderio da Settignano. Jealously preserved in the family of her descendants in that palace, the architecture of which, by Benedetto da Majano and Pollaiuolo, has mainly stamped the Tuscan palatial style with its easily recognised distinctive features, there can be no doubt of the true descent of this beautifully preserved work of art.

Another item, small in bulk, though great in artistic value, was also contributed from the same collection—a little key in chiselled steel, ascribed to Benvenuto Cellini, and, if not actually executed by him, eminently worthy of his most dexterous hand, and of all that skill which he appears to have acquired in the workshop of Paolo Arsago, the Milanese.

Probably, as far as unique curiosity is concerned, the most interesting groups of objects in this collection, were the very important series of coins of different Italian cities and mints; the medals of illustrious personages, by Pisanello, Sperandio, Cellini, Pollaiuolo, and others; and a very curious collection of cut and stamped leather work, which the energies of the purchasers for the South Kensington Museum may, I hope, ere this have acquired for our admiration in this country.

Important as the objects in this collection unquestionably were, as filling up the detail of the still-life of those pictures, in which the stately Gonzagas, Medici, Sforzas, Strozzi, and Dorias occupied the foreground, it is of course in the great monuments and permanent museums of the country that we learn to recognise how inseparable the perfection arrived at in these minor arts was from that greater sublimity attained in the noblest efforts of the architect, the painter, and the sculptor.

It is precisely in this union of imagination of the loftiest kind with perfect technical dexterity in art productions, on either the vastest or the most minute scale, that the great strength of the excellence of the finest Italian design in old time consists. All these relies, whether taking the form of gigantic churches, of stately palaces, of heroic works of sculpture, of extensive frescoes, of elaborate furniture, of pottery, glass, and even ornamental leather, show how absolutely indispensable to personal enjoyment art then was.

Every student of the "*Divina Commedia*" must remember the almost passionate terms in which Dante mourns over that transition from simplicity of life and manners to a luxurious indulgence of the intellect and senses, which no sumptuary laws, however stringent, were ever able to subdue. Long and vainly the nobles strove during the fourteenth and fifteenth centuries to preserve for themselves a monopoly in splendor, but wealth accumulating in the hands of the citizens ultimately broke up their ineffectual blockade. How, and with what results, may be traced in the chronicles of Villani and Corio; in the excellent "*Discorso di Guglielmo Manzi sopra gli spettacoli, le feste, ed il lusso degli Italiani nel secolo XIV.*" and in Muratori's grand collection of writers "*rerum Italicarum.*"

Out of the superabundant gains of the industry and commerce of Florence, S'enna, Geneva, Venice, Luca, Pisa, and Milan, and out of the accumulated riches drawn by an all-powerful priesthood from its spiritual tributaries in all parts of the world, one cannot fail to be struck with the very large proportion which was obviously expended in supplying this apparently insatiable craving for beauty. Sums of money which would frighten the nobles, commercial or hereditary, even of this kingdom, were lavishly expended on the great monuments of Italian art. Taking, for instance, such a city as Palermo, we find, even at the present day, not tens, but twenties and thirties of churches lined throughout with marble mosaic of the most costly description. The riches at

* To be continued.

† A Paper "On the Present Aspect of the Fine and Decorative Arts in Italy," with especial reference to the recent Exhibition in Florence," read before the Society of Arts on Wednesday, January 22nd, by Mr. DIGBY WYATT.

St. Mark's, at Venice; St. Peter's, at Rome; the Certosa, at Pavia; St. Anthony, at Padua; and the churches of the Annunziata and San Matteo, at Genoa, appear almost beyond estimation; while not only in monuments such as adorn these cities is the boldest dimension and the grandest scale adopted, but every inch of wall surface, and every piece of church furniture, however insignificant, is made as elaborate as human ingenuity and human hands can make it.

To such an exuberant extent was this apparent craving for enrichment indulged, that where, as happened in many cases, funds were wanting to complete the ambitious designs of the founder of some great monument, his successors, rather than leave the work altogether unfinished, have endeavoured to realise by paint and every kind of ingenious expedient, the effect so ardently desired by the original founder of the edifice. Hence proceed many of those illusive perspectives which almost convert flat ceilings into airy cupolas, and carry out the eye of the visitor in the *salone* or grand apartment of the *piano nobile*, or principal floor of an Italian residence, through apparently interminable arcades, to an exuberant landscape, alive with statues and fountains.

An amusing definition of what an Italian of the sixteenth century understood as indispensable domestic ornaments may be found in a little book written by Castiglione Saba, and entitled "*Ricordi overo Annuastramenti*," for a reference to which, and indeed for the loan of which, I am obliged to the kindness of Sir Charles Eastlake. In one chapter the writer tells us how pleasing to the eye and how necessary are terra cotta by such men as Paganino da Modena; musical instruments by Lorenzo de Pavia, or Bastiano da Verona; that carvings should be supplied by Michel Angelo, Donatello, Alfonso Lombardi (one of the great Venetian Lombardi), and Cristoforo Romano. Antique medals, he says, are necessary, as well as those of Giovanni Corona, of Venice. Verocchio and Pollaiuolo, we are told, should supply the bronzes; and cameos and intaglios should be by Pietro Maria, and especially by Giovanni di Castello.

We may pass over the list of worthy painters given by the author, but not so the terms in which he notices the marquetry works of Fra Damiano da Bergamo, and the armour and glass work, the current productions of Milan and Venice. To fittingly supply such necessities no artist was too proud, and there yet exist, more particularly in the great Florentine collection of drawings by the old masters in the galleries of the Uffizi, ample evidences of the powers in designing ornament, as applied to industrial productions, possessed by artists whose more special fame rests upon that which we habitually contradistinguish from such classes of art, by designating as fine art. To enumerate a few of these may not be unprofitable, by way of directing the attention of young artists to some of the worthiest masters of their craft.

As designers of wood and marble carving we note the names of Baldassare Peruzzi, the great Siennese architect; Giorgio Vasari, Raffaele da Monte Lupo, Michael Angelo, Montorsoli, Guglielmo della Porta, Il Riccio (the author of the magnificent candelabrum in bronze at the Church of St. Anthony, at Padua), Giovanni Battista Trotti, better known as Il Inolosso, Lilio da Novellara, and an artist of exquisite refinement, Francesco Salviati. For stucco work we meet with designs by Giovanni Battista, Cremonini, and Marco da Faenza; and for friezes with those of Gaudenzio da Ferrara, Giulio Campi, and Amico Aspertini. For miscellaneous designs of all kinds we find beautiful studies by Piermo del Vaga, Francesco Zuccheri, Polidoro da Caravaggio, and Prospero Fontana. Cellini, Bernardino Pochetti, Giulio Romano, and many others, brought their great accomplishments to bear upon the production of beautiful metal work, while Pellegrino, Tibaldi, Matturino, Morto da Feltro, Giovanni da Udine, Baceniacca, Pinturicchio, Pietro Perugino, and many others, shone in arabesques and cognate descriptions of design. Their ability indeed, to minister to the smaller wants of the great Italian nobles, led, in many cases, to the artists so exercising their lesser talents (if they may be so described) receiving commissions calculated to bring out their capabilities in the loftiest directions.

Any one desirous of tracing the important part which the requirements of industrial art played in the lives of many of the most eminent Italian artists, and which I cannot now do more than point to, may find ample materials awaiting his investigation in the autobiographies of Ghiberti and Cellini, in the writings of Vasari and Baldinucci, in the "*lettere Senese*" of Della Valle, in the *Italienische Forschungen* of Von Rümour, in the *Beiträge zur neuern Kunstgeschichte* of Forster, and last, not least, in the collections of original notes and documents illustrating the history of Italian art, by Gaye, Gualandi, Carlo Pini, and the brothers Milanese.

Did time permit, I would willingly dwell in detail on mosaic, sgraffito, instarsiatura, fresco, and gesso painting; terra cotta, Majolica, stucchi, niello, glass making, and others of those arts, transmitted by the curious MS. treatises known as "*secreti*" from generation to generation, in which Italy so long enjoyed a monopoly of celebrity, if not of actual production; but I feel that the second branch of our inquiry this evening is too important to be set aside for matters even of such interest as I do not doubt these ancient arts of Italy might be made to assume.

Turning from their yesterday to their to-day, we cannot but observe that, in almost every department in which their ancestors excelled, the modern Italians exhibit, if not a considerable power of production, at least very respectable exceptional proficiency; and if not within the walls of the Florentine Exhibition, at least in contemporary art-productions elsewhere, we may trace a partial revival of almost every ancient process known to the Italians of Medicean times.

It is probably in the purely Fine Arts that the principal degeneracy is to be recognised; in the strictly technical there exists by no means the same falling away. The reason for this may not be hard to trace, in the amount of liberty which has for many years past been enjoyed by the lower orders, as compared with that moral and mental subjection in which the middle classes have been held. Whilst every-day necessity, and the passage of interminable "*forestieri*," have created sufficient demand to stimulate the capabilities of the workmen, the apparent hopelessness of their careers has unquestionably deterred many who, from the middle classes, would have supplied proficient artists and designers, from entering upon those severe studies by which alone excellence in the higher branches of art can be attained.

To proceed with some little method, it will be well to take first of all the three generally received fine arts—Architecture, Painting, and Sculpture; and then the leading art-industries in succession, noting briefly the apparent condition of each, in Italy at the present date.

With regard to architecture it may be observed that the pernicious influence exercised by Bernini and Borromini, whose trivialities obtained excessive vogue

during the greater part of the seventeenth century, tended to the production of that *rococo* style which caused a great deterioration in the florid ornament of the Roman, Venetian, and Northern Italian schools. But extravagant as Bernini was, it would be unjust to deny that he frequently redeemed his excesses, as in the colonnade of St. Peter's and in the Church of St. Agnese, in the Piazza Navona, at Rome, by great facility of design and a certain not unobvious bravura of style. Borromini's great follower, Guarini, out-Heroded Herod, and demonstrated by an *argumentum ad absurdum*, the ridiculous consequences of adopting the whimsicalities of Borromini.

The brilliant talents of Vanvitelli, and the majestic scale upon which he worked out the immense palace at Caserta, tended to maintain the dignity of his art during the greater part of the eighteenth century; and showed that magnificence and grand conceptions of pictorial effect had not yet deserted Italian architecture. From his death, in 1773, architecture, and ornament also, greatly declined; and although monuments upon a large scale have been frequently erected, since that period in Italy, but few of them are worthy, in any quality excepting that of scale, to rank with the purer taste of earlier times.

The feeble Classicisms of the style of the Empire were generally slavishly reproduced in Italy during the early part of the present century; and until comparatively recent days little of considerable merit has been executed.

The works of Piranesi, Albertoli, Ciccognara, and Canina, and the illustration principally by foreigners—such as Percier and Fontaine, Mazois, Grandjean, Famin and Montigny, Gouthier, Letarouilly, Zahn, Gütensohn, and Thürmer, Grüner, Taylor and Creey, Willis, and Hessemer—of their great monuments of art, have led to a return to a purer class of architectural ornament than had been previously in vogue; while the earnest writings of the Count Selvatico, and the translation of Rie's "*Poésie Chrétienne*," have introduced to the Italian architects those rational principles of design, including the treatment of constructive form and of ornament, originated amongst us by the younger Pugin.

The great scale of the existing edifices, and the reparations which it has been necessary to make from time to time to save them from destruction, have constantly maintained Italian artisans in the practice of rivalling the ancient work; so that in every department of building hands at least abound perfectly capable of carrying out the most difficult designs.

No better illustration of this abundant material power could probably be given than the rapidity and dexterity with which the buildings for the Exhibition were adapted to their present purpose in a few weeks only, under the skilful direction of the architects, Signori Presenti, of Cortona, and Martelli, of Florence.

The feeble academic system which has until recently prevailed, and under which the professional chairs were not unfrequently occupied by political parasites rather than by duly qualified professors of real abilities—coupled with the lack of occupation—has certainly enfeebled the powers of the last generation of architects in Italy, although there are, of course, some honorable exceptions to such a reproach.

Among them I would place conspicuously the Cavaliere Niccolò Matas, of Florence, who is now on the eve of completing a work which must for ever do honor to his country. I allude to the restoration of the façade of the Church of Santa Croce, which is being conducted upon a scale of nobleness worthy in every respect of the building in which are deposited "*ashes*" which, as Byron says, are in themselves "*an immortality of dust*." The whole of this work, which is of enormous extent, is carried out in different-colored marbles, wrought with an exactitude worthy of the celebrated masonry of the shrine of Oragna, in the Or San Michele, so highly praised by Vasari. The sculpture is being executed by the most distinguished sculptors of Florence, and the result of their combined abilities is such as could scarcely, I believe, be rivalled at the present time by designers, artists, and workmen in any of the capitals of Europe.

Scarcely less praises should be awarded to the authors of the noble restoration now making of the Bargello at Florence, the old palace of the Podestas.*

THE LENDAL BRIDGE, YORK.

ON Friday week the Lendal-bridge Committee met Mr. Page at the Guildhall, to take into consideration the tenders for the ironwork of the new bridge to be erected across the Ouse at Lendal. The following sent in tenders, and the estimates approximated to the amounts stated:—

J. Whitelaw, Dunfermline	£6,012
J. Carrick, Pimlico	5,713
Cliffe, Bradford	5,023
Handyside and Co., Derby	4,920
Randallstiff, London	3,744
Hawks, Crawshaw, and Co., Gateshead	3,426
Calvert and Co., York	3,317
Head, Ashby, and Co., Stockton-on-Tees	3,170
The Brynbo Iron Company, Wrexham	2,953

The Committee decided to accept the tender of Messrs. Hawks, Crawshaw, and Co., of Gateshead. Including some extra work, which will require a particular description of iron to be employed in some places to strengthen the bridge, their contract of £3,426 will be increased, it is expected, to £3,611. This amount, however, will not cover the entire cost of the ironwork, inasmuch as the cross girders and the corrugated plates belonging to the foot and carriage way of the fallen bridge will have to be refixed in the new structure at a cost of £3 10s. per ton. By the tender Messrs. Hawks, Crawshaw, and Co. undertake to complete the work within six months. Workmen are now engaged in removing the fallen girders of the bridge, and their labors will be completed in a few days. Mr. Graham, the resident engineer, has arrived in York, to superintend the erection of the new structure, and operations will be commenced almost immediately.

Chesterfield National Schools.—These schools, thoroughly restored internally and rebuilt adjoining the street, comprise the old school-rooms, 47 feet long each by 27 feet wide, with new class-rooms, 20 feet by 14 feet, to each school-room, with porches, tower, and staircase, closets, &c. The whole of the buildings are of a substantial character, built of the best pressed bricks, interlined with black and white brick bandings and stone dressings. The style adopted by the architect is of early domestic character. All the timbers in the roofs and ceilings are exposed to view, being stained and varnished, and each schoolroom is fitted with desk and seats of the pattern recommended by the Committee of Council on Education. Care has been taken to render the warming and ventilating of the schools complete. The boys and girls have each a separate playground, with sheds and conveniences. The works have been executed from the designs and under the superintendence of Mr. S. Rollinson, architect, by Mr. Joseph Watts, builder, for the sum of £630, and without any extras.

* To be continued.

ON THE SANITARY CONDITION OF THE DWELLINGS OF THE OPERATIVE CLASSES IN EDINBURGH.*

FIVE-AND-THIRTY human beings, living, moving, working among us, lie down at night under the shelter of their own roof, and in the security of their own beds—their eyes closed in sleep, a sleep which, to many of them, will know no waking till that trumpet sounds when the graves shall give up their dead. The fact is awful and appalling. The tall, skeleton-looking walls still standing in grim desolation, displaying, as if in mockery, trifling articles of household gear saved from the universal destruction; the torch-light searching for the dead and dying, the covered biers, conveying the dead to their temporary resting-places, and the hundred and one concomitant attendants of such an event, all lend a dramatic interest to it, and throw gloom and horror over the neighbourhood. Such startling incidents are surely designed by Providence to arouse and warn us; and at this moment they seem, to a certain extent, to have done so, for many are now concerning themselves regarding the temporal well-being of their poorer brethren who lately bestowed not a thought upon them. I would not detract from the solemnity of that event, or say aught to lessen the impression which it has made, but I cannot help observing what a small proportion the number of those who thus miserably perished bears to those who, unnoticed and unknown, are daily and hourly sacrificed to a violation of the laws of life, as palpable and as monstrous as was the violation of those laws of mechanics which caused that building to give way. It is not enough that architecture should concern itself with the outward beauty or the inward stability of the erections which it designs; intended, as they are, to shelter man from the inclemency of the weather, they should not be constructed so as to expose him to the attacks of more dangerous foes, and as you have already been so ably addressed in this place by Mr. Cousins on the first branch of the question, I purpose to restrict myself very much to the second, and to endeavour to show how unfit the dwellings inhabited by many of our artisans are for their purpose, the fearful consequences which their faulty structures involve, and, lastly, to consider whether any fitting remedy can be applied to the existing very faulty state of matters. The first sentence of one of our most recent treatises on physiology, or the science of life, is to the following effect:—"For the maintenance of the life of man three chemical conditions must be complied with—he must be furnished with air, water, and food." The philosophical explanation of this necessity is not difficult. No part of a living mechanism can act without wearing away, and for the continuance of its functions there is, therefore, an absolute necessity for repair; in proportion, then, as these wants are supplied will be the strength and health of the individual, and, therefore, of that aggregate of individuals which we term the community. As civilisation increases, cities enlarge in these; in olden times, for the sake of the protection afforded by their walls against the rapacity and cruelty of foes, and in modern times, on account of the value of the land on which they stand, the inhabitants are more or less closely crowded together, and an artificial state not very conducive to health is induced. The nomadic savage roams at large over the boundless and airy plain, and pitches his tent by the side of some fresh and pure fountain; but though cities have their advantages, their erection certainly compels us to abandon some which were possessed in the savage state. Take the conditions of life I have mentioned in order, and first of air. When we examine the scientific history of the air we breathe, we are struck with the wondrous provisions made for establishing its due proportions and preserving its purity, proportions which cannot fail to be interfered with, and purity which must be sullied by the vapors and gases which human beings, crowded together, unavoidably generate. It has been calculated, with apparent truth, that the materials taken into the human body as food and drink are rendered back again by the adult, to the amount of a ton and a half annually, in other, and in what we might call viler, forms, after having subserved their purposes in the economy. The average amount, as determined by the experiments of Seguin, escaping by pulmonary and cutaneous exhalation alone is upwards of two pounds a day. Thus, from the decay of animal and vegetable matters, from the very presence of living animals, from the combustion necessary for the warming of our dwellings, the preparation of our food, and for the carrying on of the numerous manufactories which the necessities or the luxuries of man have created, various chemical compounds are produced, many, or should I not say most, of which, being volatile or gaseous, ascend and mingle with the atmosphere, rendering it less fit for respiration. We have no chemical test delicate enough to detect the presence of many of these, but, nevertheless, like the latent miasma from the marsh, they may do their work, and poison the system that inhales them. And along with air may be classed the cheering light, deprived of which plants and animals alike languish; for it is scarcely possible to imagine a supply of pure air without at the same time a supply of good light. To secure these, then, we must have ample means for removing those impurities which are so largely the source of contamination of the air, the supply of free and pure air by ventilation; the lessening and abating of all that is noxious in our various manufactories; and, lastly, a sufficient supply of good water. This last I have already classed under the necessities of our being. Returning to our first proposition, we find that three chemical conditions are essential for life—air, water, food—and that the whole science of sanitary economy is occupied in deciding how these are to be supplied, most speedily, most abundantly, and most cheaply. Our physicians, who have the most ample opportunities for such observations, are now demonstrating to us that, precisely to the extent to which we violate these necessities of our existence, to the same extent will the natural consequences of sickness and death follow. Thus Dr. Murchison, in his elaborate essay on the causes of continued fever, states as a legitimate induction from very extended observations, the two following propositions among many others:—"Overcrowding, with deficient ventilation, and destitution, appear to be the essential causes of typhus and relapsing fever, and to be capable of generating them *de novo*; while there is no evidence that they have any such influence over typhoid fever." "There are many circumstances which tend to the belief that the emanations from decaying organic matter, or organic impurities in drinking water, or both of these causes combined, are capable of generating typhoid fever." Again, in the Report of the Royal Commission appointed to inquire into the sanitary condition of the British Army, presented in 1858, the relation between overcrowding and tubercular disease is clearly shown, and when we bear in mind how many diseases the tubercular diathesis comprehends, and the low state of vitality and therefore incapacity of resisting or recovering from the attack of any disease which it involves, we can form some

idea of the wide-spread misery which it engenders. It is an old maxim, that when the cause is taken away, the effect ceases. If, then, so many diseases arise from and are clearly dependent on bad sanitary arrangements; and if so many others are thus aggravated, causing death from them in some cases and a protracted recovery in others, it follows necessarily that, if these defective arrangements were remedied, disease, suffering, or death, would be mitigated and controlled. In Edinburgh alone about 4,200 die annually, while of those 20-3 die of zymotic (epidemic and contagious) diseases which are to a great extent preventable, and many others of diseases which, with proper care, might be altogether banished—as the plague and jail fever have been from our cities, and the scurvy from our navies. From very extended observations, it has been ascertained that the number of persons dying annually in a tolerably healthy locality is 170 in 10,000. The population of Edinburgh, according to the last census, was 168,098, or, in round numbers, 168,000, which would allow at the death-rate of a tolerably healthy community 2,856 deaths annually. But the actual mortality, according to the registrar's return, is 4,200, leaving an excess of 1,344 deaths which might be prevented every year by raising the physical condition of our city. If this be the excess over the whole town, what must it be in the more unhealthy districts? If the preventable deaths be so largely in excess, the preventable illnesses must be still more so, and every sick man, whether rich or poor, as an unproductive consumer, is a burden more or less direct on the community. Thus we arrive at some idea of what the annual waste of our resources is on account of our low sanitary condition. At first sight it would appear that no city could possibly be better circumstanced than Edinburgh for the due carrying out of sanitary arrangements. Other large towns—as Glasgow, Liverpool, and Newcastle, commencing on the sea-shore—have gradually extended inland; but the remarkable character of the site of Edinburgh has influenced to a considerable extent its mode of growth. It is built on a series of ridges or hills, with intervening valleys, affording remarkable facilities for drainage operations, while they admit a free sweep of wind along our streets—too free in the opinion of many visitors. In the middle of the fifteenth century, only the High-street and the Canongate, with the adjacent wynds, would appear to have been built, and very little more was included in the first city wall, which was erected about 1450. After this the Cowgate, then an important suburb, was erected, and the alarm created by the battle of Flodden caused the wall to be extended so as to encircle it. For 250 years after this the extension still went on, but only in an upward direction; the closely-packed houses on the slopes on either side of the central ridge of the High-street were being perpetually augmented in height by the superaddition of stories, and, being separated only by closes or wynds, were almost impervious to light or air, while the absence of all drainage or means of removing soil from the houses increased the discomfort of the inhabitants, and gave "poor old Reekie" a somewhat unsavoury reputation. You must all remember the fearful sufferings of Mrs. Winifred Jenkins, who "reports that at ten o'clock at night the whole cargo is thrown out of a back window that looks into some street or lane, and the maid calls 'Gardy loo!' to the passengers, which signifies 'Lord have mercy upon you,' and this is done every night in every house in Haddingburgh; so you may guess! Mary Jones, what a sweet savor comes from such a number of profuming pans! But they say it is wholesome, and I truly believe it is; for, being in the vapors, and thinking of Isabella and Mrs. Clinker, I was going into a fit of asterisks, when this whiff, saving your presence, took me by the nose so powerfully that I sneezed three times and found myself wonderfully refreshed." Captain Burt, of the Engineers, who was employed in the construction of the military roads about 1715, thus describes the same scheme, and oppressed with the filth of Edina, pathetically asks, "for which of his sins he was sent into such a country." "There happened nothing extraordinary between this place and Edinburgh, where I made no long stay. When I first came into the High-street of that city I thought I had not seen anything of the kind more magnificent. The extreme height of the houses, which are for the most part built of stone and well sashed, the breadth and length of the street, and (it being dry weather) a cleanliness made by the high winds. I was extremely pleased to find everything look so unlike the descriptions of that town which have been given me by some of my countrymen. Being a stranger, I was invited to sup at a tavern." On leaving, "being in my retreat to pass through a long narrow wynde or alley to go to my new lodgings, a guide was assigned me, who went before to prevent my disgrace, crying out all the way with a loud voice 'Hud your haunde!' The throwing up of a sash, or otherwise opening a window, made me tremble; while behind and before me, at some little distance, fell the terrible shower." Then, as now, those in power were occasionally roused from their supineness by the advent of pestilence or the fall of a house; a few insufficient steps were taken, and then all lapsed into the former state of easy security. Thus, in 1721, there being an apprehension of the plague visiting Edinburgh, the Town Council consulted the College of Physicians, who returned an answer which I have had copied from their minutes, clearly showing that the principles of sanitary reform, supposed to be a modern discovery, were then well understood, and that our want of attention to the arrangements conducive to health has arisen rather from indifference than from ignorance of the consequences of neglect. The recommendations of the College may be condensed as follows:—1. The draining of the North Loch, then a pestilential swamp. 2. The doing this with all convenient speed, "that the mud and filth contained in its bottom may have time to harden and dry gradually before the sun returns to his heat and light." 3. The formation of a canal in the centre, with a constant supply of running water to carry off impurities. 4. The removal of slaughter-houses and dung-hills to some considerable distance from the town. 5. The effective cleaning of the streets, closes, and courts. 6. The erection of "houses of office" at convenient distances and in convenient places. 7. Dust carts to go round, and on the blowing of a horn servants to bring their filzle to them, and a penalty to be imposed on any one throwing filth over a window. 8. That all persons, hospitals, and public buildings be kept neat and clean. 9. That all gardeners be enjoined to bury decaying vegetable matter. 10. That all vagrants be removed.*

MEMORIAL TO THE LATE MR. BRAIDWOOD.—A tribute to the memory of the late Mr. Braidwood has been raised by the members of the M, or Southwark division of police. It is of Portland stone, and designed and executed by Mr. S. H. Gardiner, of the New Kent-road. It is intended to be placed against a wall, and supported by iron brackets in such a position as to mark the spot where Mr. Braidwood fell beneath the ruins.

* From a Paper read before the Architectural Institute of Scotland, by Dr. ALEXANDER WOOD.

* To be continued.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN Ordinary General Meeting of this body was held on Monday evening, at their Rooms, Conduit-street; Mr. M. DIGBY WYATT, V.P., in the chair, in the absence of the President, Mr. Tite, M.P., who was prevented from attending by a severe cold.

Mr. T. HAYTER LEWIS, hon. sec., having read the minutes of the last meeting, which were confirmed, drew attention to some specimens of zinc sent for inspection by Mr. James Edmeston, and which that gentleman believed to be hitherto unequalled in England.

The Great Exhibition.—The CHAIRMAN stated that the Art Designs Committee for the coming Great Exhibition, would be glad to receive contributions of designs for ceilings and mural works, which could come under the head of art manufacture, by Gibbs, Adams, Chambers, Soane, Smirke, Barry, Jones, Wren, and other deceased architects. It would be well for gentlemen who might have some of these things in their possession, to send them to the Committee as contributions for the Exhibition.

Mr. G. GODWIN was glad this subject had been mentioned by the Chairman, because he believed a great misconception existed out of doors, in reference to the obtaining of space as many were of opinion that if they had not already applied for space, they need not apply now, as being too late. Now, he knew that many would contribute pictures for the Exhibition, if they were aware they would still be received, to make up a series, or to complete any portion of the collection.

The CHAIRMAN said he was not a member of that Committee, but he believed the arrangements for the pictures were very nearly completed, though no doubt eligible specimens would still be received. But the arrangements of the Art Designs Committee were not in a complete state at present.

The Essentials of a Healthy Dwelling.—Mr. HENRY ROBERTS then read a paper entitled "On the Essentials of a Healthy Dwelling, and the Extension of its Benefits to the Laboring Population," which will be found elsewhere.

Mr. CHADWICK remarked that humanity was greatly indebted to Mr. Roberts for the persevering and energetic manner in which he had brought forward the *generalia* of his paper before different societies and institutions in different countries of Europe. But he thought that in the present state of the subject they might go beyond *generalia* and treat the subject analytically. There were grave questions to be treated analytically, such as ventilation, the best mode of warming rooms, the best construction of walls, and of windows. As to ventilation, what was the minimum size of a room for five persons, for two persons, and for one person? Then, what was the best apparatus for warming? Again, the abolition of the cesspool being agreed upon, what was the best apparatus that could be used?—as some said it required two gallons of water, and others only half a gallon. What was the best method for cottage dwellings? The cheapness of construction would be covered very much by the amount of consumption, and the amount of consumption increased when those points were settled. In the case of warming, for example, the poor man's fireplace in London had generally consumed about one hundredweight of fuel, while in Warwickshire and other districts the quantity consumed was two hundred or more. Now, the question was, which was the best fireplace to be constructed? And another question was, what was the best kind of wall? If they went abroad to crowded residences they would find that where a body had been retained any time the dead man's smell was adhering to the wall. Damp caused many evils. The common brick absorbed about a pint of moisture. At the time of the Board of Health, when in some districts fever and other diseases were in every house, the people were ordered to remove for safety, and the houses were ordered to be lime-washed. In some cases the landlords would not do it, and the consequence was, that when the population returned, the disease also returned. As to absorbent walls, the common brick absorbed something like a pint of moisture, and in a poor cottage every pint of moisture got away was a good. They got larger bricks, hard-burned, and non-absorbent. They got out some years ago some examples of walls of that kind, the 9-inch wall made with bricks of a very large size, such as 9 by 18. And they were made cheaply, at something like 4s. the superficial yard, instead of 4s. or 5s. for a common wall. He remembered the late Mr. Thomas Cubitt saying to him that if he introduced a new kind of brick the workmen would strike, because it was new. Only recently when down in Lancashire, he was told that where Platt's machine was introduced for making bricks of immense pressure, and having the quality of non-absorbency, the workmen had struck, and it was said that some were induced to do so by the brickmakers. This analytical course of examination would be most profitable in the progress of this great question, and having determined the several points involved, the next consideration would be how they were to be put together in the production of a cottage, and lead to a reduction in its price, a great desideratum in the matter. Improvements had been made, especially in bricks, and in the construction of rooms for married non-commissioned officers, in reference to which he had the honor of submitting to the late Lord Herbert some suggestions in detail. The settlement of the materials, and of the apparatus to be employed should be well considered; the analytical process was the best mode of proceeding, for by it the greatest good could be produced.

Mr. JENNINGS was heterodox upon some points the lecturer had insisted upon. As to the removal of cesspools, in building cottages in the country it was impossible for them to get rid of cesspools. If cottagers were to have the benefit of their gardens they must have cesspools, and he spoke as a proprietor of cottage property in the country. What was wanted was to get people to properly occupy the cottages; there was not the slightest difficulty in getting people to build cottages if they got tenants to occupy them properly, which there was great difficulty in getting. The letting of rooms was a most important question, but they could not stop it. He found that his tenants would let the rooms, and if he turned them out for so doing he should be considered a harsh landlord. He then proceeded to observe that the Nuisances Removal Act had not worked advantageously. He had been asked to carry out certain sanitary matters at some of his cottages, but he found it would be better to pull down the cottages than comply with the requirements. Other requirements were made by a sanitary committee, but he declined to comply with them, ejected the tenants, and shut up the cottages for two years. The great difficulty as to cottage property was that the proprietors could not get good tenants. He could not agree with Mr. Roberts that chalk was not healthy; he thought it was as good as gravel for building cottages. As to the question of ventilation; he believed it was not so difficult if they could but persuade the occupiers not to paste up the ventilators. He had carried up ventilating flues with every stack of chimneys for cottages, and had found that very successful. It was singular, but he had found that tenants sometimes selected cottages which had not so many conveniences as others which they might have had. As to walls, they could not use the hard burnt bricks practically as they would not take the mortar. As to ventilation, it was the fashion to use casements to cottage windows, but that was a mistake. It was indispensable, if they expected to get places ventilated, they should have sashes. The cottages would not have the ventilation if casements were used. Then, again, as to roofs, slate had an advantage over tile for roofs. It was found convenient to have cottages covered with slate, and felt under it. Wooden floors ought not to have floorcloths.

Mr. G. GODWIN said the subject they had met to consider was an enormous question. They knew for certain that thousands were dying every year because the arrangements of dwellings were not right, and that want of circulation and ventilation produced fever and other diseases. They knew that emanations from decaying matter would produce typhoid fever, which was desolating the homes of this country, and which had deprived us of that most valuable life—the Prince Consort. Therefore, if they knew that attention to principles which were clear was right, and that the application of these principles would produce good, they should approach the question with calmness and seriousness, and endeavor by all the means in their power to advance their knowledge on the subject. The cause of so many deaths was the non-application of the knowledge they possessed for the benefit of the population. He then suggested the propriety of appointing a committee of the Institute to investigate all the recent improvements, and to investigate the possibility of constructing proper houses. A brick might be impermeable on the outside, and so arranged as to adhere to mortar. Let them make investigations in order to have an impermeable house, and let them endeavor, if possible, to have ventilated rooms. He then referred to the bad ventilation of our bed-rooms, and thought most seriously that that matter should be taken up. They ought also to see whether they could not improve roofs. The only three clauses of the Building Act relating to sanitary matters had proved utter failures. If certain conditions were obtained, and principles laid down, they should then be able to procure a healthy house.

Mr. ROBERT KERR moved a vote of thanks to Mr. Roberts for his paper, and suggested that the discussion should be adjourned to a future meeting.

Mr. HORACE JONES seconded the motion, which was carried.

The discussion was then adjourned to that day month.

Mr. ROBERTS remarked that if his paper had been fully read, instead of a large portion of the earlier part having been omitted, much that fell from Mr. Chadwick and Mr. Jennings would have been found referred to in it.

ARCHITECTURAL ASSOCIATION.

AN Ordinary General Meeting of this body was held at the rooms, 9, Conduit-street, Regent-street, on Friday evening, Mr. T. ROGER SMITH in the chair.

Nominations for Membership.—The following gentlemen were nominated for membership and will be balloted for at the next meeting:—Mr. J. Johnson, 10, Cliff-street, New North-road (proposed by Mr. Arthur Smith, and seconded by Mr. H. A. Reeves); Mr. North, 35, Radnor-street, Chelsea (Proposed by Mr. Arthur Smith, and seconded by Mr. T. M. Rickman).

The Collectorship.—The CHAIRMAN announced that Mr. Moody had been appointed collector of the Association in the room of Mr. Gould, resigned.

The Florence Cathedral Competition.—Mr. RANDALL DRUCE drew attention to the competition for the execution of the facade of the Cathedral of Florence, which was open to the artists of Europe, but the *Nazione* of Florence did not contain any particulars, and he wished to know if any member could give him any information respecting the competition. The *Nazione* gave no information respecting the dimensions and other matters.

The CHAIRMAN thought the Italian Legation would probably furnish the desired information. In the case of the prisons at Turin and Genoa all the requisite information was to be found at that Legation.

Public Memorials.—Mr. RANDALL DRUCE then read a paper on Public Memorials, which will be found referred to in another portion of this Journal.

The CHAIRMAN said the meeting had heard Mr. Druce's very interesting paper, which was peculiarly appropriate at the present moment, when a national feeling existed for the erection of a great memorial to a very great man, and then invited observations on the paper which had been read.

Mr. T. M. RICKMAN remarked that many bodies had thought to a considerable extent upon this matter within the last few months, and he was of opinion that Mr. Druce had brought before them a great variety of matter which ought to have great influence on the public in settling what was to be done in respect of our new great memorial. He thought that a great number of the best memorials which Mr. Druce had called their attention to were those in which a greater expense than was necessary had been showered on what was useful. The gates or entrances to the bridges were often made for the purposes of defence, and the idea of arches arose from the idea of having good arches and portals to the city. We had not those at the present day, and had hardly any use for arches at the entrances of our bridges, but they might be beneficially used, at the approach to the Hungerford Suspension-bridge, and at the High Level-bridge at Newcastle. The monuments at Munich and other places were used as drawbridges at one time—that was, they were not passable unless the holders of the town thought fit to make them so. As to many other things which Mr. Druce pointed out, he thought it would be found that there had been some sort of use to which a national monument should be appropriated. If we had some such place in London, where such monuments should be placed, and where people could go to look at them as matters of interest, without looking at the building solely, such buildings would become possessed of greater interest. He could not blame people for giving churches an interest as monuments, and thought that in any memorial to the late Prince Consort something of great public utility should be given, without simply pointing out the talent of the deceased, or of the person who prepared the memorial. The greatest public utility should be combined with taste, and how that should be done it was for architects and sculptors to say. He thought, however, that architects should come forward, and not let the matter be solely taken up by sculptors. A great number of the monuments that had come down to us bore the names of the founders attached to them, because very large sums had been left by individuals themselves for certain purposes. King Edward VI. was known not so much for politics as for the schools he founded; and in Edinburgh there were a number of very important public buildings, erected at the expense of Heriot, Donaldson, and others. Heriot's Hospital was the first of them, the oldest, and by far the most interesting of the number: the others seemed simply monuments of the riches the founders left, and the conduct of those institutions was rather a source of difficulty than of advantage to the parties connected with them. In St. Bartholomew's and St. Thomas's hospitals we found some of the most valuable results of private foundations, but they did not come down with the names of the founders. He knew no instances in which it was stated who founded St. Bartholomew's hospital, or who founded St. Thomas's hospital—the institutions were not monuments, but buildings for practical purposes. The Prince Consort had shown the propriety of connecting the greatest amount of taste with the greatest amount of public utility; and he thought they waited now for some person to point out how those two could be combined in a memorial to the Prince Consort. They should endeavour to find out a way not only of pointing out the loss of the individual, but also of showing the great benefit they had derived from his life. He proposed a vote of thanks to Mr. Druce for his admirable paper.

Mr. SPIERS seconded the motion, and, in so doing, remarked that as a memorial to the late Prince Consort it would be more appropriate to have a large building, such as a new National Gallery, than simply a statue.

Mr. RIDGE thought there should be an architectural competition for a memorial to the late Prince Consort. He thought the proposed monument should be something of an unselfish character, so that it should not be said they had built a hospital or anything of that kind, but that they had erected a monument purely out of love to the Prince Consort, and not from any other motives whatever.

The CHAIRMAN thought that the two things a monument ought to bear were, the name of the deceased, and, if possible, his personal appearance. A monument in which the name of the deceased was forgotten, ceased to be a monument at all. As to the two hospitals which had been referred to by Mr. Rickman they had ceased to exist as monuments or mementos of individuals, if they were founded by private individuals. He considered the first office of a monument was to represent some individual, his name, his person, and his deeds, if there were space for it. The first duty, it seemed to him, was wherever practicable to have an effigy, then a series of bassi-relievi, illustrative of historical events in which the deceased took an interest, or of events more immediately connected with the individual. It also seemed to him that hospitals, foundations, and various other charities which had been spoken of were liable to be perverted, so far as the names of the founders were concerned, and many of the colleges of this country did not bear the names of the founders. He was sorry to differ from those who held the utilitarian view in regard to memorials. The commemoration of so great a man as the Prince Consort, in reference to a national monument, should be the great object, without the association with it of the cure of disease or the setting of broken limbs. One modern form of monuments had escaped the notice of the lecturer, that of memorial churches. It remained to be seen what would be their success, but he was afraid they would be open to the objection of hospitals and other foundations. One of the most appropriate modes of having a monument or memorial was a column for a statue, such as that at Brussels, and the *Colonne de Juillet*, at Paris. Perhaps the finest combination of architecture and sculpture attempted in this country was exemplified in the Scott monument at Edinburgh, where that monument struck him as being singularly successful. Another instance to which he wished to refer was the beautiful column which Mr. Scott had put up in Westminster, one of the most successful of modern works, and one of the few modern works of which London might well be proud. As to monumental brasses, an esteemed member of the Architectural Association, had put up a beautiful monument, which consisted of an incised marble slab instead of brass; it had been erected in a church, and the result was extremely happy, while the expense was comparatively moderate. This was a new style of monument in England, and one which many, perhaps, would prefer to monumental brass, and it was extremely beautiful in its execution.

The vote of thanks to Mr. Druce for his paper was carried by acclamation. Mr. Druce briefly replied, and the meeting separated.

CHURCH, CHAPEL, AND SCHOOL BUILDING.

Leith (N.B.).—New Episcopal Church.—The foundation stone of the new edifice for St. James's Episcopal congregation, Leith, has been laid by the Right Hon. W. E. Gladstone, Chancellor of the Exchequer. For the site the sum of £2,000 has been paid, and it is estimated that the church will cost between £5,000 and £6,000. The designs, which include a church seated for fully six hundred persons, and a parsonage, are by Mr. Gilbert Scott. The church consists of a nave of five bays, with north and south aisles extending from the east gable westward two bays, a chancel with semicircular apse, and a tower and spire. The nave and aisles are seated for the congregation; the chancel is seated with stalls for the choir; and the apse is occupied by the altar and reredos, and seats for the clergy. On the ground floor of the tower is the vestry, which has a private entrance. In the upper part of the tower is a bell-room, surmounted by an octagonal spire pierced with slender lights protected by projecting gables carried on shafts. The whole of the church is covered in with an open timber roof; that of the nave is boarded on the under side of the braces and ties to a polygonal form; and the chancel, apse, and aisles to the form of a pointed arch. There are two entrances—one in the west gable, the other in the south transept. The west door is surmounted by three two-light windows, the heads filled with plate tracery; in the apex of the gable is a vesica window. The windows of nave and aisles have three lights and in the apse and chancel are single-light pointed windows, the jambs and arches moulded. It is understood that the windows in the west gable will be filled with stained glass, by Messrs. Clayton and Bell. The extreme length of the church inside is 125 feet; the breadth of nave 37 feet 6 inches; of aisles 14 feet. The height of the tower and spire, 180 feet. The style adopted is that of the thirteenth century. Messrs. Berry, of Edinburgh, are the contractors for the mason-work, Mr. Swann, of the Edinburgh Saw-Mills, has the carpenter-work.

Edinburgh.—St. Mary's Church.—This structure has just been opened for service. The edifice was built from a design by Mr. J. T. Rothead, of Glasgow. In style it is what may be termed mixed Perpendicular of the time of Henry VII. The principal entrance, over which is a tall tower and spire, is in Albany-street. The exterior exhibits some fine work, with here and there perhaps an excess of detail, especially in the spire, which loses somewhat of its artistic character when viewed from a distance. The interior is seated for nearly 1,000 persons.

Ely Cathedral.—The Very Rev. Dr. Harvey Goodwin, Dean of Ely, has printed, for circulation among his friends, a brief account of the state of the restorations going on in his cathedral for the last three years. The painting of the ceiling of the nave, which was begun five years ago, by Mr. S. L'Estrange, is now half finished. The scaffolding has been removed, and the "Creation," the "Fall," the "Sacrifice of Noah," the "Sacrifice of Abraham," "Jacob's Ladder," and the "Marriage of Ruth," may now be seen in their finished state. The work will be resumed in the spring. To secure these valuable paintings from injury the roof has been released. Six stained glass windows and 17 carved panels for the choir stalls have been contributed by private persons. A monument in the form of an altar-tomb, of alabaster and serpentine, has been erected at the back of the reredos in memory of the Rev. Dr. Mill, who is represented in a recumbent position on the top. A complete system of lightning conductors protects the building. On the north side the dean and chapter are erecting buildings for the better accommodation of the choristers' school. The amount already subscribed for the restoration of the lantern has reached £3,670, including £1,000 from the Dean and Chapter.

Whittington, Derbyshire.—The foundation-stone of the new parish church was laid on the 1st instant. At the ceremony a leaden case containing several local papers and coins of the realm, with particulars relating to the ceremony, &c., written on parchment, was deposited under the stone, which was laid at the north-east corner of the tower. The proposed church will accommodate 600 persons, and will consist of nave, north and south aisles, chancel, organ chamber and vestry, with entrance lobby in tower at the west end of south aisle. The tower is to be surmounted with a broach spire about 100 feet in high. It will be built of stone obtained in the neighbourhood, faced with Wingerworth stone in six courses, the color of the latter being of a green tint; the dressings will be of a white stone. The style adopted is Geometrical Gothic. The works are being carried out by Mr. J. W. Thompson, bolder, Derby, from a design selected in competition by Messrs. Giles and Brookhouse, of Derby, architects.

CHAPELS.

Chapel for the North Wales Lunatic Asylum.—This chapel is just completed. Rather more than a year ago, architects were invited to send in designs; the one selected, and erected, is of the fourteenth-century Gothic, octagonal on plan, with two projections from the east and west sides; the former for chancel, the latter for porch-vestry, and the staircase, which leads to a small gallery over, for the different officers of the institution. Seats are provided for 200. The roof is supported by eight curved timber ribs springing from moulded corbels in each of the angles, and meeting in the centre, from which hangs a pendant; above, and crowning the composition, is an octagonal bell-cot, with spiral roof and iron foliated cross. The whole of the timber is wrought, stained, and varnished. The architect's estimate was £530, for which amount the building has been entirely completed. The contractors were Messrs. Lloyd and Roberts, Holywell, Flint. Sir Watkyn Williams Wynne gave £50 for a painted glass window in the chancel. The artist employed was Ballantine, of Edinburgh.

Cemetery Chapels, Bristol.—The new cemetery for the parishes of Lyncombe, Widcombe, and St. James has just been consecrated. It is situated on the Bristol-road. There is an entrance lodge at the gates; the two chapels in the centre of the ground are precisely similar externally, and are connected by a cloister, forming a distinct *porte cochere* to each entrance, between which is an arch supporting the bell-turret common to each building. The belfry is surmounted by a spire, rising to about 100 feet, crowned at its apex by a cross. Each chapel is built in the form of a cross. The unconsecrated chapel is fitted up with a tribune at the extreme end for the minister, with fittings on either side, with a robing-room in one transept, and special seats for the chief mourners in the other, both being raised off from the chapel by carved screens. The consecrated chapel, of the same plan, is divided into a chancel and nave; the east end, or apse, is paved with encaustic tiles. At the extreme end is a plain communion table, and on the north and south sides are lecterns for the officiating clergymen. The remainder of the building is arranged as the other chapel. The style of the edifice is that of the reign of Edward III. Mr. C. E. Davis is the architect, and Mr. D. Aust, the builder. The carving of the stonework has been executed by Mr. G. Porter, of Bristol.

SCHOOLS.

Liverpool.—Kirkdale Schools.—The new industrial schools and free school-room church for the district of Kirkdale, which have recently been erected, were opened last week. It is intended that the new building shall not only be used as an industrial ragged school, where children of the very lowest class of the population shall receive the usual elementary instruction, but where boys shall also be taught the rudiments of some useful occupation for their after life. This object has been strictly kept in view in the design and construction of the building; but it is also intended that on Sundays it shall be used as a free school-room church, where there will be divine service and free accommodation for a large number of the adult working population of the neighbourhood. The building stands upon an oblong piece of land fronted by Kirkdale-road. The exterior is of plain brick and stone. The basement floor is planned as a cooking kitchen, which can be used for a soup kitchen during the winter months, and has a separate entrance from Major-street. Adjoining this kitchen is a flagged space, intended as a play-room during wet weather, or for workshops when required. The main entrance to the ground floor is from Major-street, to a schoolroom 80 feet long, 25 feet 6 inches wide, and 18 feet wide, intended also to be used as a free church for the poor of the district. From this room there are a class-room, large workshop, and a store-room, covered lavatories, &c., and a large play-yard. The upper floor, which corresponds with the ground floor, and which has also a separate entrance from Major-street, is intended for a girls' schoolroom, class-room, printing shop, and large workshop. The buildings and yard walls occupy an area of about 1,300 square yards, and the entire cost has been £3,000.

Dorset.—Puddletinton New School.—The ceremony of opening this school took place on New Year's day. The old school house was a dilapidated old tenement, but now a group of buildings has been raised close to the church, consisting of a schoolroom 33 feet by 17 feet, lofty and well ventilated, and a convenient residence for the teacher, with parlor, kitchen, scullery, pantry, and three bedrooms, surrounded by about a quarter of an acre of land, affording plenty of space for a playground and garden. The designs were by Mr. J. Hicks, of Dorchester; the work has been executed by Mr. Wellspring, of the same place, the walls being built of flints with brick bands and quoins, the total cost was about £400.

The Nonconformists in Lancashire.—At a meeting of the Lancashire Nonconformists, it was announced that it had been arranged that thirty additional chapels should be erected within the county to celebrate the bi-centenary of the passing of the Act of Uniformity, on the 24th of August, 1802. It was also stated that Mr. Hadfield, the chairman, had agreed to give £3,000 towards the project. Other sums, in the course of the evening, were announced, amounting altogether to £11,150.

St. Giles, Northampton.—On New Year's day the new schools which have been erected for this parish were publicly opened. The buildings form a group, consisting of boys' school, girls' school, infant school, and three class-rooms. The boys' school and infant school are built in the form of the letter T, with one side of the boys' school and one end of the infant school facing the church. The girls' school is at the back of the boys' school, and at right angles to it, with the front facing the south. Each school has a large play-yard and out offices, having no communication with each other. The windows are all of Decorated Gothic character, and have Bath stone dressings. The tower is surmounted by a wooden bell turret. The roofs are high pitched, the timber work being stained and varnished. The principals have curved ribs, resting on stone corbels. Provision is made for ventilation by the introduction of ventilating grates in the outer walls under the floor with ventilating plates in the floors, and a series of triangular windows in the roof. On the front of the tower adjoining the infant school, over the entrance door, is a stone tablet, of the form of the "vesica piscis;" in the centre is a figure of the Saviour in alto-relievo, in the character of the Good Shepherd, supported on an ornamental corbel, with carved foliage. Around the figure are three scrolls, bearing inscriptions. Around these scrolls and the figure, and within the outside border, are cusps, formed in encaustic tile-work, executed by Minton. At one end of the boys' school, over the apparatus closet, is an organ gallery. Mr. E. F. Law is the architect, and Mr. Gosford the builder. The total cost has been £2,018, exclusive of the site and architect's commission.

Salem Chapel, Bowling, near Bradford.—A new chapel and schools have been lately erected at Bowling, near Bradford, for the New Connexion Methodists at a cost of £1,300, from designs by Mr. T. C. Hlope, architect of Bradford. The chapel is 65 feet long, including the semicircular recess for the organ and singers' gallery, behind the minister's platform, 43 feet wide, and 23 feet high from floor to ceiling, and will accommodate 400 persons on the ground floor, there being no gallery. The school behind the chapel is 46 feet long, 18 feet wide, and 14 feet high to the ceiling line. Suitable vestries and class-rooms are provided. The building is in the Italian style. The central gable of the west front projects 3 feet from the main building line, and is surmounted with a belfry. The entrance porch, 13 feet 6 inches by 6 feet, to the chapel projects from the south front, and faces an intended new street. Placed in this situation, it adds materially to the warmth and comfort of the chapel, the situation being elevated and much exposed to the west winds. The ceiling of the chapel is panelled in plaster, a panelled cone running round the chapel springs from a console cornice and joins the flat ceiling at a distance of about 9 feet from the walls. The chapel is warmed with hot air by a very simple, cheap, and effective method. The contractors are Mr. Thomas Peel, mason, Mr. Charles Neal, joiner, Mr. Schofield, plumber, Mr. John Bolton, plasterer, Mr. James Smithies, slater, Mr. Ellis, painter, and Mr. William Rhodes, smith.

W. PORDEN.—The works of this architect were the subject of some inquiry in our sixth volume. We add a note supplied by a writer in the *Athenaeum*, who says:—"When I made Mr. Porden's acquaintance, fifty years ago, he was living in intimate association with Flaxman, Phillips and Bone, Royal Academicians; with Miller, the well-known predecessor of Mr. Murray, and with the elder Mr. D'Irasci; and, if not a great architect, he was sufficiently eminent in his day to have been employed by the late Earl Grosvenor extensively, and by the Prince of Wales, for whom he built the dome, stables, and riding-house at Brighton—a pile (even in its present state) of a very superior character to the fantastic edifice into which the Pavilion itself was afterwards transformed by other hands."

THE NEW BRIDGE AT BLACKFRIARS.

NO information given at page 1000, in our last volume, we may now add, descriptive of Mr. Page's selected design, that the centre arch is 280 feet span (40 feet wider than the centre arch of Southwark-bridge), and the two side arches being each of 220 feet span, the waterway being thus 720 feet, the two piers are each 28 feet in thickness. The springing line of the arches is 2 feet above Trinity high-water mark (the tide having, on extraordinary occasions, risen 3 feet 8 inches above that datum.) The rise of the centre arch above the springing is 24 feet, and of the side arches 20 feet; hence the headway at Trinity high-water will be 26 feet under the centre arch, and 22 feet under the side arches. The arches will be in cast-iron from the piers to within 40 feet of the crown; the centre piece forming the key of the arch, 80 feet in length, being of wrought-iron; so that the thinnest part of the bridge, which is in immediate contiguity with the roadway, and consequently subject to any shocks from the traffic, would be of the more safe material. The same principle has been carried out at Westminster-bridge. All the central parts of each arch, where the wrought-iron ribs are inserted, are to be of wrought-iron. Between the main ribs, cross girders and bearers will be fixed, $\frac{3}{4}$ feet apart, on which are to be laid wrought-iron plates, and over these again a water-tight and elastic bed interposed between the plates and the roadway. The design is simple in character, but of massive proportions. The cornice is relieved by corbels, and the spandrels filled in with the arms of the City of London and those of Southwark, with some sculpture in bas-relief indicative of the Thames, the sculpture however, as before mentioned, is not to be carried out at present. The pedestals on the piers are proposed to be of polished granite; the arches at the ends of sandstone, contrasting in color with the granite. The four pedestals on each side of the bridge, 40 feet in height above high-water mark, and 23 feet in width, would supply bases for groups of sculpture commemorative of past events in our natural history. Those indicated in the drawing are intended to represent King Alfred, Boadicea leading to the charge, Sir William Walworth dealing the death-blow on Wat Tyler, and our present sovereign Queen Victoria encouraging the arts of peace. These groups, placed so as to have a sky outline, would offer to the observer a series of sculpture in a position not often equalled in this country, as they would be separate and distinct from all surrounding objects, and would stand out in bold relief. The foundation of the bridge is proposed to be formed on timber, and iron piles, similar to those of Westminster-bridge; the piers are to be of masonry. The time of construction is stated at two years and a half, and provision is to be made for the traffic without the erection of a temporary bridge, as has been the case at Westminster. Rumors of a probable delay in the commencement of the work are afloat, we hope they are unfounded.

Correspondence.

THE COLOSSEUM AND THE ENGLISH IN ROME.

SIR,—In the report of Mr. Scott's paper I notice that he says,—“One hears a story of an American who, after looking at the new works always going on at the Colosseum, remarked, with very just irony, ‘It’ll be a very fine building when finished.’” Does Mr. Scott, by quoting it, mean to make this “story” his own?

[[Of all European travellers, Americans are likely to be the least exact in their information, as they spend such a short time in any place. I remember being seated at a table d’hôte of an hotel in France next to a Member of Congress; this was in the middle of December, and I was startled to find that my neighbor had been in St. Petersburg in the first week of November, and had travelled over a great part of Europe since that period. He gave himself two or three days in Florence, and described his *modus operandi* thus:—“The first day I hire a carriage and drive through the city” so as to get an idea of the exterior of the principal buildings, and of the general aspect of the place. The second I devote to seeing the interiors, and generally get done on that day, if not, I take—but this is very seldom—a third.” What recollections can be carried away by a man who lives in such a constant whirl?

Perhaps some of your readers have been in Rome recently, and may be induced to notice the subject. I can speak confidently as to the state of the Colosseum in the winter of 1857-58. It had then no appearance of being likely to require any repair for a considerable time. There were no “new works going on.” The Pope has, I dare say, no friends, and the Papal Government is a fair mark for every one's little pellet; but I could fain wish that we had in this country such judicious conservators of antiquities as are to be found in Rome. What Canina did in his lifetime we know. True the bolstering buttress which props standing ring of the Colosseum is ugly, but it has at least the merit of showing itself the most clearly a *modern reparation*. So of the arch of Titus; a child may see which is the really old work and which is the modern. No imitative patching or piecing, but an honest unpretending stoppage of further decay. Can we say anything like this of our own country? When we begin to pull a cathedral about it is apt to come down with a run, and then we have to *restore* it.

The public works achieved during the Pontificate of Pius IX. are not to be despised. The magnificent viaduct between Albano and Laticia may challenge comparison with any in Europe. Explorations, I admit, progress slowly; but why? Because the Papal Government is poor. Let us not forget to acknowledge what priceless treasures have been taken of late years, in spite of every outward discouragement, from the catacombs, and displayed to the public at the Vatican and the Lateran.

I have no desire to be an apologist for the Pope in either his spiritual or his temporal capacity. Mainly dependent on the miserable lotto, a tax on tobacco and on an oppressive passport system, with no commerce, and little trade or manufacture, the Papal revenue must be scanty indeed. If the rulers suffer, how much more the governed? I can quite believe that the Romans groan under ecclesiastical tyranny and fiscal oppression. The same letters which recount the deplorable state of Rome report that never were the English parties so frequent and so gay as at this moment. Those most respectable looking *cocchieri* on the Piazza di Spagna are in great demand, and their demands are, doubtless, in proportion. The mosaic and cameo workers of the Croce, Condotti, and Babuino are in full employment. Count de Goyon parades his army—horse, foot, and guns—along the Corso, and out on the Flaminian Way, over the Ponte Molle, to review. The French trumpeters practice on the Via di S. Sebastiano, and drill goes on outside the Colosseum. Everything much in its normal condition.

We at home cannot understand how continental towns contrive to exist on such meagre newspapers. The *Giornale di Roma*, a sheet of four pages a little larger than those of the BUILDING NEWS, is all that the Romans have to go to for information, and this is mostly taken up with official intelligence and the movements of *Sua Santità*. The local news acquired by the English is principally derived from chit-chat with one another. They see the *Times*, *Galignani*, *Illustrated London News*, &c., at Piale's and Mondini's, and they care and know little more about the Romans than we in town. The natives keep away from the great ceremonies of the church, and appear systematically to yield possession to us and other foreigners. The only exceptions are the “happy peasants,” picturesquely attired, but encrusted with dirt and reeking with garlic. The English visit almost exclusively amongst themselves, and, as a rule, know the language very imperfectly. Alien

* An American always says “city” when we use the word “town,” and he lays the accent on the first syllable of “Italian.” By these peculiarities you can detect his country even if he has no occasion to “reckon.”

in religion and insular in manners, they are little calculated, even if they desired, to gain confidence, or get correct impressions of the people amidst whom they live. How should they? The classes with which they are chiefly brought in contact are hotel proprietors, lacqueys, coachmen, and shopkeepers—persons who are always on the look out for pawns and francs, whose civility is a very purchasable commodity, and whose rule of life is to make hay while the sun shines, i.e., when the English come.

Whenever our dear countrymen dilate on the feelings and wishes of the population, let us politely listen. Be it English gossip or American “story,” let us receive each *cum grano*.

January 21.

C. J.

SUGGESTED ROAD ACROSS HYDE-PARK.

SIR,—Mr. Harry R. Newton claims in your last Number to be the original proposer of an open sunk road across the Park, but we must beg leave to make a few remarks on the subject as the original proposers of the movement of 1861.

There can be no doubt that ever since London has extended itself to any considerable degree on both sides of Hyde-park, the subject of a road across has inevitably forced itself upon the attention of the public, or at least of various individuals. If it were worth the trouble of research, it would probably be easy to show that for twenty, thirty, or even forty years suggestions at various dates have been published. It would not be at all singular, if among many schemes several should be found to be nearly identical, although unknown to the respective originators. Whatever is unique or peculiar in Mr. Newton's plan, we should be the last to depreciate; we wish only to say that it has been suggested, as a whole, though *mutatis mutandis*, by several other persons at different times. For ourselves we claim to have originated the movement which is now in progress at this day, and which commenced by our contributing a short article to a weekly journal last summer, advocating the identical line of route set forth by Mr. Newton, though without our being aware, as the subject was then new to us, of there being any such plan in existence either by him or by Captain Powke, as per model at the Brompton Museum some years, or by any other person. We followed up the affair by articles in the local papers, *Notting-hill Times* of 31st August, *Bayswater Chronicle*, &c., and we got up a requisition to the Churchwardens of Paddington (signed by influential parishioners) for holding the public meeting which took place on 26th November last; in fact, to promote the movement took up a considerable portion of our daily time, unremunerated, during three months. To Colonel Worthly, the much respected churchwarden of Paddington, who is well known for his zeal in many philanthropic and public movements, we are greatly indebted for his countenance and energetic assistance, as well for valuable advice in the conduct of the business.

We have now only to hope that, as Government has given consent for the road, the opportunity will not be lost for want of pecuniary support, which is the only remaining impediment, but that the surrounding parishes, the Metropolitan Board of Works, &c., will join in contributing the small sum each which is requisite to make up the £20,000 or £30,000 necessary for the purpose. It is to be feared that by the unweariness of these bodies all the recent trouble and public agitation may be entirely lost.

As a last resort, it would be very desirable to have even a temporary roadway opened during the Exhibition; but it would be immeasurably preferable to secure a permanent route at once.

H. AND R. POWELL.

Bayswater, 22nd January, 1862.

TENDERS.

CHAPEL, ABINGDON.

For the new Independent Chapel, Abingdon, for Rev. S. Lepine. Mr. James S. Dodd, architect. Quantities supplied by Mr. Albert W. Dodd.	
Hallam and Co.	£2,100 0
Wall and Hook	1,942 0
Chesterman	1,929 0
Ellis	1,875 0
Todd	1,788 0
Bower	1,786 4
Thomas	1,770 0
Architect's Estimate.....	£1,800

HOUSES AND SHOPS, WOOLWICH.

For erecting and completely finishing twelve houses, four of which are shops, situated near the Dockyard Railway Station, Woolwich, for Mr. William Jackson. Mr. William Gosling, architect.

Joseph R. Lidbetter..... £3,200.

SCHOOLS, KENTISH-TOWN.

For the Gospel Oak Schools, Kentish-town. Mr. Thomas M. Rickman, architect. Quantities supplied by Mr. Cates.	
Brass.....	£3,880
Myers	3,738
Sanders	3,721
Browne and Robinson.....	3,657
Dove	3,525
Jackson and Shaw.....	£3,482
Batterbury	3,319
Sharlington and Cole	3,177
Macers	3,133

WAREHOUSES, LONDON.

For erecting and finishing seven warehouses, in Newgate-street and King Edward-street, City, for Messrs. Fandel and Phillips. Messrs. Tiltott and Chamberlain, architects. Quantities supplied.

Cubitt and Co.	£11,643
Holland and Hannen.....	10,670
Clemance	10,450
Pritchard and Shelton	10,414
Lucas Brothers	10,400
Ashby and Sons	10,288
Wills	£10,189
Hill, Keddell, and Co.....	9,989
Myers and Sons	9,965
Nicholson and Son	9,925
Laurence and Sons.....	9,920
Piper and Wheeler* (accepted)	9,920

* The two lowest tenders being the same amount, the matter was arranged by the parties interested drawing for the same.

BARRACKS, &c., WARWICK.

For militia barracks and additions to Court House at Warwick. Mr. William Kenhall, architect. Quantities supplied to Mr. Dunkley by Mr. D. J. Brewin.

Sawyer	£8,876
Brigg	8,590
Dutton	8,500
Chambers and Hilton	8,639
Green	7,697
Hart	7,425
Marriott	£7,500
Clark and Son	7,390
Clark	7,353
J. and C. W. Todd	7,144
Fox Brothers	7,140
Dunkley	7,019

COMPETITIONS OPEN.

BRIDGE.

BRISBANE RIVER.—The Municipality of Brisbane are prepared to receive designs and tenders for the construction of a bridge over the Brisbane river, at Brisbane, the capital of Queensland. The author of the best design, at the lowest cost, will receive a reward of £150, or be employed to carry the work out, providing he furnishes sufficient proof of his competency and experience in similar undertakings. A premium of £80 will be awarded to the next best design, and £40 for the next best. The plans, specifications, and estimates of the first and second designs will be retained by the Corporation as their property. The remainder will be returned to the competitors; but the corporation will incur no responsibility as to their safe delivery. Each set of drawings, and the documents accompanying them, are to be distinguished by a motto only, and accompanied by a letter in a sealed envelope, marked with the same motto, and containing the author's name and address, and such testimonials as he may think proper to furnish. Professional

judges, being non-competitors, will be appointed by the Corporation to determine the merits of the respective designs. Eligible tenders for the work, accompanying the design, will be entertained. All drawings and tenders to be delivered at Gresham House, on or before the 15th of March next. Copies of the instructions to competitors, and the plan of the city, can be obtained of F. Mangles and Co., the Colonial agents, and agents to the Municipality of Queensland, 86 to 88, Gresham House, Old Broad-street, London, E.C.

PIER.

BLACKPOOL.—Plans, specifications, and approximate cost of a pier for Blackpool, are required. The Provisional Directors offer a premium of thirty guineas for the design that shall be adopted. Printed conditions, levels, and other information may be had on application to the Provisional Secretary, E. Blane, Blackpool. Plans, &c., to Feb. 8.

CHURCHES.

BICESTER.—Plans and estimates are wanted of the work required in the restoration of Bloester Parish Church. Particulars, and amount to be expended, can be obtained of the Rev. J. W. Watts, the Vicarage; or of the Hon. Secretary, Charles Fowler, White-lands, Bicester.

CONTRACTS OPEN.

BANK.

NOTTS.—For the erection of a bank at Onndle, Northamptonshire, for the Stamford, Spalding, and Boston Banking Company. Particulars from Mr. William Eve, surveyor, 8, Union-court, Old Broad-street, E.C. Tenders on or before the 7th of Feb.

PRIORY.

HEREFORDSHIRE.—For the erection and completion of a new residence and offices, for B. Haigh Allan, Esq., at Clifford Priory, Herefordshire, within two miles of the market town of Hay. Plans, &c., with Stevens and Robinson, architects, 17, Tenant-street, Derby, to whom tenders (according to form) on or before the 1st Feb.

MANSION.

HANTS.—For making certain additions to a mansion at Horndean. Hants. Plans, &c., at Mr. Glasse's, Post-office, Horndean. Tenders to be delivered at the office of the architect, Mr. John Colsoe, St. Swithin's-street, Winchester, on or before the 1st Feb.

BATH-ROOM, &c.

TENBURY WELLS.—For the erection of a bath-room, pump-room, and cottage, at Tenbury, for the Tenbury Wells Improvement Company, Limited. Drawings, &c., at the office of Mr. Norris, solicitor, Tenbury; and further particulars of Mr. James Cranston, architect, 1, Temple-row West, Birmingham; or of Mr. Robert Robinson, Tenbury, Secretary to the Company. Tenders to be sent in to Robert Robinson, Secretary, sealed and endorsed "Tenders for Bath and Pump-room, &c.," on or before the 3rd February.

ALMSHOUSES.

LINCOLNSHIRE.—For the erection of almshouses for the Trustees of George Dawson's Charity, at Gelston, on land situate in Little Gonerby, in the parish of Grantham. Plans, &c., at the office of Mr. Edward Browning, architect, Broad-street, Stamford. Tenders, with the names of two responsible persons as sureties for the due performance of the contract, in case they should be required by the Court of Chancery, and addressed to the Trustees of Dawson's Charity, to be delivered at the Vicarage Grantham, on or before the 1st of February.

RAILWAY STATION &c.

LONDON AND NORTH WESTERN.—For a new passenger station and waiting shed at Mumps Station, Oldham; also a new cotton warehouse at the same place. Plans, &c., at the engineer's office, Lime-street Station, Liverpool. Sealed tenders to be addressed to Mr. William Long, Secretary's Office, Euston Station, London, not later than January 28.

GAOL.

MONAGHAN.—For the alterations and additions to Monaghan Gaol. Plans, &c., to the 2nd of February next, at the gaol, and at the office of the architect, Mr. John McCuddy, 24, Westland-row, Dublin. Sealed tenders to be delivered at the gaol, before 3rd of February.

DWELLING-HOUSES.

DUMFRIES (N. B.).—For the mason, joiner, and other works required to erect and complete the following buildings on the Estate of East Tinwald, for M. Carthew Yorston, Esq.:—1. A dwelling-house and steading of offices on the Farm of Fernyleuch. 2. Two cottages on the Farm of Bruntshields. 3. A dwelling-house and steading of offices on the Farm of Bruntshields. Plans, &c., with James Barbour, architect, Dumfries, to whom tenders on or before January 28th.

SOUTHAMPTON.—For the erection of two houses, &c., on the Belvedere Estate, Southampton, for Mr. John Smith, chemist. Drawings, &c., with Mr. W. Hives, architect, &c., of Portland-street. Sealed tenders (addressed to Mr. Smith) are to be delivered at Mr. Hives's offices, on or before the 8th February.

LODGE.

ESSEX.—For the rebuilding of the principal portion of Witham Lodge, in the county of Essex. Plans, &c., with Mr. Fred. Chancellor, architect, &c., Chelmsford, Essex, and 25, Old Broad-street, London. Quantities will be supplied to those builders who make application for same previous to the 31st inst. Tenders to be delivered to the architect, at Chelmsford, on or before the 7th February.

CHURCHES.

CHESHIRE.—For the works to be done in a new church at present in course of erection at Waterfoot, near Newchurch, Rossendale. Plans, &c., at the Duke of Buccleugh Inn, Waterfoot, on application to the Rev. R. Smith, Glen House, near Newchurch Station. Tenders to be delivered to James Crabtree, Esq., Newchurch, on or before 10th February, 1862.

IRELAND.—For enlarging the church of Killybegs, county Donegal, and for repairing the church of St. Peter's, City of Cork. Plans, &c., with the resident ministers. Tenders to be forwarded sealed, prepaid, and addressed thus: "Proposal for —, the Church of —, The Ecclesiastical Commissioners for Ireland, Dublin," by January 30.

CHAPELS.

YORKSHIRE.—For the various works required in the erection of two chapels, asperin tendent's house, entrances gates, and iron railing, for the Burial Board for the townships of Whitby and Ruward, in the North Riding of the County of York. Drawings, &c., with Stephenson and Son, and John Buchanan, clerks to the said Board, Whitby. Further information from the architects, Messrs. Pritchett and Son, York, or Darlington. Tenders, sealed and endorsed, will be received by the clerks on or before the 29th inst.

CEMETERY WORKS.

PETERBOROUGH.—For cast-iron palisades for the Peterborough Cemetery, 4½ feet high, with two double-gates of the width of 10 feet at the entrance, and two side gates, 4 feet wide each, with locks and bolts complete, including fixing in the stone, pillars, and coping (which will be erected by the Commissioners), and two coats of red-lead and two coats of paint, of approved color. Sealed tenders, with drawings of the palisades and gates, and the names and addresses of two sureties for the performance of the contract, to be sent to Nelson Wilkinson, clerk to the Commissioners, on or before the 2nd of February. Further particulars may be obtained of Mr. Ruddle, at his office in Newtown, Peterborough.

BRIDGE.

LANCASTER.—For taking down, enlarging, and rebuilding Agcroft Bridge, in the townships of Pendlebury and Prestwick. The new bridge will be built of stone, and will have three arches, the centre span being 45 feet, and the side arches 38 feet each. The width will be 30 feet. The bridge is about three miles north of Manchester, and 600 yards from the Agcroft Wharf of the Manchester and Bolton Canal. Plans, &c., at the Bridgemaster's Office, 41, John Dalton-street, Manchester. Sealed Tenders (of which proper forms will be sent) must be sent to W. Radford, bridgemaster, before the 30th inst., endorsed "Tender for Agcroft Bridge."

DOCKS.

WORKINGTON.—For the construction of a wet dock for the Right Hon. the Earl of Lonsdale, at Workington, Cumberland. Specifications, &c., at the offices of Messrs. Lumb and Howson, solicitors, Whitehaven; or of Mr. A. M. Rendel, C.E., 8, Great George-

street, Westminster. Sealed tenders, endorsed, "Tender for Workington Dock," Messrs. Lumb and Howson, Solicitors, Whitehaven, on or before the 28th January.

SUPPLY.

LIVERPOOL.—For the supply to the Mersey Docks and Harbor Board of good common Baltic timber, in such quantities and dimensions as are herein specified, viz.:—9,000 cubic feet, in lengths of 42 to 45 feet, and 12 to 14 inches quarter girth; 4,000 cubic feet, in lengths of 16 to 22 feet (average to be not less than 20 feet), and 12 to 14 inches quarter girth; 11,000 cubic feet, in lengths of 12 to 16 feet (average to be not less than 14 feet), and 12 to 14 inches quarter girth; or, 24,000 cubic feet in all. The whole to be free from defects of any kind, and to be delivered (free of all charges for carriage, &c.) not later than the 15th June, on the quay of the Morpeth Dock, at Birkenhead. Tenders, sealed and endorsed "Tender for Baltic Timber," addressed to the Chairman of the Committee of Works, to be sent in to the Dock Office, Liverpool, not later than 10 a.m. on the 5th February.

SEWERS.

Bristol.—For the construction of sewers, and forming roads at Earl's-meads, near New-foundland-street, for the Corporation of Bristol. Drawings, &c., at the offices of Messrs. Popes and Bindon, architects, Guildhall-chambers, Bristol. Tenders to be delivered at the Treasurer's Office, Council-house, on or before twelve noon, February 1.

MILITARY STOREHOUSE.

YORKSHIRE.—For building a storehouse at Scarborough for the United Corps of Militia Artillery, East and North Yorkshire. Plans, &c., at the Adjutant's Office, No. 19, Mulgrave-terrace, Scarborough; at the offices of Messrs. Leeman and Clark, in York; and at the office of Mr. Trevor, in Northallerton. Sealed tenders, addressed to "The Chairman of the Committee, and marked 'Tender for Militia Storehouse, &c.," to the Adjutant's Office, in Scarborough, not later than Tuesday, February 18.

BRITISH AND FRENCH RAILWAYS.—The *Engineer* has prepared from the latest returns a statement of the length and cost of railways in all the countries of the world. The following relates to British and French railways:—*Great Britain and Ireland.*—On the 31st December, 1860, the length of railways open and in use in the United Kingdom was 10,433 miles. The total amount of capital raised for their construction, and including that raised for lines then in progress, was £348,130,327. During the past year upwards of 300 miles of new line have been opened; so that the total present length of British railways cannot be far from 10,750 miles, nor their cost less than £355,000,000. The total traffic receipts for 1860 amounted to £27,766,622, and working expenses to £13,187,308, or to 47 per cent. of the receipts. 103,435,678 passengers were carried, besides 60,386,780 tons of minerals, and 29,470,931 tons of general merchandise. The train mileage for the year was 102,243,692 miles run. The working stock consisted of 5,801 locomotives, 15,076 passenger carriages, and 180,574 waggons. Of the 10,433 miles of railway open, there were 7,583 miles in England and Wales, 1,486 miles in Scotland, and 1,364 miles in Ireland. *France.*—At the end of 1860 the Minister of Agriculture, Commerce, and Public Works, reported the length of railways open as 5,778 miles, their cost having been £184,440,000, of which £32,440,000 had been contributed by the State, and £152,000,000 by companies. The gross receipts for 1860 were £16,328,540. 430 miles were set down for completion in 1861. At the end of September last the whole length of line opened was 6,147 miles, of which 4,347 miles belonged to the old, and 1,800 miles to the new *reseau*. The receipts for nine months had been £13,543,402, or at the rate of £17,797,949 per annum. The new *reseau*, now in course of execution, is to include 5,318 miles, at an estimated cost of £123,400,000, or £23,200 per mile. An expenditure of £14,000,000 was authorised last year. The lines of the Bourbonnais, 420 miles in extent, are reported to be nearly complete. The lines open in France on the 1st of January, 1858, were worked by 2,624 locomotives, and at the present time the number in use, doubtless, exceeds 3,000.

NOTICE.

Owing to an accident which occurred last week at the moment of going to press, an error appears on the title-page issued with our index. Subscribers are requested to cancel the page in favor of that given with the present Number.

The seventh volume of the BUILDING NEWS is now ready, bound in cloth, price 21s. Subscribers can have their copies bound, either with or without the advertisement pages, for 4s. 6d., on sending them to the office. Cases ready for binding the volume may be had price 2s. each.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favor us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

Q.—Thanks.

W. B. N. (Stamford).—Next week.

W. B. (Hull).—Thanks.

T. C. S.—Not of sufficient importance; thank's, nevertheless.

M. F.—Plans have appeared, view will be given. "The Chambers' Supplement" will be completed as soon as the remainder of the work can be prepared, see notice in our Number for the 10th inst.

R. A. G. (Dublin).—We really do not know of any work "best suited for an architect who perfectly understands perspective, but not having practised it has lost the opportunity of becoming acquainted with the most approved and latest method." We have not heard of any "recent improvements." We should recommend a little practice.

W. M. (Pitfield-wharf).—We believe an answer has been given.

F. L. (Northampton).—Received.

J. H.—Much obliged.

A BUILDER'S CLERK.—She'll receive attention.

H. B.—We often receive such complaints; write to the Secretary.

ANTI-STRIKE.—Yes, if not otherwise objectionable.

N.—In type.

A. S. ANTIANTH OF ISLINGTON.—In type.

A. AND W.—We shall be glad to receive tracings; proof shall be sent.

F. A.—Declined.

C.—Ditto.

M. J. B. A.—Yes.

R. E. R.—We cannot say.

THE ACQUITT.—Particulars have not been received.

MESSRS. K. AND B.—We shall return to the subject at the proper time.

CANBERRILL.—Make an application to the Board of Works, Spring-gardens.

A. Z.—Below our mark.

A LONDON SURVEYOR.—"Decisions in the Courts," are sometimes deferred for want of space.

MR. JAMISON.—Letter has been forwarded.

P. O.—It is thanked for good opinion, but we cannot name the writer. It is contrary to rule.

W. B.—Shall appear.

W. S. (Nottingham).—Next week. Is name to appear?

* * * All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Bowtell-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Bowtell-court. Advertisements received up to six o'clock on Thursdays.

HISTORIES IN STONES.

R. SCOTT'S admirable lecture at the Institute—admirable in style and matter—comes most appositely when the public mind is gradually awakening to the importance of preserving architectural monuments, on the score of their being "Books of History," enduring records of the different phases of civilisation, and faithful illustrations of the progress of the art and science of construction. Years ago the late Mr. Hudson Turner, as he stated in the preface to his "Account of Domestic Architecture in England," was led to believe "that our national records might be made available to illustrate the history of architecture in England. Strongly impressed with this opinion he began, sixteen (alas! now twenty-seven) years ago, to note down every fact bearing on the subject which offered in the course of daily reference to those records for professional objects." What Mr. Scott proposes is the converse, and he sets before us the value "of the monuments and remains by which our history and civilisation are illustrated." The history of peoples cannot be compiled from written records alone, not only because those of early periods do not exist, but because there were an infinity of illustrations

which escaped the observation of annalists, or which are thought too common-place to be noted down.

Take, for instance, the invention of chimneys. It is certainly a marking point in the history of civilisation, and an indication of progress in the comfort and well being of the community. Yet are we ignorant of the name of the inventor, and, indeed, of the century, in which his contrivance was first given to the world. It did not come into general use until the fifteenth century, although Muratori states, in his *Antiquitates Italicae medii ævi*, written in the first half of the last century, that in about the middle of the fourteenth century (1368) a Prince of Padua took chimney builders with him to Rome to build one in the hotel he put up at, because the inhabitants of the Eternal City did not use chimneys, or, according to Muratori, had forgotten their use during the intellectual eclipse which followed the irruption of the Goths. But architectural research has discovered undeniable evidence of the existence of chimneys in English structures, dating so far back as the twelfth century, although Leland speaks of the chimneys at Bolton Castle as a novelty: "One thing I much notyd in the haull of Bolton, how chimneys were conveyed by tunnells mayd in the syds of the wauls, betwixt the lights in the haull; and by this meanes and by no covers, is the smoke of the harthe in the haull wonder-strangely conveyed."

Bamburgh Castle, which, together with Coningsburgh Castle, was thought by Sir Walter Scott and Mr. King to be of Saxon architecture, exhibits a different habit of life from what existed at Bolton. It is not, however, of Saxon, but of Norman architecture, and was built in the twelfth century. The stones employed in building the Keep are unusually small, and the mortar with which they were cemented together contains small pieces of shells and charcoal, authorising the conclusion that the lime employed was obtained by calcining with wood marine shells, obtained from the seashore. The walls on one side—the front—are 11 feet thick, and on the other three sides 9 feet thick. They appear to have been built by means of scaffolding up to the first stay, to where the fillings in on the inside are mixed with whinstone, obtained from leveling the rock beneath for the foundations of the castle to stand upon. Higher up there are no fillings in of whinstone, leaving us to infer that the walls were continued without the aid of scaffolding. The roof originally rested on the second story, but was afterwards raised. No traces of flues are visible; but in what is supposed to have been the guard-room, the stones in the centre of the floor are burned red, indicating the locality of the fireplace. Near the top there was an opening, 3 feet square, for the smoke to escape. In all the other rooms the windows were mere loop-holes, 5 inches wide, except in the gables of the roof, where the windows in each were a foot wide. The outworks are built of a different material—coarse sandstone—and in all the principal rooms there are huge chimneys, particularly in the kitchen. Thus, not only does the keep of Bamburgh differ from that of Bolton, but it also differs from its outbuildings. Dr. Stukely, in his "Itinerarium Curiosum," describes all that remained entire of Glastonbury Abbey—the kitchen—as "a judicious piece of architecture." Formed from an octagon, included in a square; four fireplaces fill the four angles, having chimneys over them in the flat part of the roof; between these rises the arched octagonal pyramid, crowned with a double lantern, one within another; there are eight curved ribs within, which support the vault, and eight funnels for letting out the steam through the windows."

The remains of ancient constructions are, in some cases, all that we have to indicate positively the existence of races now extinct, or absorbed by the successive waves of population that flowed over the lands they inhabited. A few stones rudely built up are the sole indications we possess of the peoples who inhabited Greece before the Pelasgic era, and in the various remains of what is called Cyclopean architecture scattered over Asia

is the only evidence left of their being a mighty race of builders whom we call à tort et à travers Phœnicians. No one can have stood in the presence of Baalbec, and surveyed the platform of huge stones on which the ruined temples were built, without feeling convinced that we have lost the history of a people and of a civilisation replete with instruction. Nor can we but feel struck by the difference between the habits of thought and standards of excellence exhibited by the works of the builders of the Cyclopean masonry of Baalbec and of the pebble walls at Bamburgh. Who were the builders of these Cyclopean structures? Who were the men that quarried stones 70 feet long, 14 feet on each side, weighing 1,200 tons, and built them up into a platform rising 20 feet above the level of the ground? They are unknown; the century in which they existed is a mystery; even their name and race have passed from the memory of the world, and all that we can do is to presume, from the bevels of the stones, that the builders were of the Phœnician family, and that the "City of Baal" was built during the "palmy days of Phœnician history;" but almost any other presumption would be entitled to just as much credit. The buried cities of Mexico reveal the existence of a people who had passed away long before the traditions of the victims of Spanish enterprise commenced. Seeing these things, we may safely conclude that the preservation of ancient structures is of high historical importance, and is a duty incumbent upon us, not only for our own instruction, but for those who may come after us. For it is not unreasonable to suppose that as, from a few faint indications, Champollion was enabled to form into a regular language what appeared to be quaint barbaric ornaments, and Owen to construct the anatomy of a bird from its thigh-bone, so hereafter some one may arise who, from the hitherto neglected ruins of structures, will be enabled to construct the history of pre-historic peoples, and trace the influence on our civilisation of races of whom we know nothing.

To preserve what has escaped the neglect, rapacity, and restoring processes of our predecessors, and the destructive influences of our climate, Mr. Scott suggested the appointment of vigilance committees in the several districts of the kingdom, to watch over architectural ruins, to obtain means for their maintenance, and to prevent their destruction by demolition, or by no less ruthless restorations. Mr. Golwin suggested that the time had arrived when Government ought to appoint a commission for a general examination of ancient buildings, or to obtain reports as to the custody and condition of architectural remains. Although we do not go to the extent of the last named gentleman in accusing Government of having "behaved most infamously in regard to art, science, and antiquities," we admit that the time has come when the preservation of our historical structures should be seriously undertaken. We have no faith in Government initiation, because here Government is not permanent; and, in the direction measures to preserve works, change would be most disastrous. Besides, Government initiation would, by an easy process, glide into the creation of Government situations, and into the development of bureaucracy, of both of which we have more than enough already. In France the Commission for the Conservation of Historical Monuments has been the means of their destruction, and Government protection has destroyed more than did la bande noire. On almost the last occasion of M. de Tocqueville speaking in public, he called attention to the degradation and destruction of the Abbey of Mount St. Michel, which is in the custody of the Home Ministry. Consequently, we much prefer the course suggested by Mr. Scott, and believe that the Institute of British Architects could, if it chose, without waiting for Government initiation or Government commissions, effect the preservation of architectural remains and historical monuments by affiliating to itself the various architectural, archaeological, and antiquarian societies existing throughout the country. A great deal would be done if the Institute were to invite these societies to report on the present condition of architectural remains, accompanied by suggestions for their preservation, and if it were to publish these communications, in a condensed form, at the end of each session. The expense would be trifling, and the publicity thus procured would prevent the perpetration of many an act of Vandalism and neglect.

Starting from no further back than the beginning of the present century, the works of architectural, historical, and archaeological interest that have been swept away or irreparably mutilated form a melancholy catalogue. There are some utilitarians we are aware who insist that works which have nothing to distinguish them but their historical associations are not worth preserving, for they only encumber the ground. These practical gentlemen would break down Stenchege to mend the roads. But they should remember that history cannot be brought within the knowledge of many except by association with things visible, and that structures with which representative men are associated are just as much monuments to their memory as statues, or obelisks, or columns, or hospitals, or educational institutes, or museums, or reformatories. We take more interest in Shakespeare's house at Stratford than in his statue at Drury-lane, although the house has no intrinsic merits and the statue is a work of art. In the Eagle tower of Caernarvon Castle was born the first English Prince of Wales, nearly 600 years ago,—an event of note in our history. Pennant described the Castle to be, towards the conclusion of the last century, exactly the same as it was in the thirteenth century with respect to the exterior, including the statue of the founder—the First Edward—dagger in hand, over the entrance. Godstow was associated with one of the most popular of English traditions,—the fate of Fair Rosamond. In the chapel used to be exhibited her coffin and the punning inscription over her tomb.

"Hic jacet in tumba, Rosa mundi, non Rosa mundi,
Non redolet, sed olet, que redolet solet."

and the remains of curious paintings.

Pontefract Castle, which forty years ago was "a mass almost unintelligible," with "several round towers attached together, which conjecture presumes to have been the keep," was the scene of some of the most tragical events in our annals that have been immortalised by the genius of "the poet for all time." The very name calls up the bloody shadows of Thomas of Lancaster, Richard II., Salisbury, Rivers, and Grey. In the tower of Bolton Castle Mary Stuart was confined. Forty years ago or so its tenant was a farmer. The stones of Joreval Abbey were used to build fences and mend roads, and stone coffins were dug up to be turned into swine-troughs. When the present century was in its teens, a person in the neighbourhood of Masham remembered to have seen the highways strewn with fragments of inscriptions, and yet of this edifice it was written at the dissolution of the monasteries—"The lead from Joreval Abbey amounts to 399 fadders; the fairest church there (in Yorkshire) that may be seen."

Kenilworth, just before Scott's genius made it a place of pilgrimage, was a mass of bare walls falling to decay, and the habitable place was a portion of the gateway—under which Elizabeth and her paladins and statesmen passed—wherein a farm laborer's family dwelt, and cooked their food beneath an alabaster chimney-piece decorated and carved with Leicester's initials. Denney Abbey, where the foundress of Pembroke Hall was buried, was converted into a farm-house, and the refectory into a barn, though in her will she enjoined the Fellows at Cambridge "to visit the nuns of Denney, and give them ghostly counsel on just occasions." Donnington Castle, of which there remained the gate-house, with its two round towers, was the home of Chaucer, the father of English poetry. Lupus Hall, 90 feet by 45 feet, and the Chancery Court of the county, in Chester Castle, were pulled down fifty or sixty years ago to make room for the county gaol. Titchfield House, built on the site, and with the materials, of the Abbey wherein Henry VI. married Margaret d'Anjou, was the place of concealment of Charles I. after his flight from Hampton Court; but the greater part of the structure "has either fallen or been taken down." And of all these, with others too numerous to mention, which many of us have seen, what now remains to recall to mind the history of our fathers, or to indicate the progress of our race?

THE ARCHITECTURAL MUSEUM.

THE annual exhibition of works submitted for prizes to the Council of the Architectural Museum is now open in the Gallery at South Kensington. There are specimens of ironwork, stone and wood carving, colored decoration, painted glass, and tile pavements, all more or less creditable to their respective authors. We are, knowing the intelligence of our best workmen, by no means surprised at the talent displayed by them, but we were pleased to find so few examples of wasted industry. With the exception of one or two drawings for Mr. McColla's pavement competition, there are none which do not bear evidence of knowledge and study. Several in this latter series are worthy of the highest praise. They are not inferior to those which the enterprise of our manufacturers have hitherto drawn from our best designers.

The several subjects sent in for a representation in a carved stone panel, 2 feet square, of "Queen Eleanor watching over Edward I. when wounded," are, perhaps, taken together, the least successful, but we must remember that it was the most difficult task, and we can scarcely expect even "artist workmen" to possess the knowledge of professional sculptors—one only, out of the seven designs, shows the craftsman to have been equal to his work, and we shall wonder much if "Veritas," when the envelope is broken which contains his name, turns out to be a "workman" in the ordinary meaning of the term. Although the prizes are not yet awarded in this class, there can be no doubt about the result, and need, consequently, be no hesitation about anticipating the verdict of the judges. The composition of the group, the simple lines of the drapery, and the carving of the different heads, all show a well-trained skilful hand. The selection of the second best work will be a more difficult matter, on account of the merits of the other works being so evenly balanced.

The subject of a "carved and moulded stone capital," seemingly, was more suitable to the class to which the invitation was addressed. Eleven designs are exhibited, all excellent, both in execution and design, and almost equally deserving distinction.

The same remarks apply with justice also to the wood-carving, but there is here a greater diversity in style. In some cases it is polished as smoothly as glass, and wrought with the excessive delicacy which distinguishes French work; in others it is vigorously cut, yet still richer in appearance than the more elaborately defined panels, and the talent of the workman is seen, perhaps, as much in what he has forborne to do as in what he has executed. One or two competitors, disdaining the permission to use lime or other soft wood, and regardless of the extra labor it involved, have carved their designs in English oak.

The prizes for modelling in clay do not appear to have enlisted a single competitor. We wonder at this circumstance, for the subject given was by no means a difficult one, nor was it out of the ordinary line of business of many workmen in London. Neither did we see any copies of the hammered iron scroll-work of St. Paul's Cathedral, although prizes to the amount of sixteen guineas were offered for it.

The invitation to smiths for a wrought-iron door-handle has, however, attracted three competitors. The productions of two of them are good, both in design and execution, one exceedingly so. The third, representing a vine branch, is splendidly executed, but it is more a copy from nature than a design. Another specimen of hammered iron, by the same

workman, causes us to wonder why he did not compete for the copy of St. Paul's scroll-work. In that class his skill would have met with deserved reward.

The six examples of stained glass are not first-rate works, but the duller-looking one, as they are now placed, is, when carefully examined, perhaps the best.

The Ecclesiological Society's prize of five guineas for the competitor who shall most successfully color a cast of one of the Angelic choir in the north transept of Westminster Abbey, has attracted no less than twenty-two specimens of varied excellence. The judges in this class have made their award of the first prize to Mr. Wood, of Brown-street, Bryanston-square; of the second prize to Mr. Harrison, of Euston-square; and of the third to Mr. Lea, of Lutterworth. There can be no doubt of the justice of the selection. The panels have been colored in a masterly way; but, without derogating from the merit of the successful men, we cannot but think that the plain cast, stained only to represent the original stone, which is hung amongst the submitted decorations of it, is preferable to any and all of them. The one looks a noble material; all the rest appear like plaster hidden by color, on account of their natural unworthiness and unfitness to be shown without it. In no single example, by the way, is the plaster stained to the natural appearance of the stone, and then simply picked out with color, and this, we believe, is the only manner in which the appearance of the simple stone could be improved by its application. Still, as decoration, the prize designs are excellent in the style of the surface ornament, as well as in the harmonious arrangement of the color.

Several pieces of work are exhibited in competition for extra prizes offered by the Society for "actual work." As this invitation is open to all workers in stone, wood, metal, glass, and color, of almost every description, and as it needed not express preparation, we expected a larger contribution than three or four examples. A piece of punched brass-work, bearing in relief the "City arms," admirably arranged, deserves notice; and there are some good bronzed castings for a table and umbrella stand.

Mr. McColla's offer of two five-guinea prizes for tile pavements has brought no less than twenty-eight competitors into the field; we have already mentioned their general excellence, which is so great as to render the award of the premiums a matter of great difficulty. We have not space to particularise all those which really deserve mention, and as the prizes are still unawarded, we forbear, from obvious reasons, from mentioning any; but we would urge our readers to visit the Museum, and themselves recognise the ability which the Council of the Architectural Museum has evoked.

THE PROPOSED ROAD FROM KENSINGTON TO BAYSWATER.

WE understand that a decision has been come to as to this road. The Chief Commissioner of Public Works has finally decided upon the plan for a sunk road through Kensington-gardens. The road on the north will commence in the Bayswater-road, and run across Kensington-gardens west of the Serpentine, and parallel with the new broad walk, emerging on Kensington-gore, opposite the new north entrance to the Horticultural Gardens, and therefore close upon the Exhibition itself. Its length is to be just three-quarters of a mile, and it is carried across at a uniform level of 12 feet below the surface. It passes beneath the carriage drive and Rotten-row by means of two short tunnels. The total width of the roadway is to be 40 feet, of which about eight will be devoted to a footway on one side. Both sides of the cutting will be formed of sloping banks of turf, and none of the grown timber will be interfered with. The cost of the road is estimated at £35,000, the Commissioners of Public Works undertaking to pave and light it. The tolls are to be the same as at Kensington-gate—3d. for one horse, 6d. for two, and a halfpenny for each foot passenger along the pathway. The road is to be open day and night. Every holder of a £100 debenture will receive an ivory, or ticket, which will pass himself and his cab or carriage toll-free. Application will be made to Parliament upon its meeting for the necessary powers, and the Act is not to come into operation till £30,000 out of the £35,000 have been subscribed for. We believe the plan of the new road is that proposed by Mr. Page.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE adjourned special general meeting of members only, was held on Monday last, to resume the consideration of the report from the Council on professional practice and charges. After a discussion, protracted until a late hour, the report, as amended, was adopted, and ordered to be printed for circulation and publication.

PRESERVATION OF WOOD.—The preservative action of sulphate of copper on wood has long been known, but there were several anomalies in its action which required explanation. The *London Review* says that Koenig has lately investigated the chemical reactions which occur in the process. He finds that the retention of copper in the pores of the wood is occasioned by the resinous matter present; those varieties which contain the most resin retaining the most metal; whilst woody fibre, from which the resin has been extracted by alcohol, fixes no copper whatever in chemical combination. It has, furthermore, been found that the impregnated wood contains less nitrogen than that which is unimpregnated; and since nitrogenous matters are well known to be promoters of putrefaction, their removal readily accounts for the increased durability of the coppered wood. The utility of the blue vitriol as a preservative may also depend, in a great measure, upon the resinous copper salt which is formed, and by which the pores of the wood are more or less filled up, so that the attacks of insects are prevented. It is recommended that the wood be soaked in the copper solution for a longer time than is sometimes the case, otherwise the full benefit of the action is not obtained.

THE DANTE GALLERY.

THE name of the great Italian poet is so invested with interest to the literary and artistic world, that any comments on, or illustrations derived from, his highly imaginative pages deserve more than ordinary consideration. The panorama now open at St. James's Hall, Piccadilly, consisting of twenty-seven colossal paintings from the most striking portions of the "Divina Commedia," by modern Italian artists of acknowledged celebrity, will attract attention from those works being offered as fair specimens of the present state of painting in Italy, and they will also excite an interest in the minds of educated persons who may wish to become more clearly acquainted with the meaning intended to be conveyed in some of the mysterious passages of this early writer. Dante was a banished and disappointed man, and seems to have imagined that part of his poem known as the "Inferno" for the sake of devoting his political enemies to eternal torments. The whole, founded on the abstruse dogmas and formula of the Primitive church, will readily explain, besides the quaint style of writing, the difficulty of understanding many of the bitter allusions which he dared not at that period express with greater clearness.

In the present instance, however, we may say, without hesitation, that the "fine frenzy" of the poet has in no degree disturbed the calm and academic feelings of the painters. If this poem of Dante's produced a powerful effect on his contemporaries and their successors in art during the fourteenth and fifteenth centuries, and exercised a guiding influence on their works, certain it is that neither that powerful effect nor the guiding influence which prevailed during those periods has reached the professors of art in Italy by whom these illustrations have been designed and executed.

The figures generally are correctly drawn and intelligibly grouped, carefully copied from models in the studio, and transferred to the canvas with cold and conscientious exactitude. There is great difficulty, however, in treating this part of the subject. The figures depicted are real persons, and are even mentioned by name, but they are described as undergoing imaginary torments in purely imaginative regions. They are, however, the principal beings in a poem, and that poem, too, of the most mysterious kind. The question then arises how far their forms should be idealised by the painter to bring them into unison with poetic elevation of thought and yet preserve an individuality which might be defended, even if brought down to commonplace portraiture. But how would such treatment be consistent with the terrors and punishments inflicted upon individuals which are intended to apply to human nature and to every class of crime? Besides which the poet employs, to work out the intention of his poetic vision, animals and birds, some real, others imaginary, demons of various kinds, characters from the heathen mythology, angels and other heavenly messengers, all more or less employed in Hell, Purgatory, and Paradise. The artists by whom this series of pictures has been painted have solved the problem in accordance with the prevailing taste of the day, as regards imitative art, by rendering all their figures as individual as possible, for even the demons are merely ugly men with tails. As, however, this panorama has been previously exhibited in Florence with great success, we may conclude that the taste of the people has been studied, and the dogmas of papacy have been rendered in a manner permitted by the highest authority of the Roman Catholic Church.

It might be doubted, all these circumstances taken into consideration, whether the poem of the "Divina Commedia" should have been illustrated at all, but great artists, from the Renaissance downwards, have taken an entirely different view from those now exhibited of the subjects they have selected from it, and have given to them the charms of the highest treatment of which art was capable, whether in the utmost purity of sculptural form or the more varied resources of painting, either in outline, grouping, or coloring; and these efforts date from the time of Giotto and Orgagno, passing on to Raffaele and Michel Angelo, and come down to Canova, Flaxman, Ary Scheffer, and Eugene Delacroix.

If the plain matter-of-fact style of the present exhibition has proved by experience to bring the subject home with more force to the religious mind, those acquainted with the works of art by the great masters just mentioned feel how much is lost to the pictorial sentiment of cultivated intellect. Of Giotto little can be said; Orgagno is best known, perhaps, by his copy of Leonardo's "Last Supper"; Michel Angelo and Raffaele are supposed to have derived more advantage in style of conception than by direct illustration of the poet. The celebrated "Day of Judgment," by the former, is called Dantesque in treatment; but in the refined elegance of Canova and Ary Scheffer, the classic feeling in the works of Flaxman, and the breadth and tone of Eugene Delacroix, we see that even the "Inferno" is capable of poetic elevation by men of mind. With a strong recollection of "Paolo and Francesca," by Ary Scheffer, the picture of that subject in the panorama produces a painful effect; for, besides not being one of the best in the exhibition, it is so offensively commonplace that the only praise it deserves is for, in a striking degree, showing the difference between high and low art. Ary Scheffer's picture was not only pure and elegant in the forms of the unfortunate lovers, but the very tone of color was true to the poem which speaks of the "brown air" through which they are driven by racking winds, and which whirls them away for ever. A view equally poetical has been taken by Eugene Delacroix of "The Torment of Filippo Argenti," in the marshy Stygian Lake. We must give the painter of this picture in the panorama credit for not being tempted to paint the figures covered with the filth of the lake, and he has failed altogether in any attempt to convey that impression; but the

French painter did all that the poem required, and also escaped from that difficulty. He does not invest the figures with a refinement in drawing like Ary Scheffer; on the contrary, he treats them in a broad and picturesque manner, and the "marshy and miry element" is rendered very powerfully to those who know the poem, by the whole subject being enveloped in an atmosphere so dense and murky that no human being could breathe it and live. It was this subject from Dante which excited the wayward enthusiasm of Eugene Delacroix to paint his first picture for public exhibition in 1822, producing an immense sensation from the daring novelty of the style, which effected almost a revolution in art. It disgusted his master, Baron Guérin; threw the French critics in fierce contention; and won the admiration of Gros, Gérard, and Prudhon. Carlyle begins his essay on the "Hero as Poet" with the name of Dante, and, writing of the poem, he says "It has all been as if molten in the hottest furnace of his soul, and the first view he gets of the Hall of Dite is a red pinnacle, a red hot cone of iron glowing through the dim immensity of gloom." After quoting authorities so high, enough has been said to prove that the Italian painters of the present day are far below the mental standard required to illustrate the scenes in this great mystic and heroic poem.

The cold and academical style of the figures in the present panorama becomes still more prominent in the localities in which they are placed, which are conventional without being imaginative, in the higher sense of the term. In fact, the localities wherein torments so frightful are endured are as gray and unpicturesque in color as the ordinary forward drop-scene of the interior of a prison in a third-rate London theatre, and, generally speaking, subterranean gloom is rarely sustained, so that the three divisions of the poem are not sufficiently marked to assist the mind of the spectator by the necessary contrast. The whole series has been designed by Cavaliere Filippo Bigioli. Some of the superior paintings are from his pencil, but the whole panorama has been produced with the assistance of Chierice of Modena, Paliotti of Naples, Grandi, Guerra, Priora, and others. From so many names being mentioned, we might fairly conclude that the present exhibition would enable us to form a fair estimate of the state of modern historical art in Italy.

ELECTION OF DISTRICT SURVEYORS.

ON Friday last the Metropolitan Board of Works proceeded to fill up vacancies in the three district surveyorships of Bethnal-green; St. James, Westminster; and Putney and Roehampton. At the close of the first voting in each case the number of candidates was reduced to six. Subsequently, on each voting, the candidate having the smallest number of votes was struck off the list:—

DISTRICT OF BETHNAL-GREEN.

NOTES FROM PARIS.

THE Directors of the *Crédit Mobilier* have given notice that they desire to receive designs for a statue of Peace, which is to be erected in the courtyard of the hotel which will be soon terminated on the Boulevard des Capucines. The Academy of the Beaux-Arts will decide which design is best. The competitor obtaining the first prize will be charged with the execution of the statue, and the second will receive an indemnity of 3,000*fr.*, and the third one 1,500*fr.*

The Minister of Public Works has appointed a commission, composed of MM. Michel Chevalier, Alfred Leroux, Vuillefroy, De Franqueville, Avril, Busche, Talabot, Didion, Toulon, and Prosper Tournay, to inquire into and report on the construction of railways, and the cheapest mode of working them, the speed at which trains ought to travel, the terms of the contracts existing between railway companies relative to carriages in correspondence, and on all other questions relating to the working of railways which the Minister may from time to time submit to it.

A plan has been recently adopted in Paris which might with advantage be followed here, whenever a new public statue is to be erected. A model, in wood, of the statue of Prince Eugene Beauharnais has been "offered up" on the proposed site for the completed work in the Place bearing his name, and facing the *Barrière du Trône*. It is painted to imitate bronze; dressed in the costume of a general, the left hand rests upon a sword, while the right holds a scroll of the constitution of the Kingdom of Italy.

C. H. D., writing from Paris, says:—

Demolitions and constructions having been stopped by the severity of the frost, have been resumed actively since the weather has become milder. On the sides of the *Montagne Sainte-Geneviève*, the *Caserne des Carmes* and the ancient *College of Lizeux* are about to be cleared away; the greater portion of these buildings has been attacked, except the chapel, which is still untouched. It consists of a simple nave, lighted by three openings with trefoil windows in ogival tracery; the spire, covered with moss, still preserves traces of its primitive elegance. The first stone of this chapel was laid in 1370 by Charles V. It is remarkable for having been installed the 1st September, 1815, as the site of the first elementary school after the Lancaster method.

An inquiry took place at the *Mairie* of the 9th Arrondissement on the 13th inst. and following days, on the new projects of communication in Paris—viz.,

1st. Formation of a square in the prolongation of the Rue Lafayette, at the left of said street, between the Hues du Faubourg Poissonnière and du Faubourg Montmartre, and the opening of new streets leading into the square.

2nd. Construction of a new prolongation of the Rue Lafayette, between the Rue du Faubourg Montmartre and the Rue de la Chaussée d'Antin.

3rd. Prolongation of the Rue Lepeletier as far as the Rue du Faubourg Montmartre.

4th. The widening out to 20 mètres of the Rue Olivier and the prolongation of this street, on the one hand, between the Rues Saint Georges and Saint Lazare, at the extremity of the Rue de la Chaussée d'Antin; on the other hand, between the Faubourg Montmartre and the continuation of Rue Lafayette.

As regards the Rue Lafayette, according to arrangements entered into with the *Chemin de fer du Nord*, this street was authorised to be prolonged from its present termination to the Rue du Faubourg Montmartre, and it is probable that the continuation will be shortly effected.

The Hall, or "Palais," of the Tribunal of Commerce is again being rapidly pushed forward after the frosts.

Among the difficulties encountered and surmounted in the construction of the collecting sewer, the passage under the Saint-Martin Canal at La Villette has been the most important. The greatest obstacle was the influx of water, which, penetrating through a fissure in the invert of the canal, invaded the works in such quantities that the pumps for drainage purposes were totally inadequate; as the canal could not be drained off even for a day, on account of the traffic, which it was impossible to intercept, recourse was had to divers who, by repeated examination of the bottom of the canal, found out the leaking place and caulked it up. This portion of the sewer is the upper section of the subterranean artery which falls into the *collecteur général* near the Place de Laborde. A similar work is to take place in this year, in carrying on the Quay "collector" as far as the *Rapée*. This sewer now stops short at the Hotel de Ville. In order to continue it, the lock of the Arsenal on the Saint-Martin Canal must be passed under.

All the Parisian sewers are to join in the great collector of Asnières, called "collecteur-général," including those of the left or southern bank of the Seine; the sewer of the Boulevard Malesherbes receives the contents of the group. Into the latter are discharged the ancient *égout de ceinture*, which, starting from the Rue Menilmontant, formerly emptied itself into the Seine at Chaillot; that of the Rue de Rivoli, and the sewer which, receiving at the Place des Victoires all neighboring branches, is carried under the Rues Neuve des Petits Champs, Neuve des Capucines, and the Boulevard de la Madeleine.

The sewers on the south of the Seine are all united opposite the Place de la Concorde, where a junction is effected with those on the north side by means of an inverted syphon under the Seine.

The works of the new "Morgue" are being carried on again. Piles are being driven to support the concrete and foundations of the building, which will be constructed below the level of the quay, but at such a height as to be above the reach of floods.

The new Theatre du Prince Imperial, in the prolongation of the Rue du Caire, before the square of the Conservatoire des Arts et Metiers, is advancing rapidly, all the heavy work being completed. The facade may be thus described:—On the ground floor there are five large arcades, separated by pilasters; on the first story five large windows, separated by four columns; second story, four small windows. A curvilinear pediment crowns the edifice. Already the inner girders (wrought-iron) of this "salle" have been placed in position.

At the interior of Notre Dame Cathedral the works of restoration have reached the transept, and the scaffolding abutting on the northern porch has been shifted to another portion. As soon as the works in this portion of the church have been completed, it will be again consecrated to its former religious ceremonies, and the portion now occupied for public service will be delivered over to the workmen; this is expected to take place in a few months. During the year 1861, which will bear a prominent part in the history of this cathedral, important works have been executed in Notre Dame.

Since the 1st January, 1861, the spire has been completed, and the four corners supporting it have been decorated with statues of beaten lead, and galvanized; a

considerable part of the roof has been renewed; the gable end of the south porch has been rebuilt.

The restoration of the chapels opened in the northern collateral have been terminated, and they are being railed in; the principal altar has been replaced on its base, the woodwork of the choir has been restored to its position anterior to the repairs, and an organ loft has been added; the chapels around the sanctuary have been all repaired, and the defective portions of the stained glass have been restored. M. Maréchal, of Metz, has been appointed to undertake this portion of the work.

On the exterior of the cathedral the same activity reigns. The pediment over the smaller cloister door has been completely renewed; also the *Porte du Zodiaque* (left side) and the *Galerie des Rois* is undergoing a course of repair; in the latter several vacant niches have been filled up, there being only eight remaining without statues. All the nave has to undergo the scratching and scouring process, from the pavement up to the keystones of the arches. The chapels of the south collateral are to be restored; of these latter the windows are already renewed, as also the surrounding galleries and several chapels on the left of the entry. It was reported, on good authority, that all the works completing the repairs of Notre Dame were to be finished before the end of this year, but it does not seem to be possible.

The ancient boulevards formerly encircling Paris are being vastly improved; those below Montmartre have had their footpaths asphalted and bordered with granite; the two carriage ways (right and left of the centre avenue) have been macadamised in the middle and paved with blocks at the sides. The wide promenades forming the central avenue have been gravelled and planted with four ranges of young trees.

At the south of Saint Maude there is a vast plain, purchased by the authorities of Paris, in order to be annexed to the Bois de Vincennes, which will thus be joined to the fortifications on the side of the Porte de Reuilly. Important works are being now carried on in the plain; the few houses, sprinkled here and there, are in course of demolition; the wall which separated it from the Vincennes Wood has been thrown down. About a hundred kilometres of boulevards, sinuous avenues, both great and small, are projected, and no small amount of labor is daily expended in earthworks, &c.; lakes are being formed in several places, and on all sides the greatest activity prevails in the transport of earth and stone for the purpose of ornament. The principal thoroughfare will start from the Bois de Vincennes, a little above the town of Sainte Marie, towards the Porte de Reuilly. It is in a very forward state, and is to be continued in Paris by a boulevard, similar to that of Prince Eugene, so as to join into the Place de la Bastille, between the Rue de Charenton and the Vincennes railway station.

Another great thoroughfare is also in an advanced state, viz., that which is to run from the Route de Paris to Charenton, a little above the Bercy Park, as far as the *Asile Imperial* at the Bois de Vincennes. As to the "*Parquet*" de Saint Maude, it has been completely transformed and converted into an English park, with a river, lakes, green swards, &c. Before two years have elapsed the Vincennes Wood will be brought to such perfection as to rival (if possible) the Bois de Boulogne and the Pré Catelan.

The Boulevard de l'Emperor, proposed to extend from the extremity of the Cours de la Reine as far as the Bois de Boulogne, has been in construction for some time past; it has already been levelled, planted, lighted with gas, and opened for circulation, from the gates of La Muette, as far as the ancient *Barrière Sainte-Marie*, on the heights of Chaillot; on the right and left of this thoroughfare, for a length of above 500 mètres, workmen are busily engaged sinking foundations for first-rate "hotels."

The Minister of State has just decided that an Exhibition of Fine Arts is to take place at Nice next Spring. In order to give all possible importance to this display, the most celebrated artists of the day have been called upon to contribute, and a great number have signified their intention of so doing. Among the others we may name Gudin, Carot, Haneora, François, Lentun and Frère.

The *Constitutionnel* has the following remarks on the works lately carried on by the City of Paris, and on other subjects connected with the municipal operations:—"During the course of those operations the price of rent increased. A part of the Parisian population injured in their interests attributed their sufferings to the very works which had for object to preserve them. The demolition of houses was considered to be the cause of the rise in rents, and the general remark made was that the new buildings exclusively contained sumptuous apartments, and were of no use to people of moderate fortunes. Both those charges are equally incorrect. The real cause of the rise in house-rent is the increase in the population, which, in ten years, has received an addition of 427,000. The demolition of houses has been made up by the construction of a much more considerable number. It is a complete error to think that the majority of the apartments in the new houses are reserved for the richer classes. From 1852 to 1861 the number of new buildings completed in the department of the Seine amounted to 50,417. The demolitions did not exceed 10,143. During the last year, and in Paris alone, 2,932 houses, containing 17,855 apartments, have been either built or enlarged. During the same period 444 houses, containing 6,952 apartments, have been either wholly or partly demolished. The difference in favor of the new constructions is, therefore, 1,788 houses and 8,533 apartments. Are they the rich quarters which have benefited by this surplus? Certainly not. The Quartier of the Bourse has lost four houses and 202 apartments. The Quartier of the Elysée has lost 55 houses and 786 apartments. On the other hand, the Quartier Popincourt, de Reuilly, Ménilmontant, Buttes-Montmartre, Buttes-Chaumont, the Observatoire, and Vaugerard have each gained from 1,500 to 2,000 apartments. The Arrondissement of Popincourt alone, which certainly is not inhabited by the rich classes, has been enriched by 300 houses, containing 2,369 apartments. This enumeration will suffice to prove that the demolitions are not the cause of the high price of rent, and that if the municipality had not taken the initiative in these operations, the increase in the population would have had more disastrous consequences, and would have assumed the character of a real scourge."

SOUTH KENSINGTON MUSEUM.—During the week ending 25th January, 1862, the visitors have been as follows:—On Monday, Tuesday, and Saturday, free days, open from 10 a.m. to 10 p.m., 6,901. On Wednesday, Thursday, and Friday, students' days (admission to the public 6*d.*), open from 10 a.m. till 4 p.m., 1,231; total, 8,132. From the opening of the Museum, 2,454,626.

PROFESSOR SMIRKE'S LECTURES ON ARCHITECTURE AT
THE ROYAL ACADEMY.—LECTURE II.

DR. MOORE tells us, somewhere, of his having met on his continental travels with a Scotch tourist who was delighted with the mountain scenery of Italy, and was expressing his enthusiastic admiration of one of the sub-Alpine lakes, when he was rebuked by the Doctor, who assured him that there were some scenes of similar character in Scotland of not inferior beauty and sublimity, and specified one as particularly worthy of his admiration, which turned out to be part of the Scotch laird's own paternal estate. He had, in fact, been born in the midst of natural beauties, so familiar, or so lightly regarded by him, that they had escaped his recollection, or, perhaps, even his notice. A similar indifference is apt to be felt by us towards all objects that are too easily accessible. In such cases familiarity breeds contempt; whilst we are wont to show and to feel unusual zeal and animation when the object of our research is remote, or accompanied in its attainment by the stimulus of difficulty.

Thus it is that we live surrounded by stores of knowledge, of which we rarely avail ourselves; museums which we seldom visit, and libraries which we never consult. Many such neglected mines of knowledge exist in London; many a rich vein is daily trodden, as it were, under our very feet, without tempting us to extract from it the treasure it contains.

I purpose this evening to invite your attention to one of the greatest of these depositories of intellectual wealth—the Library of the British Museum.

Without attempting to bring before you even the shortest or most meagre enumeration of all the objects of interest to the architectural student which that vast repository may contain (such an enumeration would, indeed, be as much beyond my powers as it would certainly be beyond the narrow limits of a lecture)—without attempting any such task, I propose now to indicate to you a few of the more striking specimens of the literary and artistic wealth which are in so great abundance in the Library of the British Museum, at our disposal, accompanying them with such remarks as may be naturally suggested by the consideration of the objects themselves, as I enumerate them. I do not design here to touch upon the antiquities at the British Museum; a critical examination of these, or even a correct appreciation of them, would be beside my purposes as well as beyond my powers. To enter that department would assuredly lead us into antiquarian disquisitions, which I am anxious to avoid, as being foreign to my duties within these walls.

The first book I shall advert to is a very large folio volume, descriptive of the great Flavian amphitheatre in Rome, and appears to have been the result of long and careful examinations made chiefly during the excavations by the French whilst in military occupation of Rome in 1811, 1812, and 1813. The author was a French architect, Mons. Paris, who had long been a resident in that city, having quitted his native country at the outbreak of the great Revolution. He seems to have been a painstaking and intelligent observer, and the delicately executed drawings of which this volume consists, with the very minute notes explanatory of them, bear testimony to his great carefulness as an architectural draughtsman. He appears to have quitted the practice of his profession as an architect early, and to have been engaged for some years in the decorations of the Royal theatres and of the Opera, at Paris. During his subsequent exile in Italy those studies were made, one of the fruits of which was the magnificent volume I have alluded to.

Probably there never was executed so complete a monogram of any one building. The only subject of regret is that the drawings generally do not distinguish so clearly as one would wish between those parts which are the representations of the actually surviving portions of the building, and those parts which are the conjectural restorations of the ingenious antiquary himself. Some of the drawings, however, are not open to this criticism, but are beautifully executed delineations of the edifice in its revived state; and I can safely affirm that all the drawings bear very strong marks of having been the work of a painstaking and scrupulous artist. The work was intended and fully prepared for publication; it has remained, however, in MS., and ultimately became by purchase the property of the Trustees of the British Museum in 1847.

In many respects the Colosseum at Rome is one of the remarkable buildings of antiquity. It has all the attributes of grandeur. In its actual dimensions, I believe it to be the largest single building ever erected, unless we except the Pyramids of Egypt, which are, perhaps, hardly to be classed as works of regular architecture. Its simplicity of character and unity of design are also sources of grandeur. There is a breadth of manner and a noble abstinence from trivial ornamentation in its external architecture, which greatly elevate the character of the building. There is a majesty, even, in its stupendous strength. It stands a monument of consummate constructive talent; a talent not parading itself, like a medieval cathedral, by the perpetual manifestation of great efforts—lateral thrusts, and counterbalancing weights; huge picturesque masses of masonry piled up solely to resist the tendency to self-destruction constantly operating on the structure. This immense building, on the contrary, stands, and has stood for eighteen centuries, not by any straining exertion, but simply because all the laws of static science have been scrupulously regarded. I am justified in saying that it has stood for eighteen centuries, because, notwithstanding the concessions of earthquakes and tempests, and the erosive agency of natural causes, it still stands with few marks of substantial injury, except those which it has received from the destructive hands of man.

It has been for ages the quarry whence ready worked stones have been continually abstracted, and whole palaces have been the results of such spoliation. Yet it survives, next after the Pyramids, the greatest architectural monument in the world.

"A ruin, yet what a ruin! from its mass
Walls, Palaces, half cities, have been reared;
Yet oft the enormous skeleton ye pass,
And marvel where the spoil could have appeared."

I must not dwell much on the structural merits of the building, but I cannot refrain from expressing my persuasion that the very ablest practical mason of the present day might study with great profit the jointing, bonding and bedding of this mass of masonry; while the brickwork is equally admirable: the dexterous economy of labor by which rubble-work, consisting of broken fragments of stone embedded in Pozzolana cement, is strengthened by an artful introduction of bonding courses of brick, these bricks being often of very considerable size, and always of excessive hardness. All this union of economy of labor with the utmost strength is, indeed, well calculated to excite the admiration of every practical eye. Yet this wise economy of labor and materials, which is apparent throughout, was never allowed to interfere with that stability of workmanship

which was evidently a paramount consideration with the builders. The three-quarter columns, for example, of which there are on the exterior so great a multitude, are not built as insulated blocks of stone applied to the surface of the wall for the mere sake of ornament, but are built in and bonded with the general masonry of the walls, contributing, therefore, to their strength quite as much as to their embellishment; in fact, the very reverse of what was very commonly the case with the slender shafts of mediæval architecture, which were often inserted to give lightness and richness of effect to the pier against which they stand, serving, it is true, to convey to the mind's eye the idea of support to the corresponding members of the archivolts, and continue down their lines, but not practically forming any real integral part of the pier or jamb against which they stand. That this was, at all events, often the case is obvious from the fact there are few mediæval buildings that have not been more or less deprived, either by natural decay or by violence, of their slender nook-shafts; the arch moulding which was made apparently to rest on them, remaining, nevertheless, perfectly unaffected by the removal of them.

It must be remembered that in their working the column as an integral part of the wall behind it, as is, I believe, invariably done at the Colosseum, a considerable amount of extra labor and some loss of material was incurred by thus sinking the circular shaft out of the solid block—a labor and waste, however, which appear never to have been heeded when the perfect stability of the work was in question. These columns, thus constructed, act strictly and effectively as buttresses, giving great lateral support, whilst they so largely contribute to the ornamentation of the structure.

In like manner we see the vast blocks of stone forming the entablatures tailed into and bonding with the rest of the masonry,—not merely laid upon the pillars to convey the idea of construction, but really forming an essential part of the wall masonry.

It is indeed very manifest that extreme durability was ever a foremost consideration in the mind of those able Roman masons. A curious instance of this feeling occurs in the construction of the steps of the numerous public staircases. Being open, and therefore constantly exposed to the weather, it is obvious that had the steps been simply laid on each other in the usual way now-a-days, the wet would have been liable to penetrate or be driven through the joints, and so, in the course of years, the gradual but constant penetration of wet would have injuriously affected the vaults and arches beneath on which these steps were laid. To prevent this a very ingenious and, I should imagine, a very effectual contrivance was devised, consisting of a sinking cut into the face of the tread where the riser of the step heels upon the tread of the step beneath it, which sinking, as M. Paris very satisfactorily shows, was made to receive a covering, or what workmen call a listing, of mastic or cement of some kind, well calculated effectually to exclude wet.

I must, however, no longer dwell on these practical subjects, which might be multiplied to almost any extent, all tending to prove that there were master-minds among the builders of Rome as well as among its military and political chiefs. Although this wonderful building now presents to our view little more than a vast mass of bare masonry and brickwork, deformed by time and by barbaric depredations, it is not to be doubted that its internal embellishment was as gorgeous as might be expected from Roman builders who were so addicted to magnificence, and who might be supposed to be especially lavish in the adornment of this, the most highly favored centre of attraction to the pleasure-loving citizens of Rome. M. Paris furnishes us with careful drawings of fragments of ornamental details which fully confirm this supposition; minutely enriched stucco linings appear to have decorated the interior of the halls and corridors, and notwithstanding the ravages that these ruins have for ages been subjected to in the search for precious marbles, fragments of fluted columns yet survive of richly colored marbles, carved most elaborately. The extent to which this elaboration was carried may be in some measure inferred from the immense amount of labor bestowed upon so subordinate a detail as the fluting of the shafts of the marble pillars.

It should, however, be observed, in justice to the architects of the Colosseum, that the somewhat excessive extent of minute decoration, as indicated by the few surviving specimens, is confined to the interior; whereas the exterior, both in the constructive features and in the details, is remarkable for general simplicity.

In this building, as in most of the Roman monuments of the best period, a greatness of manner eminently distinguishes its exterior architecture, a circumstance well worthy of your note in the proneness to crowded ornamentation at the present day so prevalent. Without going back to remoter and simpler times, we shall, indeed, find that in Roman art in its best and purest days, and in Mediæval art at the justly applauded epoch of the thirteenth century, and in Renaissance art at its period of freshness and beauty, when Bramante and Raffaele designed,—at all these epochs of art we shall find no vulgar, overloaded decoration, but abundant evidence of that just appreciation of the value of ornament which knows how to use it with due effect, and when it may be usefully dispensed with.

I will not dismiss this remarkable volume from your notice without noting the extraordinary dimensions of the building which it illustrates. I find the length of the major axis to be 580 feet, and of its minor axis 480 feet; whilst the height from the ground-line outside the building to the summit of the exterior wall is 160 feet. M. Paris makes an elaborate calculation of the actual number of sittings afforded by its marble benches: the result is 44,090 persons. The stories, therefore, of those (like Fontana and others) who represent the number of persons accommodated to have been 80,000, or even more, were either wild exaggerations, or it may be that this high number might have been obtained by counting the multitudes who could have been crowded into the numerous corridors, on the broad platform at the highest part of the amphitheatre, and possibly, too, on the arena itself.

I will now invite your attention to two splendid folio volumes of drawings preserved in the Royal Library, of which they form a part. The drawings are executed very carefully and cleverly in outline, slightly shadowed and tinted, upon vellum. The series comprises plans and views of the chief Royal Palaces of France, together with some original designs, by Jacques Androuet du Cerceau, one of the most eminent among the originators of the Renaissance in France, born about 1515.

These valuable and interesting drawings were made for Catherine de Medicis, and certainly formed part of the Royal Collection of France. How they subsequently became transferred to their present place on the shelves of our great public library is not recorded.

It is not my intention to particularise all the buildings represented in these

volumes; indeed, so rich was the French crown in Châteaux and Maisons de Plaisance in the sixteenth and seventeenth centuries, that it would extend my notice far beyond its proper limits were I to do so. All the earlier examples are characteristic of the transitional period when they were erected. In plan they retain much of the type of a medieval fortification; and this may have been probably occasioned in some cases by the erection of the palaces on the foundations of some more ancient castles of a strictly military character. But there are few that retain any provisions whatever for active defence; the bastions become clusters of embowed windows, enriched with many architectural embellishments, and the intervening curtains are occupied entirely by wide windows, lofty chimneys, and other features of domestic architecture, to the exclusion of the loop-holes and frowning machicolations of the preceding ages. Those highly picturesque buildings, the Château de Chambourg and that of St. Germain au Lage, for example, are buildings of this mixed character. They are described as Bâtimens de Plaisance, and present throughout the evidence of their having been built for agreeable residences; whilst, on the contrary, the plan alone of these buildings would convey the idea of a strictly fortified place, with moat and drawbridge, and like appendages.

The Châteaux of Blois and of Amboise are interesting examples of this picturesque, transitional style, one of the prominent features of which is the very steep and conical roof, enriched by most elaborate cresting and finials, the latter rising often to a considerable height, sometimes of metal, and sometimes executed in glazed and colored terra cotta.

The variety imparted by these means to the sky-lines of the roofs is one of the chief sources of the picturesque in the buildings of this date in the North of Europe. It is worthy of note that at the Château Amboise, the chapel, which is conspicuous in the group of domestic buildings which compose the château, is strictly Gothic in general outline as well as in its details, having lofty and slender pinnacles and buttresses, and traceried windows, whilst, as I have stated, every other part of the palace is in that particular phase of the Renaissance which prevailed in France after the general discontinuance of the Gothic manner. This distinction would seem to indicate that a sense was felt of the propriety of adopting for ecclesiastical buildings a character of architecture differing from that employed in designing domestic buildings.

I have on a former occasion expressed my opinion that such a distinction seems not unfounded in reason and good sense. To adopt a strictly medieval style of design in all its purity and completeness in the erection of a domestic building—a private residence, for example, where all the luxurious requirements and refinements of modern social life are necessarily to be expected—is a task full of embarrassment and difficulty to the architect, necessitating frequent departure from ancient types; whilst, on the other hand, the medieval style lends itself with great facility to the construction of a church or chapel in its familiar form, and with its necessary adjuncts.

There seems indeed a moral, as well as æsthetic, propriety in thus setting apart a special style to buildings of a sacred character, visibly distinguishing it from a building erected for domestic and, as it were, vulgar uses,—a distinction analogous to that which led the Egyptians to preserve an hieratic character in their sacred writing, as well as in their sacred architecture, long after classic forms and demotic alphabets had become familiar to them. I may add, with reference to this example at Amboise, that there are no indications whatever to justify a supposition that this Gothic chapel is not coeval with the surrounding buildings of the château, which are, as I have said, of a perfectly renaissance aspect.

The Château Valéri, which is in the same early French style, is particularly notable for the boldness and vigor with which it is designed—a manner so broad and forcible as to well merit the character of grandeur.

The Château de Montargis is an example of great interest, having less of the Renaissance element in its style of architecture. The sectional views convey an excellent idea of the interior of the château as it appeared at the time of Catherine de Medicis. The capacious chimney-breast in the great hall is especially observable, as characteristic of the style of the period. On the front of this chimney-breast is represented, in sculptural relief, the romantic story, which tradition has handed down, of the faithful "Dog of Montargis," who avenged the death of his master; to quote the somewhat quaint old French phraseology in which the volume adverts to the legend, it describes the subject of the sculpture as "L'histoire digne de memoire d'un combat d'un gentilhomme contre un chien, lequel gentilhomme, étant vaincre par le chien, confessé avoir tué son compagnon, maître du celluy chien."

This practice of sculpturing or painting some family legend, or other interesting historical incident, over the huge chimney-piece, round which the members and retainers of a family were habitually assembled, seems agreeably characteristic of the habits of the time, and presents a contrast very unfavorable to the manners, and even to the taste, of the present day, when we compare these simple and, perhaps, somewhat rude, yet vigorously expressed illustrations of our social state, with the paltry ornamentation of a modern parlor, the shabby, unmeaning looking-glass and putty frame which usually usurp this place of honor in the best living room of our modern dwelling-houses. The chimney-pieces or fireplaces themselves suggest similar observations. In the case before us of the great hall of the Château Montargis, the chimney-piece, as represented in this book, is typical of that feature in all the great halls of the fifteenth, sixteenth and seventeenth centuries throughout Europe. A great canopy or hood advances forward, overhauling a hearth capacious enough for the combustion of fuel sufficient to warm the whole household collectively. This overhanging chimney-breast is not usually carried by the projecting piers of solid masonry or brickwork, which, now-a-days, generally limit greatly the radiation of heat, and send it up the chimney rather than into the room. The breast, on the contrary, is usually carried by pillars or other carved supports attached to the wall, and ornamenting as well as supporting the hood which is to carry off the smoke; at the same time projecting so moderately, and occupying comparatively so small a space, as to cause very little obstruction to the radiation of warmth.

No doubt these rude contrivances may not be always very effectual in carrying off the smoke, but it may well be questioned whether a little smoke was not more than compensated for by the genial embrace which these old fireplaces offered to the whole social circle. Besides, let us candidly admit, with all the unsocial contractions which modern science has engendered, are we not still occasionally a little troubled by smoke?—smoke, without any compensating beauty, and for which we get nothing in return but damaged furniture and, perchance, a ruffled temper.*

* To be continued.

MR. DIGBY WYATT ON THE ARTS IN ITALY.*

VERY recently a programme has been put forth, inviting designs from Italian and other artists, for completing the façade of the Cathedral at Florence. The greatest praise is due to the Italians for their earnest desire to remedy so great a blot as the incomplete state of this façade has always been to that noble building, Santa Maria del Fiore, the master-piece of Arnolfo di Lapo and Brunelleschi.

In the Exhibition, under the head of "Building Materials and Contrivances," but little was worthy of remark, with the exception of the terra cotta, which was, generally speaking, very good, more especially in the article of stoves, and vases for garden decoration. There are some successful imitations of the works of Luca della Robbia, as well as of the glazed and colored tiles attributed to Girolamo della Robbia. To these we shall, however, return under the head of "Ceramics." There are some interesting collections of marbles and building stones, and some very excellent scagliola. No less than four exhibitors received prizes for the production of hydraulic cements—an article, until recently, despite their Pozzolana, scarcely manufactured in Italy. An imitation of marble, made with cements of this description, and admirably colored, has been perfected by the Marchese Campana, of Naples, and several specimens of his skill have been purchased for the South Kensington Museum. A manufactory of parquetry, on the Swiss system, has been lately established at Florence, and very fair specimens of flooring are exhibited.

Of decorative painting as applied to architecture, I observed no specimens in the Exhibition, but in the streets and houses quite enough to assure me that very great dexterity was common among men little raised above the class of ordinary house painters.

For more elaborate decorations, we know, from the skill of Signor Abbate, the decorator of the Pompeian House in the Crystal Palace, in this country, how readily competent decorators may be found; and it would, I think, require very acute observation on the part of any one inspecting the old arabesques by Pierino del Vago, in the Villa Doria, at Genoa, and the grotesques executed in the same building, by Annibale Angiolino, of Perugia, now living, to distinguish between the old and modern work.

Of the architectural designs in the Exhibition I am sorry to be unable to speak in laudatory terms. The most industrious amongst the artists appear to be Niccolò Bregaglia and Pasilio Rosati, of Naples, who produce many drawings of architectural fragments and restorations from Pompeii, executed in the French Academic style. In the remainder there is but little merit, although in water color drawings there is evidence of considerable command over the delineation of architectural form.

To say that the spirit of Canova is yet dead in Italy would be incorrect; but one is happy to recognise that, while much of his effeminacy and artificial composition is disappearing, much of his beauty of form and delicate finish in marble working is satisfactorily preserved. The care he bestowed in modelling the articulations of limbs, and the extremities generally, is rivalled in most of the best works now exhibited, although some few, otherwise excellent, fail in those important details.

The work which has attracted most attention, and with good reason, is the well-imagined and gracefully carried-out figure of "A Girl Reading," by Pietro Magni, of Milan. That sculptor, with Strazza (the author of the "Ishmael," in the Exhibition of 1851), and Vela, of Milan, an artist of great talent, may be looked upon as leading representatives of the Romantic school of sculpture in Italy, as opposed to the more Academic style, which finds its ablest representatives in Cambi, Santarelli, Costoli, and Fantacchiotti.

Dupre, of Florence, a sculptor of very great power, partakes of the merits of both classes, but falls slightly, in some of his works, into that leading defect of inattention to pure beauty of form with which the Romantists, in aiming at expression rather than the "beau idéal," may be occasionally reproached.

The most absolutely Canovesque of sculptors is, apparently, De Fabris (lately deceased), whose "Love and Psyche" is one of the honeyed but feeble reminiscences of the subject so dearly loved by his master, the father of modern Italian sculpture.

It is to be regretted that Tenerani, of Rome, Canova's favorite Italian pupil, has not contributed to this Exhibition, since his great powers would have gone far to vindicate the school of that really fine artist, under whose influence Tenerani's best works have been produced.

The principles upon which I believe the popularity of Magni's statue of the "Girl Reading" is founded, appear to me so important, and, indeed, so novel in their application to modern sculpture, that I think it my duty to dwell for a few minutes upon them. A maiden, of no great pretensions to beauty, either of form or feature, and in the simplest dress, is represented, seated on a common rustic chair, reading. There is no very great study evidenced in the arrangement of the lines either of the figure or of the draperies, and, indeed, in one important particular, the modelling of a portion of the bosom, a manifest defect is to be observed. The head is very truthfully modelled, and the expression is one of quiet concentration on the theme of the volume, in the study of which the reader's whole attention seems to be absorbed; that theme being, as may naturally be imagined, at the present juncture, the development of Italian liberty under the sovereignty of Victor Emmanuel. Such elements may not in description, perhaps, appear likely to result in the production of a striking work of art; and yet the power of this small statue is such as to arrest and enchain the attention of every one coming within sight of it.

The potency of the spell I believe to mainly consist in the concentration of purpose manifested in the whole composition. There is no straining for effect—to borrow a theatrical phrase, "no playing to the footlights"—and none of that coquetry, half-conscious of nudity, and evident flirting of the damsel with the spectator, which disfigure so many ordinary representations of female form. Other charms are unquestionably the ease, nature, and simplicity of the whole arrangement. Nothing is allowed to interfere with the tranquillity of the action, and such is the effect of this appearance of quiet that almost instinctively the spectator treads, as he passes, with lighter foot, and speaks in "bated breath," lest he may startle the marble maiden who sits wrapt in her brooding fancies, as it were, unconsciously before him. A second of Magni's works, "An Indian Mother," seated in a shawl swung over the branches of some trees, in such a manner as to make the figure appear entirely unsupported, is a *tour de force* in marble working, the slight tendency to extravagance in which is to be overlooked in the elegance of the action and the careful modelling of every portion.

A third work, by the same sculptor, is of considerably less merit. It repre-

* Continued from page 58.

sents a statue of Socrates; and, whether intentionally or not on the part of the artist, conveys an almost instinctive reminiscence of what one cannot but fancy the sovereign of United Italy himself might be with little else upon him than a rather scanty shirt. The compliment, if it be meant for one, is indeed somewhat dubious.

Vela, another Milanese, contributes one figure only, and that of an almost too voluptuous east of beauty and attitude—"Spring," a nymph bounding upwards, but, as it were, caught, and entangled in the vernal flowers from which she seems to be rising. In delicacy of modelling, and that truthful rendering of flesh in marble, which the Italians term *moribondezza*, there is nothing, I think, in the whole Exhibition to equal it. It is to be regretted that other works of Vela's are not to be found at Florence.

The most ambitious figure is certainly the "Daughter of Zion in her desolation," by Morelli, of Leghorn; but in aiming at grandeur the sculptor has neglected beauty, and thus fails to engage the sympathies of the spectator.

Fantachiotti, of Florence, who enjoys a great and deserved local reputation, exhibits several works of very considerable merit, the best being the monument to the late wife of Mr. Spence, an English artist, long resident at Florence. The figure, which is that of a very beautiful matron, is represented as extended, after the manner of some of the finest of the cinque-cento monuments, on a bier, recalling, in many particulars, the general form of the ancient sarcophagus. In front are amorini, and beneath square tablets, inserted, as it were, in a plain and well-designed pedestal. The special merit of this work is two-fold. In the first place, all that may be called pure sculpture,—that is the representation of the human form, and the draperies and ornaments connected with it—is thoroughly good; and in the second, these elements are combined with such conventional lines, masses, and ornaments, as adapt the whole composition for alliance with whatever may happen to be the architectural forms of the structure in which this beautiful work may be destined to be placed. What the consequences of the common want of skill in similar combinations may be, it is scarcely necessary to point out to an audience whose remembrances of St. Paul's and Westminster Abbey would, probably, be too poignant for me to do more now than hint at them.

Strazza, whose "Ismael" in the Exhibition of 1851, and whose "Audace" in the Crystal Palace, have made us well acquainted with his capabilities, fails to sustain them at Florence in his statue of the "Sposa Novella," which has, however, received the compliment of purchase by the King. Neither strikingly beautiful nor very expressive of its title, the modesty of the recent bride seems rather of that affected class, the freedom from which I have already commended in Magni's masterpiece.

Santaroli, of Florence, a well-known artist, exhibits a "Shepherd Boy," which has merit, but his "Magdalen" is too close a reminiscence of that of Canova, and fails to sit up comfortably. The infant's "Prayer of Innocence" is offered up rather by a little man than by a true bambino.

The same reproach as to want of truthfulness in form may be applied to the "Amore Mendicante" of Cambi, the general intention and action of which, however, is clever and expressive. The same sculptor's "Eve" recalls far too much and too many of the leading defects of our English Academician Bailey.

Pierrotti, of Milan, exposes a very good anatomical study, in the shape of "A Hunter killed by a Snake." The subject is a difficult one, and has been well mastered by the skill and knowledge of the artist.

In the true academic style, Costoli's "Death of Menecæus" is to be highly commended, as being thoroughly well modelled, and well balanced in a difficult pose. His "Charity," a large bas-relief, is by no means so good.

Dupré shows a "Mater Dolorosa," the character of which is sublime and devotional in a high degree. He has also a "Sappho," in an attitude not altogether dissimilar to, although in no way plagiarised from, that of the well-known work of Pradier; and a sculptured pedestal for, apparently, a large flower basin. The modelling and composition of the figures in alto-relievo which decorate the latter, it is no small praise to say, are, I consider, fully equal to those we so much admired in Professor Drake's pedestal in the Great Exhibition of 1851—a somewhat similar work. The attitude and expression of the "Sappho" and the draperies are admirable; but some portions of the nude have been modelled from rather too low a type of female beauty to be altogether satisfactory in a work of ideal art.

Admitted into the fellowship, if not the nationality, of Italian sculptors, are the well-known American and English artists, Power and Fuller. The "Greek Slave," and "Youth holding a Shell," the "Proserpine" and admirable busts of the former, are too well known in this country to need dwelling upon; but with his "America" we are not so well acquainted. Unlike the life and vivacity of that population, whose every breath it appears must be drawn in an atmosphere of sensation, and whose vital energies seem inexhaustible, the embodiment of the sublimated essence of modern republics is tame and dead; but, like at least the major section of that unhappy continent, she stands but feebly and tottering, and one touch only seems wanting to overthrow the unstable goddess.

By the latter artist (Captain Fuller), there is a remarkably good figure of a "Drowning Boy," admirably modelled, and full of energetic action. The tempest-tossed sailor lad still struggles, though evidently unavailing, with the elements which overpower him.

This scanty list by no means exhausts the excellences, or perhaps rightly points to the salient defects, of the really fine collection of works of sculpture, which it is not too much to say formed the leading feature of the Florentine Exhibition; but I feel that it is necessary to quit the field of pure sculpture for that application of the art which lends its highest graces to industrial production.

The two most distinguished workers in this department of industry, worthy maintainers of the fame Brustolone acquired for Italian wood-carving in the last century, are well known in this country—Barbetti and Pietro Cheloni, of Florence.

The former exhibits a grand door, carved with no less than 29 alto-reliefs of Biblical subjects, treated somewhat after the manner of the celebrated gates of Ghiberti. Unlike them, however, the sculptures under notice have been executed in walnut wood, as a commission for Prince Demidoff, for the entrance door to whose Russian chapel at San Donato, near Florence, they are intended. The general design is, it appears to me, monotonous, from its extreme rectangularity, and is ill-arranged in the junctions of the vertical and horizontal divisions with the semicircular head of the door. The carving is, however, executed in so masterly a style as to constrain an admiration for the details which fails to be excited by the general aspect of the whole.

The same artist contributes a large oak bench, the seat of which is hinged in order that the lower part may answer the purpose of the *cassapanca*, which formed so lending a feature in the Italian interiors of the quattro and cinquecento periods. In general design this work is better than the door just referred to, and leaves behind a feeling of more entire satisfaction.

The capability for the most important works, shown by these productions, is shortly destined to be put to an even loftier purpose, since Barbetti and his sons are now engaged in the execution of a magnificent case, 6 feet 6 inches high, entirely wrought in ivory and ebony, to hold the National Crown of Italy. Of this most important work a full-sized water-color drawing was exhibited, and I fully believe that the realisation of the design (which is exceedingly good) will be not unworthy of the ancient glories of Italian ornamental carving.

Cheloni works in a manner which very perfectly reproduces the delicate work of Mino da Pisevole civitale da Lucca and Andrea Ferrucci, and proves that, with judicious encouragement, he may become a formidable rival to the most distinguished amongst the Parisian magnates in the production of luxurious furniture. His bookcase—and above all, a single little panel in wood, fully justifies this assertion. It is to be hoped that this fine bookcase, as well as the ease for containing the national crown, by Barbetti, may form ornaments in our Exhibition next year, where they cannot fail, I think, to be greatly admired.

The only rivals, although there are, of course, many approaching the excellence of Barbetti and Cheloni in ornamental carving, are Antonio Superchi, of Parma, and Professor Giusti, of Sienna. The former exhibits only a small panel, carved in soft wood, with arabesque ornament. It is, however, a masterpiece. The latter works in ivory, and appears to be well supported by English patronage, since his miniature reproduction of the celebrated Fountain of Jacopo della Quercia at Sienna, and his exquisite little picture frame, have been produced, the former for the Earl of Northesk, and the latter for the Marquis of Northampton. For the Count Agostino da Gori Giusti he has wrought a little coffer or box to contain autographs of men of science, artists, poets, &c. The shrine is by no means unworthy of the relics.

Time will not permit of my dwelling at greater length upon individual specimens, or even extending my catalogue of ingenious artists. It may suffice to say, briefly, that in marble, stone, ivory, ebony, and plastic compositions, the application of sculpture to industry forms, probably, the most distinguished feature of the industrial portion of the Florentine Exhibition.

It would be unfair to the Italians to pass from the subject of applied sculpture, without noticing one form of it in which, from classical times to the present, they have maintained a decided pre-eminence over other nations. I allude to the art of working in gems and precious stones.

The names of Girometti and Odelli of Rome, are celebrated, and their productions still command very high prices, in proportion, perhaps, to the labor, but too great for the art displayed; as, for instance, the single cameo of Signor Girometti is valued at no less than 30,000 francs, or £1,200, a price, possibly, as the Italians say, "da combinarsi." Neither of these artists, in my judgment, sustains his previously acquired reputation, while the intaglios of Berini of Milan, a less known man, are, if not so valuable, far more agreeable, being both designed and wrought in better taste, and rather reproducing Grecian than ancient Roman styles of execution.

The old celebrity of Valerio Vicenti for the execution of intaglios in crystal, resting not only on the warm tribute of admiration paid to his genius by Vasari, but on exquisite relics of his skill still preserved at Naples, Rome, and Florence, has excited the noble emulation of Beltrami, of Cremona, a very beautiful specimen of whose handicraft is exhibited by the Brothers Turina. I believe Beltrami to be no longer living.

The medallie art of Italy, so famous of old through the dies cut by Cellini, Bastiano Cennini, and others, is well sustained in the present day, and the specimens furnished by the mints of Florence and Rome show that their ancient dexterity has not entirely deserted their descendants.

Before altogether quitting the fine arts, there are some forms in which they appear so closely allied to industrial art, and in their alliance so little modified, as to demand notice, before proceeding to a consideration of those industries, the types and constitution of which are affected comparatively remotely by the three fine arts. I class in the former of these categories engraving, lithography, chromo-lithography, and photography.

From the days of Mare, Antonio Raimondi, through those of Volpato and Raphael Morghen, to modern times, rendered illustrious by the names of Peretti, Jesi, and Tosehi, the Italian school of line engraving has maintained an almost unquestioned pre-eminence over its contemporaries of the rest of Europe. That great work, the engraving of the Frescoes of Correggio at Parma, upon which all the later years of Toschi's life were employed, contributed to the education of a generation of engravers, many of whose works are fully worthy of their cultivated master.

The basis of all excellence in this art is, of course, the perfection of what is known as the engraver's drawing—in other words, his rendering in *chiaroscuro* (of the exact size of the plate proposed to be produced) of the picture selected for reproduction on steel or copper. In this art the Italians have greatly excelled, and do so still, since it would be scarcely possible in this way to surpass such a drawing, for instance, as that by Calamatta of Raffaele's "Madonna di Foligno."

For perfection in soft and fleshy modelling the palm must, I think, unquestionably be given to Tosehi, for his print of the Madonna della Scala, by Correggio; and Tommaso Aloysio Juvars, the leader of the Neapolitan school, several of whose minor specimens are of extraordinary excellence, must, I think, be placed next in order of merit.

Of Toschi's old assistants on the Parmesan Correggios, Peretti of Florence, Scotto of Genoa, and Calamatta of Civita Vecchia, many agreeable specimens are exhibited; and the print of the Madonna della Seggiola, by the first-named, is worthy of high commendation.

A work now in progress on the gallery at Florence, and most creditable as a current Italian publication, appears to have given employment to many of the best contemporary engravers, and beautiful plates as well as engraver's drawings for this work are exhibited by Ulisse Forni, Federico Calendi, and Agostino Tricca.

I cannot leave the subject of Italian engraving without noticing the extraordinary pen-and-ink drawings by Professor Vincenzo Gazzotto of Padua. On three large sheets this artist has depicted, in a most masterly manner, the "Joys of Paradise," the "Sufferings of Purgatory," and the "Despair of Hell." Not only are these compositions highly imaginative—in this respect rivaling the

analogous works of our own Martin—but they are drawn with a masterly knowledge of light and shade, fore-shortening, and of the human figure. The drawing of Paradise is exceedingly beautiful.

In chalk and ink lithography, a fair average is maintained by the houses of Richter, of Naples; Carpentier, of Florence; and Borzino, of Milan; while in chromo-lithography they may safely be put in comparison in quality, if not in quantity of production, with the larger establishments of Paris, Vienna, Berlin, and London.

By the first-named house two works are exhibited, the execution of which is eminently honorable to Italy at the present time. One of these is a perfect series of illustrations of the painted decorations of Pompeii, published by Nicolini, being for the most part *fac-similes* of the beautiful drawings of Abbate. The other is an equally fine series of illustrations of the Abbey of Momeale, near Palermo. The latter work has been produced mainly through the energies of the Benedictine Fathers of the Abbey, under the able leadership of the Padre Gravina. For those who would seek to revive the manufacture of pictorial mosaics in this country—and, happily, they are now many—no more useful work can be recommended than this, in which the glories of the celebrated Norman Cathedral are admirably reproduced in all their details. Borzino's imitations of oil pictures are all but deceptive; while Carpentier produces, at very reasonable prices, excellent colored *souvenirs* of the most beautiful pictures of Fra Angelico and other masters.

The illuminator's art is so nearly allied to the art of chromo-lithography, that I may consider this to be the fittest place to notice the evidence given by Napoleone Verga of Perugia, that the traditional skill of the Italians in "quell'arte che alluminare e chiamata a Parisi," from the days of Dante to the end of the last century, has not been lost. In his illuminated addresses from the municipality to the Marchese Pepoli, Verga shows himself, if somewhat inferior to Giulio Clevio, Buonfratelli, and Girolamo dai Libri, superior to almost all other ancient magnates in the art of illumination on vellum.

As connected also with chromo-lithography, may be noticed the art of color-printing by means of typography (*alluminare e chiamata*), that is, from type or brass plate. Of this some good specimens were shown by Federico Lao.

Raffaello Salari, of Florence, contributed fac-similes, executed with the pen, of ancient block and other early printing and wood-cut illustrations, fully sufficient to deceive any eyes but those of the most accomplished bibliomaniacs, their perfection equalling, if not exceeding, that of our justly-celebrated Harris, whose works created so much sensation among the learned in rare editions and tall copies in 1851.

In photography the names of Ponte of Venice, Alinari of Florence, and Dovizielli of Rome, are well known in this country as connected with very perfect reproductions of the most striking architectural monuments of those cities. It may be enough to say that they ably sustain their reputation amidst rivals whose excellence brings them within a few paces of the foremost in the race. Daroni of Milan, exhibits a full-length life-size figure of the king, in its way a triumph over very great difficulties. A less favorable subject, however, for such an experiment could hardly have been selected. Caldesi's reproductions of the Hampton Court cartoons are too well known to need commendation from me.

In metallic art there was not much to notice, since none of the branches of that class of industry were very largely represented.

In the precious metals much more design and ingenuity were displayed than—with one or two exceptions, to be presently mentioned—appear in productions in the baser metals. I am unable to praise the silversmiths' work generally, since the Italians as yet do not appear to have fully appreciated the ancient styles of finish of their own forefathers, or even those of the Wagners, Froment-Meurices, Morels, and Vechtes, of the past and present generations in other countries. The best works of this kind, where little was really good, appeared to be the vase designed and executed by Tomase Rinaldi of Modena, and the sword of honor presented to the King by the citizens of Modena, and executed by Rinzi, of Milan. The steel blade of the latter, which was cleverly inlaid with gold and silver, showed that the whole art of working *all'azzimina*, or damascening, in which Cellini so greatly excelled, is not lost in Italy.

A still nobler sword than this, as far as material is concerned, was exhibited, the work of Castellani, of Rome. The hilt was somewhat too severe in style for one wrought in gold, and did not appear to me equal in workmanship to much that I have seen elsewhere, and, indeed, in London last season, by the same distinguished jeweller. It is to be regretted that he did not contribute any other specimen of his skill on the present occasion. I must confess that I have seen in shops at Rome, Genoa, Florence, and Naples, far better jewellery than was displayed in this the first great Italian Industrial Exhibition, where so important a branch of industry should have been better represented.

In cast-iron there was little worthy of remark, with the exception of a very clever gas lantern, cast at the foundry at Pignone, near Florence.

In bronze and brass founding and chasing, I have never seen in any country better work produced than that for which Clemente Papi, of Florence, is so justly renowned; and I believe that it has puzzled those most learned in the processes of metal casting to understand by what means his extraordinary reproductions of groups of natural flowers have been made out of molten metal.

In wrought-iron, for which I need scarcely remind you that Florence and Siena were formerly most celebrated, Pasquale Franchi, and Benedetto Zalaffi (both of the latter city), exhibit themselves as truly cunning smiths. The former has produced a small pair of gates, in which the vine, the olive, and groups of corn, become admirable ornaments to a well arranged series of conventional lines and ferns; while the latter sends some iron rings and brackets, similar to those formerly attached to the old palaces of Italy. These are all wrought with hammers and punches, with such freedom and spirit as to be likely enough to deceive enthusiastic purchasers who may be unable to refrain from attempting to carry off trophies of the former glories of those nobles, in whose families the right was alone hereditary to attach such marks of nobility to the head-quarters of their race.

In pierced steel-work the cutlery of Campo Basso, the only place in Italy in which much cutlery is manufactured, exhibit considerable dexterity, and the pierced scissors of Vinditte Terzano are elegant, both in design and execution. One singular pair of desk scissors, highly and pleasingly ornamented, bore the singular inscription, in incised characters, "Scipione Santangelo, al municipio di Firenze;" the gift recalling the good old days of Florence, when nothing was deemed too precious to be offered out of the tradesman's abundance to his well-loved home and city.*

ON THE SANITARY CONDITION OF THE DWELLINGS OF THE OPERATIVE CLASSES OF EDINBURGH.*

THE College transmitted the foregoing suggestions, with the apparently necessary recommendation that they be carried into effect with all convenient speed. Earlier than this, however, the Privy Council, moved by the fact that the town "is now become so filthy and unclean, and the streets, vennells, wynds, and closes thereof so overlaid and covered with middings, &c., that the Councillors are resolved to leave their lodgings," as "they cannot have a clean and free passage and entry to them," "nor to abide the sight of this shameful uncleanness and filthiness." The remedy suggested was to hold every householder responsible for the purity of the part in front of his own, as is now done in regard to the snow. Again, in 1751, on the fall of an old house, a general survey of the old houses throughout the city was made, and many of them were condemned and destroyed. The erection of George-square to the south, and of the streets and squares of the New Town, on the north, led to the removal of the wealthier inhabitants, and the abandonment of the Old Town, with its upright streets (*Scottie*, stairs), to the class who now occupy it, and in whose occupancy it has assumed its present barbarous and disgraceful condition. What do we find when we examine? Closes varying from $\frac{1}{2}$ to 1 foot in width, as they taper in some instances to meet at the top, seven and eight stories high; their causewayed surfaces, reeking with every kind of filth, are the only entrances by which light and air can find their way to the dwellers in these awful dens. Add to this the fact that some of these houses, once the residences of our nobility, have large rooms of goodly pretensions. These, however, would not pay, so they are divided by wooden partitions into family apartments, a few feet square. These inner cages have no direct communication even with that medium of light and air which finds its way through the narrow close. The old window of the ancient room is still left, the glass probably all gone, but all the light admitted to the inner dens comes through that window across a passage, and then through a square hole cut in the partition, so that I assert, without fear of contradiction, that when it was broad daylight outside I could not see my hand held at arm's length before me in many of these houses, which were solely dependent on such borrowed light. Again, many of these houses are of very old date indeed. One in Dickson's-close, which I examined, is described by Wilson ("Memorials of Edinburgh") "as a neat and very substantial stone edifice, evidently the work of Robert Mylne, and built about the period of the Reformation." Here was the residence of David Allan, "our Scottish Hogarth," as he was called, and who in 1788 gave lessons in drawing in this very house at the rate of one guinea per month for three lessons a week, terms which shew the wealthy character of his pupils. One small room in this house, not 12 feet wide, has a gradient of 9½ inches from front to back, a great crack extends through the wall, the lintels of the doorways are all cracked, the doors have been repeatedly stripped to make them fit. I produce a bit of one of the beams, which crumbles between your fingers like snuff. It seems to be imagined that the materials of which our houses are constructed are exempt from the universal law of decay, and that, once built, they should stand for ever. Often, when thoroughly unsafe, they give no sign of their utter rottenness. I visited one in another part of the town which had been purchased for, and was being adapted to, a particular purpose. A substantial-looking tenement it was, with walls 4 feet in thickness. The architect who planned the alterations fortunately caused the main beam supporting the roof to be examined; it was utterly rotten. I show you a piece of it; at its junction with the wall it had given way (the place, I believe, where such accidents usually occur), and the whole roof had to be shored up with temporary supports. A good illustration of the length of time these beams may remain in a very unsafe condition without external indications of decay was afforded in the picture gallery of Holyrood Palace. The flooring of this long room had been repeatedly repaired, and on the occasion of the annual levees given by his Grace the Commissioner, was temporarily supported from below. It was resolved, however, to new floor the whole; and on the planking being removed, the beams which had clung to instead of supporting the floor actually gave way, and three of the workmen were precipitated into the chambers below. It is more than probable, then, that many houses built about the time of the one that lately fell, or the one in Dickson's-close, likely so soon to fall, are in a similar unsafe condition. I have placed before you roughly-executed sketches of some of these houses. From being originally built to serve a different purpose, many of them are singularly ill adapted for subdivision, and peculiarly unsuited for the residence of poor families. Of this Cant's-close forms a good example. It appears, according to Wilson, to have been occupied in early times by ecclesiastical buildings in connection with the church of Crichton. Entrance to the rooms is afforded by good circular staircases, but the thin partitioned subdivisions are as comfortless as can be imagined; many of them have their light and air from borrowed lights, and in others, where the old windows have been rendered available, they are stuck in the queerest corners, as if placed designedly, so as to be of as little service as possible. Thus, this room, of which I show you a drawing, is 11 feet 10 inches by 9 feet 2 inches, its height being 8½ feet, and the window, 27 inches wide, is found in the extreme corner, protected from all extravagance in the admission of light or air by the close proximity of the wall on the other side, so there is only a clear space of 3½ feet between the two sides—narrowed in some places by projections to only 2½ feet. In another house, in Campbell's-close, the room is 15 feet 3 inches long by 7 feet 7 inches wide, and the only window, 1½ feet in width, is at the extreme corner of the room. Another peculiarity is shown in the first of these rooms; the large, deep, old-fashioned angle corner, which before the subdivision belonged to the whole apartment, has fallen to the lot of this particular room, and a hole 1 foot 2 inches wide has been cut through the solid wall at the side angle and glazed, so that the light struggles through from the back of the fire, and the eyes of the inhabitants are protected from any glare by a thick curtain of intervening smoke. In the room in the drawing this appears as an additional window; in some, I am informed, it is the only one the apartment possesses. Take another room in Cant's-close. It is formed out of a larger room by wooden partitions quite open, and its entrance closed by an ill-fitting door, there being a clear space of at least 3 inches between the door and the lintel. It has no direct communication whatever with the external air, but borrows all its light from the window of the larger room of which it forms a part, through a window 2 feet 5 inches in width. The light must first struggle into that outer window through a high close only 3½ feet wide, and then cross a passage of 5 feet before reaching the window proper of the room at all. The height of this room is 9 feet, and a family of five live in it, paying a rent of

* To be continued.

CRICKET MALHERBIE CHURCH, ILMINSTER, SOMERSET.—MR. J. MOUNTFORD ALLEN, ARCHITECT.

It is the first time that the Hilltop News has been able to publish a special issue. The reason for this is that the paper has been able to secure a large number of contributions from its readers. These contributions have been of a high quality and have been of great interest to the community. The paper has been able to publish these contributions in a special issue, which is a great honor for the paper and its readers. The paper has been able to publish these contributions in a special issue, which is a great honor for the paper and its readers. The paper has been able to publish these contributions in a special issue, which is a great honor for the paper and its readers.

The Hilltop News is a weekly publication that is published by the Hilltop News Association. The paper is published in the town of Hilltop, which is located in the state of New York. The paper is published in the town of Hilltop, which is located in the state of New York. The paper is published in the town of Hilltop, which is located in the state of New York.

1s. 4d. per week, or £3 11s. 6d. per annum. There is no room for a bed by day, but at night, when the embers are raked out of the hearth, one is folded down across it. We could not see one another in this room till artificial light was obtained. The last drawing to which I direct you exhibits a transverse section of a garret in Campbell's-close. It is only 6 feet high at the highest part, and the eaves slope rapidly down. It is lighted and aired by a hole at the end about a foot square. All told us of the stifling heat of summer, but complained far more of the cold gales of winter; for the outer windows, opening on the closes outside, and only on passages within, are destitute of glass, and the old, rotten, ill-fitted partitions are utterly insufficient to keep out the external air. The rents vary from 1s. to 4s. per week; they are collected (sometimes two weeks) in advance, and a universal complaint is made of the impossibility of getting the landlords to do anything for the comfort of the tenants. The fact is, these houses are in most instances let as a whole to middlemen, many of them coarse, unfeeling men, who, charging often an advance of 20 per cent. on the rents they pay, grind the faces of the poor, and get rich on the sufferings and miseries of their fellow-creatures. Mr. Peddie, who visits a district bounded by the High Calton and North Back of Canongate on the north, New-street on the east, Canongate on the south, and Leith Wynd on the west, informs me that this district contains about 560 houses, and nearly 500 families. There are about thirty cases of two families living in one house, and about fifteen with two families in the same room. Of these houses, about 200 are good and comfortable for working people, with rents from £7 to £10. About 180 are at present in such a state as to be hurtful to the moral and physical character of the inhabitants; but, if supplied with water, and altered so as to admit a sufficient supply of light and air, they might be allowed to be inhabited—rents, from £3 to £6. Another 180 are utterly deficient in size, air, light and water, and every necessary element of health, many of them dangerous from their age and rickety condition—the rents varying from 1s. to 2s. per week. About twenty families live in damp, ill-ventilated cellars, below the surface of the street. Many other dwellings (!) of similar character were described by the speaker, who said, in conclusion, let it be remembered that these houses are utterly destitute of water or soil-pipes, and some idea of their loathsome character may be formed, and of the moral and physical degradation in which their inmates must be sunk. From such abodes you issue half-suffocated, and cease to wonder, when you analyse your feelings, and when you consider what an amount of physical depression the habitual dwelling in such an atmosphere must engender, that the gin-palace, or, worse still, the hard-ale shop, close by, is crowded to the door by eager votaries. Would I be myself better in similar circumstances is the question each may well ask himself; and as we know the influence of the surrounding moral atmosphere on the character of all, can we wonder if in such localities the moral as well as the physical life languishes, and ignorance, idleness, and immorality prevail? If you treat human beings worse than beasts, what can you expect them to become? If the object of this paper were not limited to the consideration of the sanitary condition of the dwelling-houses alone, I might proceed to show that, besides neglecting the peculiar advantages for drainage furnished by the site of our city, and besides suffering our houses to lapse into the condition which has been indicated, we have suffered the river which flows through our New Town (partly by the division of its natural waters, and partly by opening into it our drains,) to become, during a great part of the year, an open and offensive sewer. Farther, how, as if we had a prejudice against fresh air, we suffered the sewage water of the town to be diffused over about 2,000 acres of irrigated land, so that the emanations from about 37,120,000 square feet of poisonous swamp—which, if science have any truth, must be injurious to health—are carried to our dwellings by the east wind, which here blows on an average 135 days in the year, or by the west wind, which favors us with about 230 days; but on these I shall not dwell. To use professional language, I have described the disease and its symptoms, but how shall I prescribe a remedy? The case, I say, admits neither of palliatives nor restoratives. A surgical operation is essential, the diseased member must be removed—*Delenda est Carthago*. The recent calamity has aroused attention, and but one remedy has been suggested—the erection of new houses for the working-classes; but that this may be largely undertaken, it must be proved to be a safe and profitable commercial speculation. Those that have hitherto been built have paid well, because they are few in number and new, requiring as yet little outlay for repair, and all inhabited by a class of tenants much superior to those whose condition we desire to relieve. After referring to the fact that the new houses erected had done but little towards improving the condition of the Old Town, and expressing a doubt as to the efficiency of the plan proposed by the Town Council, the author continued: I think the urgency of the case imperatively calls for a Royal Commission, very small in number, as the only body calculated to meet the emergency, and we have an analogy for their appointment. In 1846, her Majesty issued a Royal Commission appointing certain gentlemen to inquire whether any or what special means may be requisite for the improvement of the health of the metropolis, and a similar body might be appointed to inquire into the house accommodation of Edinburgh. We ought to tell the Legislature plainly and strongly that the present is a state of matters which cannot be permitted to continue; that no man, for the mere sake of gain, has a right selfishly to disregard the interests of his neighbours; and that if the proprietors of such dwelling-houses are not sufficiently alive to the fact that by their culpable negligence or cupidity they are sacrificing the lives of hundreds, and casting the burden of the maintenance of hundreds more on their fellow-citizens, they must be prevented from continuing so foul a wrong, and made to understand that universally acknowledged maxim of public law—*Sic utere tuo, ut non alienum laedas*. The great lawgiver of the Israelites has given his divine sanction to such regard to the lives of others when he proclaimed, amidst the thunders of Sinai, as one of the laws of his peculiar people, "When thou buildest a new house, then thou shalt make a battlement for thy roof, that thou bring not blood upon thine house if any man fall from thence."

At the close of a discussion which followed the reading of the paper, Dr. Wood said that the health of Edinburgh was better than that of the other towns in Scotland, but it was not better than Birmingham.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post* Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 45 and 47, Cornhill, London, E.C. Established 1749.

ON PUBLIC MEMORIALS.*

GOING back to the architecture of the Romans, we find that they have furnished us with the originals of another class of buildings sometimes used for this purpose, but not, upon the whole, generally suited for it; although in particular positions, where such a structure is needed, it may be appropriate, and add great grandeur to entrances of parks, or towns, or other approaches: these are triumphal arches, as they are usually called; although by no means universally used for that purpose, many of them having been erected to commemorate either the original construction or an important improvement or restoration of a public road, any ruler being rightly considered a great benefactor to his people who devoted his attention to these important works. Thus we find one at Rimini, erected in honor of an important restoration of the Flaminian Way by Augustus; one at Susa, in Piedmont, to commemorate another restoration of the road there by the same emperor. When the harbor at Ancona was restored by Trajan, he erected the gateway still to be seen there, and another at Beneventum, when he repaired the Via Appia. At Pola, in Istria, another was erected for a similar purpose.

At Athens, and Antioch, in Egypt, Hadrian erected arches to commemorate what he had done for those cities by the buildings he had erected in them.

But at Rome these arches were mostly used to commemorate a triumph which had passed along the road over which they were built, or they were erected in time for the triumphal procession to pass through, and then remain as memorials of the triumph. Examples of these are that of Titus, erected to commemorate the conquest of Jerusalem, and representing in its bas-relief the spoils of the temple. The arch of Septimius Severus, which shows the addition, as was the custom in the latter days of the empire, of a smaller arch on each side for the footways; and the arch of Constantine. They were sometimes used as entrances, and also to commemorate the building of the Roman bridges erected in Italy, France, Spain, and other parts of the world, as you well know such arches have been, in consequence of the renaissance of Roman art, erected in London, in Paris, and other cities; the most recent as well as one of the finest examples is at the entrance from the country to the Ludwig Strasse, at Munich, the design of which is very good, and the group of Bavaria in her car, drawn by lions, is very suitable to its position, and effective in its outline, and its grouping being, from its facing the same direction as the front of the arch, and yet, from the spreading nature of the group sufficiently covering the whole width of the arch, a much more appropriate and graceful example of sculpture surmounting an arch than ours of the Iron Duke, which necessarily, from its form and sideway position, is singularly inappropriate.

As carrying out the very spirit of the principle of the use of these arches both for entrances and for memorials, although in a Gothic style, may be cited the Tsar Thor in the same city, it being the gate of the town, and yet its whole façade being covered with historical frescoes.

Although they can hardly be called public memorials, as, although memorials of public men, they were erected either by themselves during their lifetime or by their own families after their death, some instruction, in the spirit in which we are now getting to view the instruction to be derived from the examples of old times, may be learnt from the tombs of the older nations.

Certainly, if a lasting memorial is to be desired, something is to be learnt as to the value of stability in these erections, and of the means of obtaining it, and something of simple grandeur of effect, from the first tombs of the Egyptian Kings, the Pyramids—something of the historical value of enduring memorials in these rock-cut tombs; but from these little can be learnt of forms suitable for the purposes. From the Greeks little is to be learnt on this head, but among the tombs of the Romans are to be found many grand, and some few appropriate, forms for our purpose. Those to the Emperors and other grand personages are fine; one, however, before the empire, that of Cecilia Metella, is of a very grand and effective form,—that of a round tower about 94 feet in diameter, with a bold frieze and cornice mounted on a square base about 100 feet square. That of Augustus consisted of a circular basement about 300 feet in diameter, and about 60 feet in height, adorned with twelve large niches; above this rose a cone of earth, divided into terraces and planted with trees. Augustus laid out the grounds surrounding his tomb and planted them in gardens for public use during his lifetime. That of Hadrian, built by himself, is now the Castle of St. Angelo; its basement originally was a square about 340 feet each way, and 75 high; above this was a circular tower about 235 feet in diameter and 140 feet high: the circular part was ornamented with columns. In the age of Constantine the smaller tombs became like smaller representations of the Pantheon.

One of the illustrations in Mr. Fergusson's Handbook shows us a very singular example at St. Remi, in France, which comes more within our subject, and seems to give us a classical type of our memorial crosses. It stands on a square base decorated with bas-reliefs; the next stage is pierced with an arch on each face, with three-quarter Corinthian columns at each angle; the uppermost story consists of an open circular colonnade with a conical top. Another at Igel, near Treves, in Germany, is of a very singular form; this is a square building, ornamented with sculpture, with flat pilasters, cornice, and pediment, raised from its usual place to the level of the springing of an ogee spire, so as to resemble those church spires that are surrounded by four gables; this form very fully leads us to the consideration of another kind of memorial, which, in general outline, these last examples much resemble. There is no form in my mind so suited for public memorials as the medieval form of memorial cross; there is room and scope for sculpture of every kind in the basement; there can be bas-reliefs in the niches, subordinate figures connected with the main figure; or, if an event is recorded, the statues of the several persons principally engaged in it, while above may be the principal figure of the subject of the memorial, much protected from the weather, and the whole elegantly surmounted by a spire. A beautiful example of a structure of this kind is the Shrine Brunnen, or beautiful fountain at Nuremberg, which, again, shows a graceful combination of an architectural structure suitable for a memorial with the uses of a street drinking fountain. This is mounted on two steps, in the form of an octagon, and surrounded above the steps by rich stone railing, at the angles of which are figures on short pedestals. If a public memorial be erected in our large churches or metropolitan churches or cathedrals, by all means let such memorials be more of a tomb than that of the usual form of memorial, and, above all, let it be in the style of the building in which it is placed, and, if possible, let it be so appropriate and so carefully designed for its special place that it may appear rather as an architectural adornment, and as if the original architect of the building had placed it there himself, and not such as he, if he were living, would expel indignantly from the church, and such as many of us would much like to have a hand in helping him to do it. I need hardly say to you what was so much wanted not many years ago: never design your modern memorial so as to require the defacing, even in the slightest degree, of the older building in which it is placed.

No men have ever understood the designing of tombs and memorial effigies of the notable men of their time better than the architects and designers of the middle ages, especially as regards their suitability to the churches in which there were placed chapels may be crowded with them, and arches filled by them. Arches may be made in the walls for them, or the floors of the aisles covered with them, yet the only result is that the beauty and picturesque effect of the building have been much increased by them; for monuments like these our remarkable series of altar tombs of our kings, with their beautiful effigies in calm repose, are sufficient examples, which may be varied in treatment and detail to an almost endless degree: those at Westminster, both of kings and knights, with their beautiful canopies; those, again, of the Scala family at Verona, and that of Walter Gray at York, and the Beauchamp tomb at Warwick, are fine examples of different modes of treatment. A beautiful form of memorial for the interior of a church is a brass, but unless protected by a railing, it seems to me that the wall of the building in which it is erected is better than the pavement.

There is one mode of memorial by which architecture is a great gainer, and by the aid of the custom of using which for that purpose many a church, which would not otherwise be completed, is finished and beautified,—that is, of inserting stained glass into the windows as memorials; it is a beautiful mode of recording the person, and of, at the same time, adorning God's house. I do not think that there is anything particular to be remembered in designing these; the design may be, if possible, appropriate, but, if not possible, it does not matter. Of course the subject must be sacred. The inscriptions are generally so difficult to read, that I think it is best to insure

the memorial intentions of the window, as well as the decoration, by placing underneath a brass containing the inscription.

By all means, for the sake of the beauty of your buildings, encourage, whenever it is in your power, this beautiful mode of recording the great and good. To use a homely proverb, "two birds are killed with one stone." I would just say here what I always urge when I have the opportunity of saying anything about stained glass: let no one color predominate, and do not attempt to make a historically recording fresco out of a painted glass window, for the material will not admit of it; color is its chief and most legitimate object; leave all the rest to fresco itself.

Memorials of events seem to me to be even richer in opportunity for design than memorials of public men; for your principal sculpture, whether on a pedestal or on whatever kind of structure it may be reared, may then consist of a group, either typical or descriptive of the event, and not of a single man.

A good instance of what may be done in this way is the beautiful group of the memorial to the inventor of printing, Johan Gattenberg, which, although erected as a memorial to him, will show you what I mean, as it introduces his two companions, Faust and Schœffer, grouped on each side of the main figure. Of the beauty of this you may yourselves judge at the Crystal Palace.

I cannot conclude a paper upon this subject without alluding to the idea carried out by King Ludwig, of Bavaria, in two buildings, one at his capital, Munich, and the other at Ratibon; the one at Ratibon I have not seen, being obliged, when in Bavaria, to change my route; but the one at Munich was nearly finished when I was there in 1852. These buildings are the Walhalla, at Ratibon, and the Ruhmeshalle, or Hall of Fame, at Munich. The purpose of these buildings is to contain the statues and busts of the men who may have distinguished themselves and deserved well of their country; and I think the idea is good. And if a similar institution had been founded in our country, Westminster Abbey might have been saved many an incongruous statue.

The building at Munich stands on a considerable eminence outside the town, and consists of a long, low white marble portico of Doric columns raised on many steps; it is massive and grand looking. Although I think that had it been higher it would have been more effective; but, no doubt, when it is filled, in time, with the many busts and statues it is destined to receive, the appearance will be much enriched. In front of it is the celebrated statue of Bavaria, appropriately extending her arm to crown with a wreath which she bears in her hand her brave and illustrious sons. As the great master, from whose poetic and fertile brain this beautiful statue proceeded, did not live to see it erected on its pedestal, his honored form was, no doubt, one of the first to be erected in the Hall of Fame.

This figure of Bavaria is 54 feet high, and the pedestal is 30 feet high, making in all a height of 114 feet. The seated lion at her side is 27 feet high. The casting was a work of great difficulty: it was begun in 1844, and completed in various portions in 1848. It was placed on its pedestal and exhibited to the people on October the 9th, 1850, and you will find the ceremony pleasingly and graphically described in Miss Howitt's interesting little work, "The Art-Student in Munich."

Both Schwanthaller, the designer, and Stieglmayer, the greatest worker in bronze in Europe, who commenced the superintendence of the casting, died while the work was in progress, so that the rejoicings were in some measure clouded with sorrow.

This dedicating one building to the purpose of commemorating the great men of the country is a very good idea, and capable of great variation and extension; for, not only may a building be erected on purpose with an open portico, so that every statue added may increase and enrich the beauty of the façade, but this principle may be applied to special appropriate buildings, where the spaces for sculpture have been left, when, one after the other, statues of the eminent in the same calling or branch of public service to which the building is dedicated may, one by one, be added, greatly to the increase of the beauty of the building. Also halls might be erected, which, although containing nothing but portrait statues and busts, and commemorative bas-reliefs, would yet, if always open to the public, answer the double purpose of a hall of fame and a sculpture gallery. Likewise the same idea might be carried out with painting; a national portrait gallery, placed in a grand and suitable building, and interspersed with historical and illustrative pictures, would also serve the double purpose of a pictorial hall of fame and a picture gallery. But before quitting the subject, I must touch upon one or two essential qualities which such memorials as those of which I have been speaking ought all of them, of whatever particular form, to possess.

They ought to be poetical in conception; but in this very thing there is great care required; the idea to be conveyed, or the event to be commemorated, may be well and fitly embodied in some poetical or allegorical form; but I think I have only to ask you to think for a moment on the absurdities that from time to time have crept into our monuments through an indulgence in embodiment of classical mythology, sufficiently to warn you of the danger of this.

Although one of the most artistic monuments lately erected is that of Frederick the Great, inaugurated at Berlin in May, 1851, designed by Professor Schinkel, the architect, and Professor Rauch, the sculptor, yet some of the bas-reliefs will, I think, afford us an example to avoid in this respect as well as to emulate.

What I see to avoid will be seen in the following description of the bas-reliefs in the Hand-book to the Crystal Palace:—

1st. The first represents Frederick, who is presented by a good genius to his parents.

2nd. The Muse of History instructs him and rouses his ambition by unfolding the names and deeds of the heroes of old.

3rd. He receives his arms from Pallas.

4th. He is examining the web of a weaver of Silesia, famous for its linens.—This subject expresses his encouragement of manufacturers.

5th. He is leisurely playing the flute.—Frederick not only patronised music, but was himself an excellent performer on the flute.

6th. He is seated in his cabinet at Sans Souci, an attendant places before him the celebrated bronze statue of the praying boy, for which he paid a sum amounting to £25,000, and which is now a principal ornament of the Museum at Berlin.—This subject expresses his patronage of the fine arts; the greyhounds at his feet are also characteristic.

7th. The bas-relief at the south end represents the King seated on the column at Culmbach, and meditating on the vicissitudes of war.

8th. The bas-relief at the east represents his apotheosis, where, seated on an eagle, he is borne into the regions of immortality.—Admirable! Would that a description of any pedestal on which any of our statues are placed would need such a description, and present such a catalogue. Then the subjects; do they not, as I have endeavored to show ought always to be done, set forth the character and history of the man, from his cradle to his grave?—have we not his eminence and fame related, his early aptitude for arms forcibly depicted, showing that to be the principal occupation of his life? Then are we shown, lest we should think he was nothing but a soldier, that he not only patronised, but practised, the softer art of music—that he encouraged manufactures and the arts—that he did not thoughtlessly engage in war, and that his fame will live. Yes, truly admirable! Truly an example of what sculpture can do to render a memorial truly commemorative. Then, what is the fault, and why do I take this admirable work as an instance of the danger of mythological and allegorical sculpture? For this reason: That, with all its beauty, we have here such a medley of genies, muses, goddesses, and eagles, high boot, modern coats, waistcoats, pigtails, and cock hats, that, beautiful as the memorial is, it seems to me to say plainly to all designers of such structures, make up your mind which you will do, either let the bas-reliefs represent historical facts alone—in which case use the costumes properly belonging to the date represented—or let them be entirely poetical or allegorical.

As you all know, both a small model of the whole of this memorial and full-sized cast of the equestrian statue are in the Crystal Palace.

Recurring to the requisite qualities of memorials, they ought not only to be poetical but beautiful, and in their very nature to be beautiful they must fully combine an architectural with a sculptural character. This necessarily involves an artistic and professional difficulty—an artistic difficulty, as, at the present time, owing to the present mode of study, few, if any of us, either architects or sculptors, are capable of the twofold work of designing true work of architecture and executing, at the same time, with our own hands, the figure sculpture; the professional difficulty is, that there must be choice of either sculptors or architects. Therefore I think at the present time that the example set in the above mentioned memorial to Frederick, of two men being employed, one an eminent architect and the other an eminent sculptor, to be conjoint designers of the work, is a good one.

But I think, in this specially debatable ground between sculpture and architecture, that a completely open competition is the best means of bringing out the best suggestions and the special order of talent most needed in this class of structure; and if a design combining both the highest standard of true architectural composition to be found amongst all the designs, with the most beautiful sculpture, be the work of a sculptor, let him by all means be employed to carry out the whole of the work; but if, on the other hand, the work that most of all the designs sent in combines these two most necessary qualities be the work of an architect, let him by all means undertake the superintendence of the work, and let it be left to him to appoint what really competent sculptor he pleases to execute the sculptor's part of the work. By this test alone, applied before the selection of the memorial, and not afterwards, in the shape of criticism, can we insure for the future that completeness and perfection of design and composition, as well as well-executed figures for which our sculptors have been long justly celebrated, that those who watch the progress of art have a just right to look for in our public memorials.

ON THE ESSENTIALS OF A HEALTHY DWELLING AND THE EXTENSION OF ITS BENEFITS TO THE LABORING POPULATION.*

UNNECESSARY as it is for me to describe to you the component parts of the air, the process of its deterioration in passing through the lungs, or to dwell further upon those sources of impurity and other accessory influences in and about a dwelling which tend to vitiate the air within, it may be useful, before giving the results of my own observations on the means of obtaining efficient ventilation, that I should notice one important preliminary consideration, that of the space required to keep a healthy man in full vigor, on which very different opinions have been expressed. Experience gained in poorhouse dormitories, in prisons, &c., has led to the conclusion that from 450 to 500 cubic feet are requisite, and that the ventilation should be such as will cause an entire renewal of the air, about once in the hour. Observations made at the Model Lodging-house, in George-street, St. Giles's, which is a confined situation, satisfy me that the cubical space of 535 feet, which is provided in the dormitories of that building for each inmate, is, with proper ventilation, abundantly sufficient to render them healthy; such was proved to be the case, even when the cholera raged in the neighbourhood, and had not a single victim out of the 104 men who lodged within its walls. From this fact I think it reasonable to infer that the unhealthiness of the Wellington Barracks, Westminster, where the cubical space per man allowed in the dormitories is stated to be 500 feet, must have arisen, not from want of space, but from some other existing evils, particularly the defective ventilation, pointed out in the report made to the General Board of Health by the Commission on Warming and Ventilation.

As mistakes with regard to space tend to create imaginary difficulties, and either impede sanitary reform, or cause a serious unnecessary expenditure, I think it of use to notice two recent errors on this point which have come under my observation—one in the *Quarterly Review*, where, in an article on "Laborers' Homes," it is stated that "The Lodging-house Act requires an allowance of 700 cubic feet per person;" another in a publication by Dr. Druitt, entitled "The Health of the Parish," where it is said that "It has been decided at Bow-street that every inmate of a family ought to have 400 cubic feet of space." On inquiring at Bow-street as to the latter decision, I learned that the magistrates have no power to determine the space, and was referred to the Assistant Commissioner of Police, who informed me "that 30 feet superficial is the space allowed to each lodger in the metropolitan common lodging-houses, the rooms averaging 8 feet high, which is equal to 240 feet cube, and that 50 feet superficial is allowed to each police-constable lodged in a station or section-house, the rooms on an average being 9 feet high," which is equal to 450 cubic feet. The Poor Law Board, without laying down any fixed rule, applicable to all circumstances, adopts as a basis of calculation an allowance of 500 cubic feet for every person in sick wards, and 300 cubic feet for every healthy person in the dormitories.

Dwellings for all classes of persons, in order to their being healthy, should be so constructed as that they will be everywhere accessible to pure air, and be free from stagnation in any part; and, whilst it is obvious that the state of the surrounding air must have much influence on that within the dwelling, the renewal of the latter should always be sought from the purest source, instead of the supply being drawn, as it often is, from a low damp situation or a confined internal court.

Considered practically, the main question with regard to ventilation is in what way the air which has become vitiated can be renewed with a supply of pure fresh air without the creation of a draught injurious to health? To do this the air must enter copiously, but almost imperceptibly, and when used, or become vitiated, its exit should be both continuous and complete. Ventilation is of two kinds, natural and artificial, the former being effected by means of windows and doors, with the crevices round them, as well as by chimneys and fireplaces, which are important agents in natural ventilation, and may also, by scientific arrangements, be made conducive to an efficient system of artificial ventilation peculiarly applicable to dwelling-houses.

* Read at the Royal Institute of British Architects by HENRY ROBERTS, F.S.A. Continued from page 50.

† The space allowed in the cells of prisons should not be regarded as an absolute criterion; at the Model Prison, Pentonville, there are about 800 cubic feet.

‡ The Report of the Government Commissioners on Warming and Ventilation says, at folio 99—"Under all the circumstances, we would urgently direct the attention of the Minister at War and the Horse Guards to the absolute necessity of providing more room and accommodation for the soldier in barracks; and that instead of 500 cubic feet of space, that 700 to 800 cubic feet should be allowed per man, or, as in the case of the Wellington Barracks, that only ten persons should occupy the space allotted to sixteen; and that these regulations should be enforced as soon as extra spaces can be provided throughout the whole of the United Kingdom." In a previous part of the report, at folio 92, are found the following apposite remarks, which scarcely appear to have emanated from the same mind—"The continuous removal of impure air as it arises is of very much greater importance than the cubical contents of air in a room. In the soldiers' rooms, which are constantly occupied, the amount of cubical space can be of very little importance, for how lofty soever the rooms may be unless the heated and impure air can pass away, the space will soon be occupied by air unfit for respiration, and the greater or the less size of the room will only resolve itself into a little more or a little less time before the air is brought into an impure condition." The soldiers' rooms are about 12 feet in height; with good ventilation, this might be reduced to 11 feet or even 10 feet without disadvantage.

§ In order that the amount of space now deemed requisite in hospitals may be readily compared with the above, I quote the following:—"In solid-built hospitals the progress of the cases will betray any curtailment of space much below 1,500 cubic feet. In Paris 1,700, and in London 2,000, and even 2,500 cubic feet, are now thought advisable."—Miss Nightingale's "Notes on the Sanitary Condition of Hospitals."

In new buildings improvements may be easily adopted which are not always applicable to old buildings; but, as far as circumstances allow, they should be carried out, from a settled conviction that pure air is indispensable to a healthy state both of body and mind.

Windows properly constructed, made to open at the top as well as below, and suitably placed, afford the most ready means for the natural ventilation of dwellings, besides which are the various contrivances of *louvre*s of perforated glass, zinc, tin, &c.

Chimneys act as ventilators whenever a fire is lighted in a room: the lower stratum of air being immediately set in movement, a current of air is established from the crevices round the doors and windows, or from any other openings towards the chimney, whereby much of the vitiated air is carried off. This process of ventilation takes place in a slight degree when there is no fire in the chimney, and, therefore, bed-rooms are much more healthy with a chimney than without. It should not, however, be forgotten that a large portion of the vitiated air ascends above the chimney opening, and therefore it is essential that a provision be made for its removal thence whenever perfect ventilation is desired.

An independent supply of fresh air may be introduced into most rooms which have a fireplace, by conveying it through a pipe or channel formed under the floor or in the wall to an air-chamber constructed at the back or sides of the stove, in order that it should be there warmed before entering the room. I have seen in Edinburgh a solid fire-clay bed-room chimney-piece and grate formed so as to leave when it is set a cavity round it, which appears well adapted for this purpose. The same or a separate pipe or channel may also be used for feeding the fire with air, independent of that in the room, for this purpose it should pass out at the checks of the stove, rather than beneath the grate, which is liable to cause a diffusion of dust in the room. Such a supply of air tends to render chimney ventilating valves more certain in their action than they often are, owing generally to an insufficient draught in the chimney, which causes the emission of smoke into the room. These valves would be invaluable for the discharge of vitiated air, which is their intended purpose, were it not for this occasional ingress of smoke. The most effective means of avoiding that evil is the carrying up an independent flue in close contact with a smoke flue, constantly in use, as that from the kitchen, the air within the ventilating flue is by this means rarefied, and the action of the valve rendered more efficient. Tubular flues, of pottery, made double for this express purpose, are found to answer well, and have the advantage of occupying but little space, whilst they are not liable to the objection pointed out to me many years since by an eminent builder, who had found that cast-iron flue linings, having no mortar joints, acted as a dead space in the wall. In cases where the chimney-valve being fixed in the flue, causes an ingress of smoke, the most effectual remedy is, I believe, Dr. Arnott's smokeless grate, with the draught duly regulated by a contraction of the vacant space over the fire. These grates economise fuel considerably.

Ordinary grates, I may here remark, are alike wasteful of heat and fuel, both of which would be much economised by the substitution of a stove projecting slightly into the room, and combining the chief advantages of the one known as Dr. Arnott's ventilating stove, with the cheerful open fireplace. I have seen some such stoves in use on the Continent, and I believe that the only valid reason against their adoption in England, beyond the force of custom, is the difficulty—not, however, an insurmountable one—of applying them to fireplaces with the ornamental chimney-pieces in such general use. One of the most useful modern improvements in grates is that of forming the back and linings with fire-brick instead of iron.

The intimate connexion between warming and ventilation has led to a digression, in returning from which I remark that, in order to render natural ventilation effectual, the openings required for the escape of vitiated air should be placed either in the ceiling or near to it.* How far the admission of fresh air also in the upper part of the room be objectionable, on the ground that the air vitiated by breathing, which ascends in consequence of its relative lightness, is in that case only diluted, and not entirely replaced by pure air, remains, I believe, yet to be determined by properly conducted experiments.

With all the various contrivances and arrangements proposed for the admission of fresh, and the exit of vitiated air, unaided by those appliances which are scarcely consistent with the term natural ventilation, none have come under my observation which secure uniform action, and fully guarantee that the distinct provision made for the exit of vitiated air shall not become the medium for the ingress of cold air, on a change of temperature in the apartment, the frequent consequence of which is a draught more or less perceptible. In order to avoid this evil, various means have been adopted, according to circumstances, with varying success. The use made of chimney-shafts for this purpose has been already noticed. Tubes or shafts, of wood, of clay, or of metal, are also available, provided a constant outward current is maintained by such an application of heat as will sufficiently rarefy the air. Hot water has been, and may often be applied externally for this purpose with advantage. I have used gas enclosed within an upright shaft partly of wood, the light being placed behind a square of glass, and the air entering through perforated zinc, with a hopper enclosure; by these means the combined benefit of light and ventilation are obtained from the same quarter. In many situations this simple plan might be easily adopted, and in dwelling-houses generally I believe that gas might frequently be rendered a valuable contribution to ventilation, instead of being injurious to health. As a sunlight, with a double tube, it has been so employed with success.

The utilisation of heat from stove fires, from hot water, or from gas in ordinary use about a house, is apparently so natural and easy a means of obtaining a motive power to assist in the ventilation of dwelling-houses, that I have noticed them under the head of *natural*, rather than of *artificial* ventilation, to which I must now refer.

Artificial ventilation is ordinarily effected by the action of valves, fans, pumps, screws, furnaces, stoves, or other artificial heat, and a variety of contrivances, whereby air is either drawn out or forced into an apartment.

In the one case, the space occupied by the vitiated air, which is withdrawn, is replaced by an admission of pure fresh air; and in the other the pure air forced into the apartment causes a displacement of the vitiated air, for the escape of which due provision must be made. In both cases a just proportion between the volume of air which ought to enter and that which should be expelled is necessary; and in order that the fresh air may be adapted for use at all seasons of the year, means must be provided for warming it prior to its distribution in the apartment. The best means for effecting this is, I believe, by bringing it in contact with heated fire-brick, suitably arranged in stoves or furnaces. When heated iron is used for this purpose the air is liable to be deteriorated, or, as is commonly said, burnt. Hot water, which is similarly employed, has not this injurious effect.

Nothing can be more inconsistent with a healthy system of warming than those arrangements which provide only for raising the temperature of the air already in the apartment, vitiated as it may be. Such is mostly the case when the German hot-air stove is used, and also when hot water is circulated in pipes through the apartments; but either may be employed with impunity as an auxiliary to an open fire.

Whether suction or propulsion be preferable as a motive power, for effecting the change of air in ventilation, is a question which has been much discussed here, as well as in Paris and Brussels. After examining both systems in their practical application, the latter appears to me decidedly preferable, excepting in peculiar cases, when the power of suction may be more readily applied.

When fresh air is forced into an apartment, through suitably placed openings, it becomes more generally diffused than it does when its entrance is dependent on the withdrawal of the vitiated air by means of suction, the tendency of which is to draw the fresh air towards the point of exit, instead of leaving it to disperse and circulate freely. Suction involves the further disadvantage of setting in movement whatever noxious vapours may be within its reach.

Whilst artificial ventilation is mainly applicable to public buildings, to manufactories, and to dwelling-houses of considerable magnitude, its principles may often be adopted in numerous instances occurring in an architect's practice.

For this reason, as well as on account of the great influence which ventilation exercises on health, more has been said on this branch of my subject than some may consider necessary. I cannot, however, quit it without expressing a regret that the science of ventilation* has not been more thoroughly mastered, and its practical application more simplified than it would seem to be from the Report of the Government Commissioners on Warming and Ventilation, known doubtless to many of you, and which, with its mass of practical information appears to me to have failed in placing the subject in that clear light which was contemplated on the suggestions made by Dr. N. Arnott, in 1849, for an investigation by "a committee of eminent scientific men, comprising chemists, engineers, and physicians."

3. Having considered those circumstances in regard to a healthy dwelling which appertain to the locality, and those which are structural, it remains for me to notice very briefly "those which depend mainly, though not wholly, on the occupants themselves—external and internal cleanliness, and a proper use of structural arrangements."

The most suitable provision for rendering a dwelling dry, or for its efficient ventilation, will not secure the health of the occupants, if there be either around or within the abode an accumulation of dirt, whether in a solid or in a liquid state. Houses may, to all appearance, be very desirable dwellings, but if the drainage be out of order, or there are cesspools within their precincts, or untrapped and foul sinks, there is no safety for the inmates. Nor can the close proximity of stables be a matter of such indifference as might be supposed from the practice so prevalent in the most wealthy parts of the metropolis; for one inevitable consequence is that, in the summer, many windows which should be opened for ventilation remain closed, in order to exclude the noxious fumes of the dung-heaps.

Neglect of sanitary laws is as much manifested in the country as it is in towns, and on the Continent not less than it is in England. It would be easy to point to spots where the air is unrivalled for purity, and the scenery around of surpassing beauty; and yet such are the accumulations about the dwellings, that it is often difficult to enter the doors without wading through a stream of filth, alike offensive to the sight and to the smell. Can it be a matter of surprise if such violations of the known laws by which God regulates the health of his creatures, be visited with sickness and premature death? With equal certainty as to the issue, we may predict that those who live in close proximity to black and stagnant pools, to foul ditches, or to sluggish open drains will periodically suffer from fever or dysentery, as we do that the house in flames will be consumed if the destructive element be not extinguished, or that the neglected garden will be overrun with weeds and become a wilderness.

Internal cleanliness in the houses of the wealthy, and all that as matters of daily routine are connected therewith, including proper attention to the sinks and traps, as well as the ventilation generally, is, in the main, left to the care of servants;† and often through their ignorance, rather than their culpable neglect, the health of the family, and especially that of the younger children, is very seriously injured, without the slightest apprehension as to the cause. Many instances might be cited in proof of a fact which is calculated to arouse even the most self-indulgent, and to induce them to co-operate in such a diffusion of sanitary knowledge as will alone insure, that which is dependent on the occupants themselves, a proper use of the structural arrangements essential to a healthy dwelling. The middle classes would contribute less grudgingly than they now often do, towards the cost of public sanitary improvements, and would even urge their extension, if they were better acquainted with the laws of health, whilst a practical knowledge of such of them as relate to in-door life—whether it be that of the dwelling house, the manufactory or the workshop—would lead them duly to appreciate the advantages of cleanliness and good ventilation, and to see that their benefits were extended more generally to those bives of human industry where numbers of working people congregate for many successive hours, partly by gas.

If the want of knowledge and forethought debar many in the upper and middle walks of life the full enjoyment of a healthy dwelling, how much more is it the

* In a certain description of common rooms, ventilation may be effected by means of wooden tubes perforated with holes, or having chinks at the angles; in some cases they may be carried across the ceilings, and in others be fixed at the angles. They have also been used for admitting fresh as well as for the exit of vitiated air. These tubes distribute the air more generally, and are not so likely to be closed as either Sherringham or Hart's Ventilators, both of which are very useful in many situations. A cheap cottage ventilator may be made with a triangular piece of zinc, fixed in an upper angle of a window, and perforated in the centre with a projecting rim formed round the perforated part, in order to receive a moveable cover, which may be hinged.

* A simple test, whereby the deterioration of the air could be readily ascertained, is a great desideratum.

† The recent publication in a cheap form of Miss Nightingale's highly practical Notes on Nursing affords the means of conveying many valuable lessons on this subject to domestic servants. I have endeavoured to give some practical instruction in a lecture, entitled "Home Reform; or, what the Working Classes may do to Improve their own Dwellings."

case in regard to the laboring population, most of whom are under the further disadvantage of having scarcely any choice as to the external circumstances of their dwellings, and often but little as to the internal accommodation. The difficulties arising therefrom with which working people have to contend, in most thickly populated towns, are well known to be very great. I shall not dwell upon them here, nor attempt to point out the degree in which they are increased by habits of intemperance—the most fruitful cause as well as consequence of domiciliary wretchedness. Such a calculation as would show the probable amount expended by the working population in the metropolis and its suburbs in the 10,200 houses open for the retail sale of intoxicating liquors would be instructive, both as to one fruitful cause of the evil, and also as to legislative measures of an indirect character needed for its removal.*

SOCIETY OF ARTS.

A MEETING of this body was held at the Society's house, Adelphi, on Wednesday, 22nd of January, when a paper was read by Mr. M. DIGBY WYATT "On the Present Aspect of the Fine and Decorative Arts in Italy, with especial reference to the recent Exhibition in Florence." A portion of Mr. Wyatt's paper appeared in our last Number, and a continuation of it will be found in another portion of to-day's paper. The chair was occupied by Mr. A. HENRY LAYARD, M.P.

The discussion was commenced by Mr. JOHN BELL, who remarked that he had not had the advantage of seeing the Exhibition at Florence, but he regretted that the less after having heard so excellent an account of it as was given in the paper which had just been read. The paper was excellent in a great many points, with some of which he was not acquainted; but there was one with which he was well acquainted, namely, that of sculpture. There seemed to be no part of the Florence Exhibition to which Mr. Wyatt had paid more attention than that of sculpture, and that was natural, because sculpture was the growth of Italy; and he thought it might be said that art grew where the materials to work upon existed. Greece and Rome had beautiful marble, and the art of sculpture consequently grew there. In this country we had to import our marble, and that might be disadvantageous to the sculptors of this country, and be one of the reasons why we had not made so much progress in the art of sculpture as the Italians had done. He hoped Mr. Digby Wyatt would be able to tell them that the pieces of sculpture of which he had spoken in such admirable terms would be likely to form a portion of the Great Exhibition of 1862. Mr. Wyatt had also spoken of emulation, which no doubt did great good, and he hoped those works of art which had been referred to would, when they came to this country, lead to emulation, and induce sculptors to endeavour at least to equal, if not to excel them. Mr. Wyatt had referred to one piece of sculpture in high terms of commendation, owing to its simplicity and close adherence to nature—he meant the "Girl Reading." He (Mr. Bell) hoped that would come to England, because there happened to be a work of art by one of our own artists, also a "Girl Reading," to which he believed the expressions of eulogium used by Mr. Wyatt might be fairly applied. He referred to the beautiful "Girl Reading" by Mr. Dowell, one of the most beautiful works of art ever produced in this country. He had no doubt Mr. Dowell's work would form a portion of the Great Exhibition of 1862, and would be compared with the other from Italy. He was very much delighted with what Mr. Wyatt had brought under their notice in his paper.

Mr. OWEN JONES, having been called upon by the Chairman, said Mr. Wyatt had gone over such an extended subject that he was unprepared to follow him. He might remark, however, that it had given him very great pleasure to listen to the very excellent discourse of Mr. Wyatt, and to the views which he had endeavoured to inculcate, which, he was sure, must have much impressed the meeting. He quite agreed with Mr. Wyatt that the great distinctive feature found in the Italian character was an innate love of art, which pervaded all classes, and which we as a nation so much wanted. But at the present time, as Mr. Wyatt had stated, there had arisen among us a much higher feeling for art. And with previous Exhibitions, and the forthcoming Exhibition, which they were looking forward to with pleasurable anticipations, he had no doubt the English mind would be stirred up to enter into that peaceful rivalry which all nations were going into in the study of the beautiful.

Mr. WINKWORTH observed that he had made inquiries as to the probabilities of the best specimens of sculpture shown at the late Florence Exhibition being sent to the Great Exhibition of 1862. He had the pleasure of being acquainted with a gentleman who was employed in arranging that department of the Florence Exhibition, Signor Sebastiani Penzi, and he told him (Mr. Winkworth) that he thought he might speak with safety, knowing as he did the various artists who had contributed to the collection, and said he had every reason to believe that almost every piece of merit, and of course including those to which Mr. Wyatt had so ably, critically, and in such an interesting manner, referred in his paper, would find a position in the Great Exhibition of 1862. He felt exceedingly obliged to Mr. Wyatt for the way in which he had brought before the meeting so interesting a subject as the present position of the fine arts in Italy, where they might be looked upon as almost indigenous.

Mr. BISHOP said Mr. Bell had said that a particular art grew where the materials for it were found. He thought the artists of this country must not screen themselves for not being first-rate artists under the plea that the materials were not produced in this country. The remarks of Mr. Bell would equally apply to the material of iron, which was produced to a greater extent in this country than in any other in the world, and yet we were in no way celebrated for great artistic works in that metal. In Seville he had seen ironwork in the form of gates, &c., which he had never seen equalled in this country. He had been asked, when in Florence, how he liked that city, and his reply was, that he had never been in any place where there was so much artistic design, even in simple things, such as a fountain, which was made into a beautiful design. In his turn he asked his interrogator how he liked London, and the reply was, "Your art is all right angles; even your lamp-posts are right-angled triangles." That was the general impression abroad with regard to art in this country. Artists when they came here soon lost taste, from seeing so much of right angles. In Italy there was some kind of design even in a lamp-post. He met with an Italian at Pisa, who told him that after having been five years in England as a designer of shawl patterns, he felt himself incompetent to his task, because he saw nothing around him to aid him in it. He thought much practical good would be effected by the exhibition of good photographs of the great works of art dwelt on in the paper, and a very great purpose would be answered if they were placed so that our artists and workmen could have the opportunity of inspecting them.

Mr. WINKWORTH said as an effort was being now made to give encouragement to the production of mosaics in this country, he begged to ask Mr. Digby Wyatt, who had alluded to mosaic art, and to various decorative specimens which appeared at the Florence Exhibition, whether he had had any opportunity of ascertaining the relative expense of producing mosaics at the present time as compared with ancient times; and also what he thought would be the expense in England as compared with Italy, ancient or modern.

Mr. DIGBY WYATT replied that he had made inquiries on this subject, but it seemed impossible to ascertain what was the cost of a particular piece of mosaic, because there were only three great establishments in Italy where it was made, and they were the only establishments that he was aware of at which mosaics for monumental purposes were made. These establishments were kept up on vested funds, so that it was almost impossible to ascertain what was the cost of any particular piece of work. From inquiries he had made he found the cost varied very much. In Rome, where the work was very fine, he had heard that the cost was as much as £12 per foot. In Venice it was from £4 to £5 per foot. He thought it would be difficult to get such work done in England for less than £4 or £5 per foot. He had very little doubt, when the first difficulty was got over, the price would not vary more than from £4 to £5 per foot, and in a few years' time they might consider that would be about the price.

Mr. WM. HAWES remarked Mr. Digby Wyatt had very truly said that the great benefit to be derived by the working classes from the forthcoming Exhibition was from the opportunity that would be afforded them of inspecting the superior works

of others executed both at home and abroad. The apprentice was apt to look up to his master as the workman to be followed, and it was only by that class looking at superior works that they could be induced to emulate them. It would be impossible to describe the benefits which the working classes would derive from this opportunity of comparison in language more powerful or more beautiful than that which had been used by Mr. Digby Wyatt; but it would be impossible to do good in this way if the price of admission to the Exhibition of 1862 was to be maintained at what it was in 1851. The working classes never went by themselves to such places, and if the charge for admission was so high as to preclude the working man from taking his wife and family with him, he practically was excluded from the great educational advantages that would be derived from the inspection of the productions of rivals in their crafts in other countries. Mr. Wyatt had noticed the growing love of true art in this country—especially amongst those who from their position and means were able to encourage it; but might they not fairly ask whether a great deal of the want of love of art which had hitherto characterised this country was not owing to the absence of proper teachers of art? Had their architects that love of art which characterised the whole of the paper they had just heard read? Had they advocated and practised that freedom of thought and design, that love of comparison with the works of foreign countries, without which no progress could be made? He thought the luxury of art had not been known amongst them; and it was only when such men as Mr. Digby Wyatt compared the works of foreign countries with those of their own country, and told them in what respects they were superior to ours, that we should become as fond of art, and as ready to encourage it in England as they were in Italy.

The CHAIRMAN said he entirely agreed with what Mr. Wyatt had said with regard to the strong feeling for what we called art which had always prevailed in Italy. Mr. Wyatt had spoken of the industrial arts as being the handmaids of the fine arts. He (the Chairman) was afraid that those parties had once appeared before Sir Cresswell Cresswell, and had been divorced in this country, inasmuch as for a long time past there had seemed to be a complete division between them. Even as late as a few years ago, Englishmen imagined it to be some reflection upon the national character if they united the beautiful with the substantial. Things English were generally things substantially ugly. They might be useful and durable, but beauty was the last element considered. The Italians, from the earliest period of their history, were imbued with the consideration that the elements of beauty were essential in all things which served the uses of daily life. Their simplest boxes, their keys, their handbills, their knives, weapons, and armor—everything which they were in the habit of using—were beautiful. Mr. Wyatt had described how the old Italian writers had pointed out the different masters who were to be employed not only in the decorations of a palace or a church, but in some of the most subordinate details. He might have furnished several illustrations of the carrying out of such advice. Take, for instance, the Palace of Urbino, built by Frederick, Count of Montefeltro, afterwards Duke of Urbino. This prince of a small Italian province sent for artists of the highest standing in all Italy, not only painters and sculptors, but workmen in mosaic, in pottery, and in metals. Their names had been preserved. Melozzo da Forlì—of whose works but fragments remained, yet sufficient to prove that he was one of the greatest painters of his time—Pietro della Francesca, and others, were employed in the walls of the principal apartments, not in painting Madonnas and drunken bores, as Mr. Wyatt had remarked, to be hung up promiscuously in drawing-rooms and dining-rooms, but in decorative painting, with a meaning and an object. For instance, in the library, Melozzo and others painted the poets, philosophers, historians, and orators of ancient times. As illustrating a strong difference of taste, he might mention that when he saw the palace, four years ago, the Papal Legate who inhabited it had sent for an upholsterer, and caused the walls to be papered, and the sculptured chimney-pieces and doors to be removed, for the sake, as was alleged, of rendering the apartments more habitable. This repugnance to decoration was with us almost a national characteristic. After the capture of Delhi, during the Indian mutiny, the beautiful palaces of the Mogul Emperors were occupied by our troops. One of the rooms in which an officer had quartered himself had walls of the most delicate alabaster, inlaid with mosaic work of agate and other precious stones. This was not apparently consistent with his comfort, or his notions of a suitable dwelling-room for an Englishman, and he had the walls whitewashed, but still the gems might be seen glittering through this unworthy covering. They found the greatest masters of Italy devoting their intellects to what might appear, to the modern artist, trivial and unworthy things. Raffaele did not disdain to employ his genius in bringing to perfection that school of arabesques which was founded by Benozzo Gozzoli, Perugino, and Pinturicchio. He spoke under correction, but it would probably be admitted that the most perfect specimens of decorative art, combining what we call high art with the most minute detail of decoration, was the well-known Piccolomini library in the Duomo of Siena. Here splendid historical frescoes were united with the most exquisite arabesques in architectural ornamentation, majolica pavement and carved woodwork—forming one well-considered whole; it was the unity, the carrying out the one great idea throughout, which gave the charm to, and constituted the great beauty of, this magnificent chamber. What would have been the result, if, as probably would have been the case in England, whilst the walls were painted in frescoes the ceiling had been simply whitewashed, the dado of common painted wood, and the flooring of deal boards? That was what would probably have been done in this country a few years ago, if not at this day. He believed the South Kensington Museum, as it was called, had done much in teaching us what art really was as applied to the enjoyments and to the necessities of life, and in awakening an interest in this kind of art. Those who had brought that important collection to its present condition were deserving the highest credit. People looked upon South Kensington as a museum, he did not. [They had the British Museum for the reception of works of art and of antiquity, of all times and classes, illustrative of the progress of civilisation, and consequently of the history of man; but Kensington Museum should contain such objects alone as would furnish instruction to, and cultivate the taste of, not only the working-man, the manufacturer, and the artist, but also those who had the desire, as well as the means, in their own dwellings and by their example, of promoting the public taste. A monument was to be raised to the memory of that illustrious Prince whose loss the whole nation deplored, and none more than those who were connected, like the present audience, with societies for the encouragement of arts and sciences. His own feeling was that the Kensington Museum offered an opportunity of raising a worthy and suitable monument to Prince Albert, for it was mainly to him that the country owed that important national institution. He would like to see that museum converted from an incongruous collection of exhibition rooms, without architectural symmetry or design, into a really handsome public building, worthy of the metropolis and of the magnificent collection thus brought together, and dedicated to the memory of the late Prince Consort. He believed that such a building and institution would be not only a worthy but a lasting monument to his name. It must be acknowledged that we were still very far behind in decorative art in this country. Mr. Owen Jones and Mr. Digby Wyatt had done much, by their important and valuable works, to improve it, but it was too much looked upon as coming within the tradesman's province. The works of these gentlemen were too frequently used like tailors' pattern-books—a frieze applied now, and an ornamental border then, without any reference to object or site. That was not the way in which decorative art was understood and carried out in Italian history by the great artists of the time; and, indeed, as Mr. Wyatt had pointed out, we had still in Italy the strongest indices of the artistic taste and of the love of the beautiful in the simplest details, which prevailed amongst all classes in that country, even in the present day. There was nothing which struck him more in Italy than the number of artists, or skilled mechanics, to be found in the small towns. He believed that was in a measure owing to the municipal system which once prevailed, and which was still far from extinct in many parts of Italy. Cordially as he rejoiced in the prospect that was opening for Italy of a great and prosperous national unity, he nevertheless hoped that the municipal spirit would never be destroyed, but would, on the contrary, be developed to the full extent. He believed it to be the best guardian of liberty and the best promoter of civilisation. During the middle ages each city rivalled its neighbour in the arts. Traces were still to be found of this rivalry in the artists, almost unknown, who long preserved the art traditions of their native places, and who, in any other country, would have established their fame. At Siena, Giotto (whose work had been mentioned by Mr. D. Wyatt), was no unworthy representative of the great school of wood carvers of which the Barlilis were the heads. He (the Chairman) had purchased the first tiles made by the young man at Siena, also mentioned

by Mr. Wyatt, then a chemist's apprentice, who succeeded in imitating, almost to deception, the beautiful majolica pavement from the Piccolomini Palace, now in the Kensington Museum. Napoleone Verga, of Perugia, another young artist mentioned by Mr. Wyatt, and described as not an unworthy rival of the great Italian illuminator of the middle ages, had sent him (the Chairman) last year a collection of miniatures of singular beauty for sale, for which he had, he regretted to say, not been able to find a purchaser, even at the small price of four Napoleons a-piece. One of the ablest workers in intarsia he had ever known (an art which once had attained the greatest perfection in Perugia) was killed in the capture of that city by the Papal troops; and Benvenuti, the wood carver, still sustained the reputation of the school of wood carving which once flourished in Perugia. He need not mention to them the name of Castellani, the celebrated jeweller of Rome, who was perhaps better known to English travellers than any other Italian artist-workman. However deficient may have been the collection he exhibited at Florence, he (the Chairman) could state that he had promised to send a complete series of his truly exquisite jewellery to the Great Exhibition. Mr. Digby Wyatt had alluded to the circumstance of architecture not having kept pace with the other arts in Italy, but the fact was that, owing chiefly to political reasons, there had never been a demand for architectural display. The Jesuits destroyed that art in a great measure; there were few churches built by them, and they were the great church builders of Italy of the last three centuries, which were not of the most debased style. It was almost incredible that a people with the taste and feeling for beauty of the Italians should have permitted their churches to be disfigured with the tawdry decorations and the hideous figures of wood and wax which marked a fast day. He would not inquire the reason why this was so—it might raise questions to be avoided in such a meeting. Those who had seen the restoration of St. Maria Novella at Florence, of the Minerva at Rome, and of St. Petronio at Bologna, would form some idea of the degraded state of church architecture in Italy. He must, however, note one remarkable exception, the facade of the church at Santa Croce, at Florence, mentioned by Mr. Wyatt. He alluded to it more particularly, not only because it was a work of singular beauty, but because he thought Mr. Wyatt was in some respects mistaken as to the way in which the work had been carried out. The architect, Cavaliere Nicolo Matas, had endeavoured to rebuild the facade in conformity with what was believed to be the design of the original architect, who had left it unfinished, and to connect it with the sides of the edifice which had been completed. Signor Matas had employed for the purpose only white, green, and dark red marbles, the three used in the finished part of the building. He had succeeded, in his (the Chairman's) judgment, in producing an admirable imitation of the old style; but the way in which the work had been performed was highly interesting, and appeared to him (the Chairman) to be the right way in carrying out a really great enterprise of the kind. Mr. Digby Wyatt had told them that the greatest artists in Florence had been employed.

Mr. DIGBY WYATT—I meant for the sculpture.

The CHAIRMAN believed his friend had been misinformed. In a conversation with the Cavaliere Matas, he learnt that, so far from employing well-known artists, he afforded the opportunity for any young men to carve the sculptured heads and ornaments which adorned the doorways, &c. Those who then undertook the work did so partly from religious and partly from patriotic motives, and it was on the understanding that they were to be paid only sufficient pay for the actual labor to maintain them, and that they were not to be paid for what might be termed the artistic skill they might display. These sculptures had thus been produced by young artists at the mere price of their day's labor, and a school of architectural sculptors was thus being formed. That the work could not have been executed to any great extent by first-rate artists was, he thought, proved by the fact that, up to last year, the whole sum expended did not exceed £10,000, of which nearly £8,000 had, he believed, been contributed most magnificently by his friend and countryman, Mr. Sloane. He believed there was a great career open for Italy. He trusted the Italians might go back, as regarded the decorative and other arts, to the position in which they were in the fifteenth century, before the bright, clear stream of Italian civilisation had been polluted by the barbarian torrents which poured down the slopes of the Alps, and by the false taste which followed, to hollow imitations of the Classic schools. It was impossible to say to what perfection such men as Giotto, Orcagna, their contemporaries of the fourteenth century, and the great masters of the fifteenth century, might have carried architecture if they had been allowed to perfect the styles which they introduced. Mr. Wyatt had alluded to the language of Italy, and had justly condemned its present weakness and effeminacy. There could be no doubt that a strong, nervous, as well as polished language afforded evidence of the condition of a people as regarded their liberty and civilisation. He thought that already a great improvement had taken place in the language of Italy which augured well for the future. He believed that when statesmen had been trained to the habit of public speaking by free debate in a free popular assembly, as they would ere long be, the Italian language, a language of the highest capabilities, would not be unworthy of a great, free, and highly civilized people. In conclusion, the Chairman tendered the best thanks of the meeting to Mr. Wyatt for his very interesting and instructive paper.

Mr. DIGBY WYATT, in returning thanks, said he had not gone into the details of the work of the restoration of the church of Santa Croce, but he had had frequent conversations with the Cavaliere Matas, and had inspected the building with minuteness. The Chairman was correct in saying that a great deal of the work was done by young men and boys, educated as his friend Mr. Owen Jones educated young persons to carve at the Egyptian intaglios of the Crystal Palace. But in addition to those decorative works there were large pieces of sculpture over the doors, bas-reliefs, 10 feet by 12 feet, which had been entrusted to the first sculptors of Florence. The great figures which stood upon brackets had also been given to the best artists of that city. So that whilst he repeated the best talent had been employed upon the most difficult portions of the work, he did not mean to say there had not been great efforts made to encourage the minor class of art talent on the less elaborate portions.

VOLUNTEER DRILL SHED AT BIRKENHEAD.

A NEW drill shed for the 1st Cheshire Volunteer Engineers has been erected in Church-street, Birkenhead. It is said that it will hold 5,000 persons. The roof is constructed of circular ribs in three thicknesses, of 3-inch spruce boarding, breaking joint. These ribs are placed 10 feet from centre to centre, with purlins 6 feet apart running longitudinally, with spars 2 feet 6 inches from centre to centre, nailed to ridge piece and wall plates. The whole framing is further stiffened with diagonal bracing, and the whole is boarded with 1-inch spruce boarding, covered with asphalted cloth. There are eighteen lights in the roof, filled in with rough plate glass, 6 feet 6 inches by 2 feet 6 inches, with gable lights 10 feet by 9 feet. The entrance to the building is from Church-street, opposite Messrs. Laird's iron ship building yard. Another entrance is obtained from Priory-street. The length of the building is 200 feet, the breadth 52 feet, and height 28 feet 6 inches. When lighted up, upwards of 200 gas jets throw a strong and effective light throughout. An orchestra capable of accommodating 150 performers has been erected. The cost of the shed will be about £500. The house in front will be appropriated for store-rooms, an armoury, and class-rooms. The building was erected from the designs of Lieutenant James Fisher, of the corps.

CHRIST'S CHURCH SCHOOLS, WEST BROMWICH, COMPETITION.

WE learn that nineteen architects sent designs for these schools, and that a Mr. John Weller, of Wolverhampton, is the successful competitor. The selected design contains three school-rooms, one for 150 boys, one for 150 girls, and one for 150 infants. Class-rooms are provided for each school-room. There is also a residence for the schoolmaster.

THE THAMES EMBANKMENT COMMISSION. SOUTHERN SIDE.

AT the last meeting of the Commission, it appeared that about twenty plans for improving the Surrey, or southern, side of the river and its navigation, as well as for establishing a public thoroughfare without stopping the trade upon the bank, have been sent in to the Commissioners, who will proceed to investigate their merits and report thereon to Parliament, on its reassembling, in order that both sides of the river may be embanked or improved contemporaneously.

Mr. HAWKESLEY was the first witness examined. He deposed that his attention had been directed professionally for the last 20 years to the subject of the embankment of the Thames, and that he had recently, at the special request of the local authorities on the Surrey side, gone into that part of the question. Referring to what he termed the "training" of the river, he would propose that its present irregular channel should be converted, by means of an embankment, both on the north and on the south, into one uniform width of 750 feet. This would amazingly improve the current, the navigation, and the general regime of the river. At present there was a large extent of unnecessary foreshore, and when the river became thus contracted, there would always be 5 feet depth of water for would be better to have a solid embankment, without docks, and he would clear the river of its floating barges and timber rafts, which should be stacked. There should be a roadway in front for the wharves, and as a promenade for the public, together with railways or tramways to take the coals and goods out of the vessels over the road by hydraulic cranes, into the warehouses. The whole of the Lambeth district was formerly a large lagoon, communicating with the Thames, and was from 6 to 8 feet below the highest tides, and hence the overflows, which the people had to keep out with cellar-boards. About two-thirds of all the existing wharf walls were bad and imperfect. As regards contributing to the cost of an embankment, the inhabitants contended that they did that already by paying the thirteen-penny rate on coal, and the rates levied by the Metropolitan Board of Works, which should go in aid of the embankment.

Mr. CHURCHMAN gave evidence generally in favor of an embankment, and submitted two plans for the purpose, one for an embankment and another for improving the existing water-way and river walls.

The LORD MAYOR observed it was not a very easy thing to see a way to a solution of the difficulties with which this question of embanking the Surrey side of the river was surrounded, and he was apprehensive that in many cases they would be compelled to leave the wharf walls where they were. The inhabitants on the Surrey side said their walls were so low that the water came over them, and were so defective that it percolated through them, and the only remedy was that they were bound to raise and repair them. The inhabitants on the Surrey side said they had as much right to have an embankment as the inhabitants of the north side; but the answer to that was that the Commissioners in laying down their plan for the Middlesex and northern sides had not done it so much in conformity with the wishes of the inhabitants, as they had recommended it rather in spite of them. They had said in many cases they were sorry this did not suit them, but it must nevertheless be done to meet the imperative necessities of the case involved in the public accommodation, and the requirements of the enormous traffic, between the City and West-end and other metropolitan districts, but there was nothing of this sort on the Surrey side carried on the edge of the river, as upon the northern edge, and the requirement might be met by the formation of new thoroughfares. The Commissioners had received a memorial from the numerous owners and occupiers of wharves on the Surrey side, representing that serious damage would arise to their respective trades by any impediment to the landing and loading of some million of tons of goods at their wharves, and suggesting that the evils arising from the floods may be altered by raising the banks and the wharf walls, and it had also been given in evidence that the sanitary state of the river would be greatly improved and the mud-banks and effluvia removed on the completion of the main drainage. If asked whether he would prefer seeing an embellished embankment, such as the late Sir C. Barry designed, he should certainly say so; but the question was, was it practicable, and whether they could accommodate the number of businesses, such as Mandley's and others, to whom, if sent away, compensation would have to be given. On the northern side it was different. There, there was a large amount of vacant space to be reclaimed, and they could afford to buy up or compensate; but on the Surrey side every yard was occupied. It might be desirable to embank the south side all the way along, and construct handsome quays and promenades, but it could not be done without an enormous amount of money, and the public had not got it to spend. The Commissioners had now received all the plans they intended to take, and would not recommend any without first of all fully consulting the interest of all the parties concerned.

The Commission then adjourned.

DECISIONS IN THE COURTS.

RAILWAY COMPENSATIONS.

Turnham v. the Metropolitan Railway Company.—An action brought against this Company, and in which the plaintiff claimed £1,000 damages, was tried at the Sheriff's Court, in Red Lion-square, before Mr. Serjeant Hayes, acting as assessor, and a special jury.

The plaintiff, Mr. Turnham, landlord of the Rising Sun public-house, in Euston-road, claimed compensation to the amount stated for an alleged injury to his house occasioned by the construction of the Company's works. The house, it appears, stands back from the line of street, with a court in front, separated by a wall from the forecourt of an adjoining house, occupied by a Mr. Morton. About six months ago a fire occurred at the Rising Sun, which rendered it necessary to rebuild a portion of the premises. Part of the new house rested on the wall separating the forecourts. Subsequently some fissures became apparent in the wall, attributable to the construction of the Company's works in close proximity, and it was pulled down and rebuilt. The claim for compensation also included an item for stoppage of trade, said to be due to consequent delay in rebuilding the public-house.

It was stated on the part of the Company that the wall was an old one, and, though they did not deny that the fissures in it might have resulted in a subsidence occasional to their works, they contended they were only liable to place the claimant in the same position he would have been if the railway had not been made—namely, to substantially repair the wall where injured—and not to be put to further expense. The Company, regarding the claim as exorbitant, tendered £25 under the Land Clauses Consolidation Act, determined to maintain what they conceived to be their rights.

The builder and architect employed by the claimant were the only witnesses examined.

The jury, after inspecting the premises, assessed the damages at £20.

SHORING UP PARTY WALLS.

Bulter v. Hunter.—This was an action brought, in the Court of Exchequer, by the plaintiff against the defendant, to recover damages for his not having shored up the house of the plaintiff. The cause was tried before Mr. Baron Martin, who directed a nonsuit. The Hon. George Denman afterwards obtained a rule to set aside the nonsuit, against which rule Mr. Huddleston, Q.C., now showed cause, Mr. Denman, Q.C., appearing in support of it.

It was proved at the trial that the plaintiff had carried on business as a baker for many years at 150, Tottenham-court-road. The defendant was the owner of the adjoining house (149), and in March, 1857, he was desirous of removing his shop-front. A brasseur or beam ran across the front of 149, and rested on the party-wall between that house and the plaintiff's. The defendant obtained an estimate from a builder, who agreed to do the necessary work. He took down the front of defendant's shop, but omitted to shore up the party-wall. Shortly afterwards the plaintiff's house showed signs of falling down, the walls cracked, and it was much injured. It was not denied that the injury sustained resulted from the not shoring-up of the wall, but it was contended that the builder was liable, and not the defendant.

The Court held that this was so, and discharged the rule.

CRICKET MALHERBIE CHURCH.

THIS little church, near Ilminster, Somerset, was rebuilt, a few years ago, to the memory of Stephen Pitt, Esq., by his widow, lately deceased. It is one of the smallest in the country, seats being provided for fifty persons only, and was erected from the designs of Mr. J. Mountford Allen, architect, of Crewkerne, at a cost of upwards of £3,000. The whole of the woodwork, including roofs, seating, &c., is of oak, which, together with the building stone, was furnished from the estate.

It consists of nave and chancel, north transept, comprising the manor pew, south porch, and tower at the north-west angle of the nave, containing a peal of five bells. The roofs are entirely covered with lead; the whole of the windows filled with stained glass, by O'Connor, and the floor laid with encaustic tiles by Minton and Co.

BIRKENHEAD CEMETERY COMPETITION.

THE designs sent in competition for the Birkenhead Cemetery Chapels Competition were publicly exhibited on the 23rd, 24th, and 25th instant. We understand that eleven architects sent designs. The Committee have selected a design, but the name of the successful competitor has not yet been made known.

Reviews.

The Builders' and Contractors' Price Book for 1862. Revised by GEORGE R. BURNELL. Lockwood and Co.

THIS book is now so well known that we need scarcely say more than to remind our readers that the consecutive numbering of the items, introduced as a means of immediate identification, has certain advantages which should not be overlooked. It is impossible to pronounce an opinion on the entire accuracy of the work, for such could be formed only after actual reference to it in practice for a longer period than that during which the present edition has been in our hands. It appears tolerably correct, however, with, perhaps, a slight leaning in favor of the builder.

The memoranda appended is well brought together, while good type, paper, and printing, go far towards divesting the price-book of its naturally uninteresting character.

The Engineers', Architects', and Contractors' Pocket Book for the Year 1862. Lockwood and Co.

THIS old established pocket-book, like the price-book noticed above, formerly issued by Mr. Weale, has, with it, been assigned to Messrs. Lockwood and Co. It contains its usual and large amount of useful information, which it is next to impossible always to bear in mind, and which is more or less always wanted. There are also papers on Sewers, Ironwork, Roofs, Artesian Wells, &c. A chapter on Iron Roofs gives figured sketches. The Obituary of Engineers and Architects for 1860-61 includes such names as John Wood, Laird, Vicat, Pasley, Hodgkinson, Hosking, Maudslay, Austin, Cubitt, and others.

Adcock's Engineers' Pocket Book for the Year 1862.

IS not intended solely for engineers; architects and contractors will here also find voluminous notes and data on subjects of every day practice. Fortunately, it does not seem at all necessary to express any preference for either one or the other of these books, for, whereas the matter given is in some cases the same, and necessarily so, their respective pages are for the most part characterized by just sufficient diversity to enable practitioners to select that which may be more especially suited to their ideas and wants, feeling confident, at the same time, that, whichever they may select, they will not be far wrong. In both we observe some trifling—perhaps, almost unavoidable—inaccuracies.

The Church Builder; a Quarterly Journal of Church Extension in England and Wales. Rivington.

THIS new quarterly periodical is issued by the Committee of the Incorporated Church Building Society, who feel that, in the present day, when so many charitable institutions are competing for support, and endeavoring to attract attention to their own special objects, it is indispensable to adopt every legitimate method of keeping any particular society before the public.

It seems to us that what is intended is to issue something like the usual quarterly reports of the society, in a revised form, at a charge of threepence.

The *Church Builder* will contain anecdotes connected with churches and church work, popular papers on architecture, notices of mortuary memorials, antiquities discovered in the course of church restorations, &c.

The Sheppy Almanac and Directory for 1862. Rigg, Sheerness.

APPEARS to be a very complete local directory. In an article on the sanitary history and condition of Sheerness. It is said that:—

At present, and from the earliest history of the town, the marshes on the south side, and which cover an area of about 1,700 acres, have been made the receptacles for the sewage. A series of ditches or intersecting water courses, covering an area of 74 acres, have been formed in all directions and run into them, carrying in their course a great proportion of the sewage of the town, as well as storm water, there to remain to emit health-destroying malaria on every hand, or to escape by absorption into the earth, or by evaporation into the air. The picture seems a black one, but it is by no means an exaggerated one. In fact, the town is mostly surrounded (except seaward) by stagnant and stinking ditches, the principal of which were primarily formed for the purpose of draining the town and the marshes themselves, but, for the want of a proper and efficient outlet, eventually serving as reservoirs and hot-beds for generating poisonous matter and producing disease and untimely deaths.

After much delay, however, drainage works are in progress.

The outlet for the drainage and the works connected therewith, are placed at West Minster. The waterworks, baths and wash-houses, will adjoin Trinity Church. The principal features in the former are that the sewage runs into a large reservoir, 46 feet in diameter by 12 feet deep, which, after being decolorised and clarified by passing through a filter-bed of gypsum and charcoal, runs into the river by gravitation at low water, and will be pumped out into the river at high water by a scoop-wheel and other machinery invented by Mr. Burns. The pumping machinery will consist of two duplicate steam-engines and two screw tangential pumps and one "bucket scoop-wheel." These machines will be capa-

ble of doing 95 per cent. of duty, while the ordinary pumps are only capable of doing 70 per cent., and the large scoop-wheels which are used throughout the fens do not do more than 50 per cent. duty. Mr. Burns' machinery, when at work at West Minster, will be capable of discharging 50 tons of sewage per minute. It is contemplated to work only one engine and scoop-wheel at once, the other engine and tangential pumps being simply kept as reserves in case of accident or repair. The pumps can also be used for irrigating the land in the vicinity if required.

The length of the sewers to be laid down is over nine miles, and the water-pipes nine miles. The waterworks consist of a well 210 feet by 6 feet 6 inches diameter, and a bore-pipe 14 inches diameter, 70 feet deep, down to the bottom of the well. The water is to be pumped from the well into the tank, 65 feet diameter by 16 feet deep, elevated on a brick tower 70 feet above the surface of the ground. Connected with the waterworks there will be four sets of hot and cold baths, a wash-house and drying stove, a board-room 30 feet by 27 feet, dwelling-house for manager and engine-man. The pumps are to be of a different construction to any in use in England. They are the invention of Mr. Burns, and are capable of working constantly without requiring to be repacked oftener than once a year, whereas the ordinary pumps require to be repacked about once a fortnight. The steam boilers are also different from the usual construction, are perfect smoke preventers, and are capable of evaporating 10 lbs. of water for each pound of coals consumed. The whole of the public works will be completed by the end of June next.

Sheerness is certainly behind the age in some matters; for instance—

The water supply is obtained from the dockyard well, and two wells in Mile Town; the water is doled out by means of donkey barrels—a primitive custom and curiosity of the place—at 1s. per load of six gallons, or, according to an estimate of the late Mr. Austin, Local Government C.E., at a cost to the inhabitants of at least £3,000 a year.

The Midland Counties Almanac and Rural Hand Book for 1862. Newcomb, High-street, Stamford.

THIS is an admirably got-up almanac and hand-book, and should find a large circulation in the district in which it is published, the farming, gardening, and domestic matter being at once useful and of unusual extent for a work of this class. The very necessary distinctions between the advertisement pages and the body of the work is well preserved.

S. O. Beeton's Publications.

JUDGING from a pile of periodicals before us Mr. Beeton is working in a useful direction, in supplying information on many subjects in a popular manner, and in providing amusement and instruction in a harmless way for the young. There is, firstly, the *Christmas Annual* (with its illuminated almanac), comprising a variety of matter, well written, and accompanied with many illustrations. Mr. William Brough's extravaganza for drawing-room performance will, we have no doubt, have been received with great favor. The simplicity of the costume required in its performance is a great merit. There is no doubt that it is a cheap shilling's worth. *The Englishwoman's Domestic Magazine* gives, in addition to its usual matter, a large sheet of patterns, which, we believe (not of our own knowledge) is worth more than the cost of the book, and some *cambric collars*, &c., quite ready, we suppose, to be worked and worn. *The Boy's Own Magazine* gives instructions, among other things, how to model a small working steam-engine, with wood-cuts showing the construction of the several parts. *Home Pets* continues to treat of the habits and treatment of birds. *The Boy's Own Library* is occupied with the adventures of "Phaulcon, or the Ship-boy who became a Prime Minister;" it is printed on better paper than we meet with sometimes now-a-days. Of the *Illuminated Family Bible* we have before given an opinion. *Beeton's Dictionary of Universal Information in Science, Art, and Literature*.—This is the first part of the second volume of the "Dictionary," which is intended to give to "the non-scientific and general reader a full and faithful account of the forces which animate nature, and which are incessantly acting upon mankind—of the elements of which all things are composed,—of inventions of every kind, and of every art and process to which the genius of man has given birth; in other words, here is presented an immense and interesting body of facts, in so far as they relate to things."

We must for the present content ourselves with expressing warm approbation of the *Book of Garden Management*.

GENERAL NEWS.

PATENT BRICKMAKING MACHINE.—The following is a description of an improved patent brickmaking machine, which fills successive groups of moulds with tempered clay, half dry; it compresses the clay into the moulds by a double eccentric; it shaves off the surplus clay, which is thrown back by the eccentric. The group of filled moulds is discharged by the machine, and inverted by hand in an instant; a spring receiver is run underneath, and the whole group of moulds is instantly delivered on to it by a quarter turn of a small piston. "By a calculation of the working power of the machine, and taking each group of moulds at thirty bricks, it is capable of moulding 350 bricks every minute, allowing the 4-horse power engine to make but forty revolutions per minute; 360 per minute are 21,600 per hour, or 216,000 in ten hours. The facility with which the bricks are taken away in groups, and stacked in stoves to be dried in eighteen hours by steam heat, or stacked in the open air to be dried in four days, without regard to weather, is equally to be admired, as the production of so large a number; for every single brick has its top, bottom, sides, and ends equally exposed to the heat. The mode of obtaining a full and constant supply of clay to keep the largest sized machine in constant work, and the mode of tempering that large supply preparatory to moulding, are not less ingenious and efficient than the construction of the machine itself. The machines can be made to produce any required daily quantity of bricks, from 20,000 to 300,000. The estimated expenses for cost of clay near London, grinding and tempering clay, moulding and drying bricks, fuel for burning, packing and discharging kilns or clamps, is 10s. per 1,000 best stock bricks. The patentee (Mr. W. Morris, C.E., of Lambeth-walk), states that he has experimentally tested all the parts of this small, though efficient, machine, and that £5,800 is quite sufficient capital to fit up and work one machine, capable of producing 200,000 bricks per day, ready for sale."

IRELAND.—LUNATIC ASYLUMS.—The Lords Justices have ordered that there be erected at or near Downpatrick, in the County of Down, in and for the proposed new District of Down, an asylum sufficient to contain and accommodate three hundred lunatic poor, such asylum to be called the Down District Lunatic Asylum. The Lords Justices have also, on the application of the Board of Governors, directed that a new Roman Catholic Chapel shall be erected in the Limerick District Lunatic Asylum, at an expense not exceeding £700.

Correspondence.

TO CHECK THE WARPING OF TIMBER.

SIR,—You lately published a few observations from the *Mechanic's Magazine*, which I do not think properly treats the subject. The observations made will apply to some classes of wood but not to all, and then only to timber that is grown in an open situation. The difference in the strength of timber between the south and the north side is attributable to the grain being closer on the north side, as the sap does not rise in the same proportion as upon the south. In forest-grown wood the difference is almost imperceptible, as the sun cannot act upon the trunk of the tree; in open-grown timber the difference is really perceptible, so that we must take open-grown wood to be the only wood that the article professes to deal with. It is well known that all woods do not lose strength by being open grown, or, in other words, that the south side is not always weaker than the north; that theory only applies to the coniferous species. In ash (*Flaxinus Excelsior*) it is the opposite, as the south side is the strongest. In soft-wooded trees, as the acer species, the difference is not perceptible, as the annular rings and the intervening cellular tissue are so close akin as to render the wood so compact in its grain that there is no difference in the strength. As I said before, the coniferous species, or the pines, are the only classes of woods that are stronger on the north side than on the south; it is well known that the difference originates in the wood being more open in its grain on the south side than the north.

There is a very decided distinction in the annular rings, which are of a yellow cast viewed on the end; the dark mark between is the cellular tissue, or the tender part of the wood, which in the heart-wood is filled in with a secretion of inorganic matter; in the sap-wood the cellular tissue is entirely open for the working of the sap, which renders it worthless for durability. It is evident that the closer the wood is grown the stronger it must be, as the cellular tissue is much thinner between the annular rings.

I think I have clearly explained the matter of the strength of timber between the north and south sides of the tree. And now to the cutting of it. The observations as to the cutting are entirely a fallacy. The warping of timber is attributable to the manner of its growth. Boards cut out of a tree that is twisted in its growth have another fault, in the heart of the tree not running straight like forest-grown wood. In a plank cut from a tree of this kind in a straight line, the heart will traverse it from one side to the other. No theory or treatment will prevent it from warping or drying hollow on the side furthest from the heart. When the heart is in the centre of a plank, and each side has an equal chance of drying, it will not warp, but there will be a shake or crack upon each side denoting the position of the heart. I must, in conclusion, observe that the wood of the north side will not warp so much as the wood from the south side; but the secret of preventing wood from warping is not to be arrived at by adopting the plan set forth. I contend that what would be suitable treatment for one tree would not apply to another. The nature of the tree, the soil upon which it is grown, the position of its growth, the period of the year in which it is felled, and the length of time between its felling and converting, are the principal points to be considered, a thorough knowledge and study of which is the only true principle on which we can hope to deal with the warping and converting of timber.

WILLIAM STEVENSON.

Nottingham.

SIR,—It is certainly not creditable to the architectural profession that two edifices, important in the world's history—the International Exhibitions of 1851 and 1862—should have been designed and superintended by non-professional men. Yet it is hardly so much a matter for surprise, when we read some observations made at a meeting of the Institute of British Architects, held on the 23rd December last, by the President, Mr. Tite. That gentleman said: "When he (Mr. Tite) considered it his duty, as President of the Institute, to address some observations to it at the opening meeting, he stated that he would not criticise the International Exhibition, but that he protested against the non-employment of an architect."

It appeared, however, that at a meeting of the Society of Arts, an attack had been made upon the profession of the architect; and the consequence was, the Council had received many letters (and he himself perhaps more) requesting them to take up the cudgels in defence of the profession. Now the Council did not think it became them to do anything of the sort. When a boy, he had heard said that 'calumny and detraction are sparks which, if you do not blow, will go out of themselves.' Further, he (Mr. Tite) permits himself to paraphrase another maxim, and a very stale one too, wherein we were told "Not to answer an unwise man in his want of wisdom," totally forgetting that an unwise man would be most likely to view forbearance as fear.

And now for his protest against the non-employment of an architect; he tells the members of the Institute that it is not necessary for any man to receive professional training to become an eminent architect and engineer!

Now, how can Mr. Tite object to a non-professional man being employed, if he, as a professional man, speaks truly; or does he intend it merely as a piece of courteous flattery to certain architectural prodigies of the nineteenth century? If not, who is the unwise, vider maxim, himself or the public? because, according to his own argument, if it is not necessary to receive any training to rise to eminence as an architect, it is surely unnecessary to receive training to become a third or fourth rate one; therefore, every person who is hard up may put a brass plate on his door inscribed with those much abused titles "architect, engineer, surveyor, &c.," and be a *bona fide* professional man, and thus gain the patronage of a gullible and tolerant public.

Does Mr. Tite think that the protection afforded to the legal and medical professions is superfluous? would he like a military man to defend his cause in court, or perform an operation on any of his limbs? If not, why does he withhold his criticism?

The building for the International Exhibition will, when seen by persons from all parts of the world, be considered a disgrace to the profession and the English nation; yet this might have been prevented.

January 22nd, 1862.

J. S. M.

SIR,—In your notice of the chapel for the North Wales Lunatic Asylum, at Denbigh, the names of the architects were omitted. It was designed by us.

LLOYD WILLIAMS AND UNDERWOOD.

Park-lane, Denbigh, January 28, 1862.

PROFESSIONAL PRACTICE.

SIR,—The enclosed advertisement appeared in last Thursday's *Patriot*, one of the organs of the Independents. At this time of inquiry as to professional practice, it may be worth while to direct attention to such a scandalous offer.

"Bi-Centenary Chapels.—REDUCTION OF FEES.—Mr. —, architect, in consideration of the purport of these proposed chapels, has reduced his fees, and will be happy to prepare plans and superintend the erection of any of these chapels in any part of the kingdom at a commission of 3 per cent. on the outlay. Offices, *

A CONSTANT READER.

WATER IN LEAD PIPES.—An American chemist says that leaden pipes are not acted upon by the water flowing through them at right angles. But whether this is due to the mechanical action of the water at the angle, or to a change in the structure of the lead, he does not say. It is, however, certain that the lead corrodes more rapidly at the bends than at other places. It follows that plumbers should twist the pipes supplied to houses as little as possible; and that turns should be made as gradual as circumstances may admit, and acute angles be avoided.

IMPROVEMENTS IN BUILDING, &c.*

EXCAVATING SAND AND GRAVEL UNDER WATER.—Dated June 15, 1861.—H. J. Kennard, Great George-street, Westminster.

The first part of this invention has for its object the excavation of sand or gravel situated under water, in places where excavations of any description are desirable to be made for foundations or other structures, and consists of an apparatus which is placed on the surface of such sand or gravel, and into which the same is drawn by means of suction. When full of sand or gravel this apparatus is raised out of the water, and is emptied in any convenient place. The apparatus, which may be termed a sand pump, consists of a cylindrical or other shaped water-tight box of wrought or cast iron, or any other suitable material, into the bottom of which is fixed, in a water-tight manner, a tube of convenient diameter, open at both ends and passing upwards inside the box to nearly the top of the same, and continued downwards outside the box to an extent which is governed by the nature of the soil which the pump is to remove. In the top of the box are formed two or more small openings, which are provided with valves opening outwards, and fitting, when closed, in a water-tight manner to the openings; and there is also a larger opening situated in about the centre of the top of the apparatus, over which is fixed, in a water-tight manner, a tube of large diameter, containing a weighted piston working therein in a water-tight, or nearly water-tight manner, and actuated by a rope or chain from above the surface of the water; or a cylindrical bellows or flexible disc may be attached over the before-mentioned opening, and moved up and down, thereby being also a weight attached to the top of the disc. The second part of this invention has the same object as the first part, but the apparatus that is to be lowered down upon the sand or gravel below the water consists of a strong circular or other shaped bag, into which the sand or gravel is driven by the water when in an agitated state, and in which bag the sand or gravel subsides by gravity.

WATER-CLOSETS, AND COCKS USED THEREWITH.—Dated June 18, 1861.—J. Dixon, Newcastle-on-Tyne.

The object of this invention is to simplify the construction of water-closets by dispensing with any connexions to cisterns, except by a pipe which is to be brought either from a cistern or from main pipe, without the necessity of wires, cranks, service boxes, valves, &c. The patentee effects this by forming a communication from the bottom of the water-closet pan or basin to a vessel placed behind the closet, in which is a ball or ball-cock; when the handle or seat is at liberty the valve at bottom of basin is shut, the water rises in the basin, and at the same time flows through the pipe to the vessel behind the basin, and raises the ball, which is connected to a lever in communication with a cock or valve, and shuts off the supply to the basin, leaving the water standing in the basin up to the level of the overflow pipe. In this self-acting water-closet the patentee uses a catamaran cylinder, or a chamber with a flexible disc for holding the valve at bottom of basin tight, and by regulating the supply of water to the cylinder or chamber the basin can be allowed to wash out during any required time. The construction and arrangement of the ball-cock, which can be used for other purposes, is as follows:—Two fixed elastic rings, with a perforated ring between them, are used, and by this arrangement the pressure of the fluid offers no resistance against the spindle of the valve, as it does not press against a seat, but goes into both rings; there is little or no wear on the spindle as it works against the elastic rings, which can be easily removed.

SMOKE-CONSUMING FURNACES.—Dated June 20, 1861.—C. Stevens.

These furnaces are constructed with two grates placed opposite and beneath the boilers, and rectangular openings are made in the horizontal plan of the grates, allowing the divisions of the two fire boxes to communicate with a third compartment, which is situated between them, and in which the smoke is consumed. This third compartment is divided into other compartments corresponding with the openings made in the grates, the number of which must depend on the length of the grate. The small divisions perpendicular to the longitudinal axis of the furnace, and serving to separate the smoke consumer into compartments, are only about half the height of the space which separates the grate from the boilers, thus allowing a free space above by which the products of the combustion are conducted into the flue placed at the upper part of the fire bridge of the furnace.

WARNING APPARATUS.—Dated June 26, 1861.—J. Redfern.

The inventor proposes fixing a fire-grate on the centre of a circular plate. This plate will have attached to it an ash-box with register door, and a cylinder with fire door will be placed upon it, such cylinder having an open top, on which he proposes fitting a syphon tube, connecting this first-named cylinder with a second cylinder, placed in a second circular plate, to which plate will be attached a flue to carry off the gases from the fire to the chimney. The above-named parts of apparatus may be made of iron or other material.

VENTILATING APPARATUS.—Dated June 26, 1861.—S. Wenton.

This relates particularly to the mode of arranging and giving motion to a series of louvre or luffer boards, or flat strips or pieces of wood, metal, glass, or other material, enclosed in a frame, and capable of being placed at any angle, so as to be capable of opening or closing the apertures in which they are placed to any extent desired.

PRESERVING WOOD AND IRON.—Dated June 19, 1861.—J. Cullen.

Here a composition, consisting of coal tar, quick lime, and charcoal, is used. The charcoal is reduced to a fine powder, and such is the case with the quick lime; these materials are to be well mixed together and subjected to heat. To preserve wood, the composition is heated, and the wood is immersed therein.

IRON CASEMENTS.—Dated June 25, 1861.—L. Pierre.

The inventor fixes the framing on the opening to be closed in a small rabbet on both sides, letting it in at the top, its two sides being adjusted to the sill. The sashes are fitted to the framing by plates or fastenings, which fit on to round rods intended to cover the joints. The two sides of the framing carry in their entire height a return or small joint, which, penetrating into a dove-tail lined with a band of caoutchouc, on which it presses, prevents any air or water penetrating by the two sides. At the upper part of the framing, as also at the lower part of the sill, is also fitted a dove-tail lined with caoutchouc, which, receiving a certain pressure by the fastening or bolt (the hooks of which take into the rods), hermetically closes the window.

WINDOW FRAMES AND BLINDS.—Dated June 25, 1861.—J. Brown.

For the purposes of this invention, in order more advantageously to employ wire gauze or perforated blinds, for the purpose of ventilation, the upper part or arch of the opening for a window frame is cut away, if already built, in order to receive an air or perforated block in the form of a keystone, but in new buildings such arch head is to have a perforated block in stone, brick, or iron, with curves at the back of the same introduced in the arch when constructing it. The upper part of the window frame is enclosed above the top of the upper sash, so that there is a hollow chamber at the upper part of the window frame into which air can readily enter from the external air through the perforated block in the arch. In the interior of the room there are one or more openings or air passages into this hollow chamber, which are covered with wire gauze or perforated metal, by which air may pass from the chamber above the sashes to the room, or from the room to the outer atmosphere.

WINDOW-SASH PULLEYS.—Dated July 3, 1861.—J. Terry, Birmingham.

This invention consists in manufacturing the pulleys or rollers of window-sash pulleys, screw pulleys, and upright pulleys, of glass, china, earthenware, or other vitreous or semi-vitreous material, instead of making them of metal, as ordinarily practised.

MANUFACTURE OF BRICKS.—Dated July 5, 1861.—W. England, Wollaston Works, near Stourbridge.

This invention consists in moulding bricks in such forms that no mortar-bed or joint is perceptible upon the face of the work, a rebate or flange upon the edges of each brick concealing the joint.

TENDERS.

STABLING, PUTNEY-HEATH.

For stabling at Putney-heath, for John Bruce, Esq. Mr. Robert Blesley, architect.							
8, Furnival's-inn.							
Fawcett	£525	0	0	Dawson	£319	5	0
Avis and Son	495	0	0	Mauley and Rogers (accepted) ..	415	0	0
Adamson and Son	458	0	0				

DRAINAGE, &c., LOUGHTON.

For clearing, draining and fencing forest land. Mr. William Doyley, surveyor, Loughton.			
Denning.....	£807 0	Pound.....	£216 7
Jarvis.....	286 0	Chilton.....	190 0
Morris.....	220 0		

REPAIRS, &c., CAMDEN-TOWN.

For repairs and alterations at 116, High-street, Camden-town, for Mr. Pain. Mr. Henry McCalla, architect.			
Partridge and Crutch	£225	Porter	£119
Pugh and Wallis	189	Head	112
London Building Company	179	Minty	110
Simmonds and Argent	175		

PULLING-DOWN BUILDINGS, TWICKENHAM.

For pulling down old buildings at Twickenham, for Mr. George Scovell; cleaning and stacking materials. Mr. Henry McCalla, architect.			
Canes	£57 0	Canes	£35 0
Harris	53 13	Tatum	28 15

DRYING LOFTS, BERMONDSEY.

For new drying lofts at Messrs. Glover and Rhinocott's, Long-lane, Bermondsey. Mr.			
F. J. Milman, architect. Quantities supplied.			
Marsland and Son	£550 0 0	Jennings	£497 0 0
Penlington	544 17 0	J. J. and F. Coleman	495 0 0
Leake	512 8 6		

CONTRACTS OPEN.

BANK.

NOTTS.—For the erection of a bank at Oundle, Northamptonshire, for the Stamford, Spalding, and Boston Banking Company. Particulars from Mr. William Eve, surveyor, 3, Union-court, Old Broad-street, E.C. Tenders on or before the 7th of Feb.

HOSPITAL.

DEVONPORT.—For the erection of the Devonport Stonehouse, and Cornwall Hospital, at Devonport. Drawings, &c., with Alfred Norman, architect, Ker-street, Devonport, until the 22nd February, where tenders, sealed, and endorsed "Tender for Hospital at Devonport," must be delivered not later than eleven a.m., on the 24th February.

LUNATIC ASYLUM.

IRELAND.—For the erection of a lunatic asylum, at Letterkenny, for the co. Donegal. Parties who wish to tender, are to signify their intention by letter, directed to Mr. Wilkinson, architect, 49, Westland-row, not later than the 5th February.

BATH-ROOM, &c.

TENBURY WELLS.—For the erection of a bath-room, pump-room, and cottage, at Tenbury, for the Tenbury Wells Improvement Company, Limited. Drawings, &c., at the office of Mr. Norris, solicitor, Tenbury; and further particulars of Mr. James Cranston, architect, 1, Temple-row West, Birmingham; or of Mr. Robert Robinson, Tenbury, Secretary to the Company. Tenders to be sent in to Robert Robinson, Secretary, sealed and endorsed "Tenders for Bath and Pump-room, &c.," on or before the 3rd February.

GAOL.

MONAGHAN.—For the alterations and additions to Monaghan Gaol. Plans, &c., to the 2nd of February next, at the gaol, and at the office of the architect, Mr. John McCuddy, 34, Westland-row, Dublin. Sealed tenders to be delivered at the gaol, before 3rd of February.

RAILWAY OFFICES.

DARLINGTON.—For the erection of offices in connexion with the New Engine Works, at Darlington, of the Stockton and Darlington Railway Company. Plans, &c., to February 5, at the Company's offices, Northgate, Darlington. Tenders are to be sent in on or before February 6, 1862, addressed to the secretary, at the Railway Offices, and endorsed "Tender for Offices."

LODGE.

ESSEX.—For the rebuilding of the principal portion of Witham Lodge, in the county of Essex. Plans, &c., with Mr. Fred. Chancellor, architect, &c., Chelmsford, Essex, and 25, Old Broad-street, London. Quantities will be supplied to these builders who make application for same previous to the 31st inst. Tenders to be delivered to the architect, at Chelmsford, on or before the 7th February.

CHURCHES.

CHESHIRE.—For the works to be done in a new church at present in course of erection at Waterfoot, near Newchurch, Rosendale. Plans, &c., at the Duke of Buccleugh Inn, Waterfoot, on application to the Rev. R. Smith, Glen House, near Newchurch Station. Tenders to be delivered to James Crabtree, Esq., Newchurch, on or before 10th February, 1862.

DEMPRIES (N. B.).—For executing the mason, joiner, plasterer, slater, and plumber works connected with the Free Church to be erected at Kirkmichael, Dumfriesshire. Plans, &c., with Mr. Blues, farmer, Dalruscan, "Linwald, with whom sealed tenders are to be lodged before 11th Feb.

CEMETERY WORKS.

PETERBOROUGH.—For cast-iron palisades for the Peterborough Cemetery, 4½ feet high, with two double-gates of the width of 10 feet at the entrance, and two side gates, 4 feet wide each, with locks and bolts complete, including fixing in the stone, pillars, and coping (which will be erected by the Commissioners), and two coats of red-lead and two coats of paint, of approved color. Sealed tenders, with drawings of the palisades and gates, and the names and addresses of two sureties for the performance of the contract, to be sent to Nelson Wilkinson, clerk to the Commissioners, on or before the 3rd of February. Further particulars may be obtained of Mr. Ruddle, at his office in Newtown, Peterborough.

DWELLING HOUSES.

ST. JOHN'S-WOOD.—For the completion of five houses at St. John's-wood, for the directors of the Temperance Permanent Land and Building Society. Plans, &c., at the offices of the Society. Tenders to be delivered to Henry J. Phillips, secretary, at the offices, 34, Moorgate-street, before four o'clock, on February 4, sealed, and endorsed "Tenders for Houses at St. John's-wood."

SOUTHAMPTON.—For the erection of two houses, &c., on the Belvedere Estate, Southampton, for Mr. John Smith, chemist. Drawings, &c., with Mr. W. Hives, architect,

&c., of Portland-street. Sealed tenders (addressed to Mr. Smith) are to be delivered at Mr. Hives's offices, on or before the 8th February.

NOTTS.—For the erection of a new house and out-office, at Stantonbury, near Wolverton. Plans, &c., at the office of Mr. E. F. Law, architect, Northampton. Tenders, endorsed, to be delivered to the architect on or before the 8th February.

SHEDS, &c.

LONDON.—For the erection of sheds and other buildings, to be constructed chiefly of wood. Drawings, &c., with Henry McCalla, C.E., architect, 25, Westbourne-place, Eaton-square. Tenders to be delivered before 4 p.m., February 3rd.

TIMBER QUAY.

LOWESTOFT.—For the amendment and reconstruction of a timber quay heading to part of the town quay or wharf, on the south side of Lowestoft harbor, and other works connected therewith, in completion of the present quay heading. Plans, &c., at the office of the Town Surveyor, in the Town-hall. Tenders, sealed, to be addressed to James Peto, Esq., and left at the office of the surveyor to the Improvement Commission, by two p.m., of the 8th of February.

BRIDGE.

IRELAND.—For building an iron bridge over the river Fergus, at Ennis. Plans, &c., at the office of the secretary of Grand Jury for the county of Clare. Tenders, sealed and endorsed, "Tender for a Iron Bridge," and directed to the secretary of Grand Jury, co. Clare, by Feb. 13.

DEACON.

SCOTLAND.—For the construction of a small malleable iron beacon for the Commissioners of Northern Lighthouses, conform to plans and specifications made out by Messrs. D. and T. Stevenson, civil engineers, Edinburgh. Plans on application at the office of the Commissioners, 84, George-street, Edinburgh. Tenders, marked "Tenders for Beacon," are to be lodged with Alex. Cunningham, secretary, Northern Lighthouse Office, Edinburgh, before the 3rd February.

MILITARY WORKS.

DUBLIN.—For works to be done in constructing schoolmaster's quarters, at Arbor-hill, Dublin. Parties desiring to tender must leave their names at the District Royal Engineer's Office, Lower Castle-yard, Dublin, or at the Royal Engineer's Office, Royal Barracks, before the 4th February, and pay 10s. 6d. for bill of quantities.

DUBLIN.—For works to be done in constructing a riding school, at Island Bridge Barracks, Dublin. Parties desiring to tender must leave their names at the District Royal Engineer's Office, Lower Castle-yard, Dublin, or at the Royal Engineer's Office, Island Bridge Barracks, before the 8th February, and pay 10s. 6d. for bill of quantities.

YORKSHIRE.—For building a storehouse at Scarborough for the United Corps of Militia Artillery, East and North Yorkshire. Plans, &c., at the Adjutant's Office, No. 19, Mulgrave-terrace, Scarborough; at the offices of Messrs. Leeman and Clark, in York; and at the office of Mr. Trevor, in Northallerton. Sealed tenders, addressed to "The Chairman of the Committee, and marked "Tender for Militia Storehouse, &c.," to the Adjutant's Office, in Scarborough, not later than Tuesday, February 18.

SUPPLY.

BIRKENHEAD.—For the delivery of about 400 tons of cast-iron pipes, of 20 inches, 15 inches, and 12 inches diameter, to the Birkenhead Improvement Commissioners. Specifications and form of tender may be obtained of Mr. Bateman, 16, Great George-street, Westminster, or at the Commissioners' offices, Birkenhead.

LIVERPOOL.—For the supply to the Mersey Docks and Harbor Board of good common Baltic timber, in such quantities and dimensions as are herein specified, viz.:—9,000 cubic feet, in lengths of 42 to 45 feet, and 12 to 14 inches quarter girth; 4,000 cubic feet, in lengths of 16 to 22 feet (average to be not less than 20 feet), and 12 to 14 inches quarter girth; 11,000 cubic feet, lengths of 12 to 16 feet (average to be not less than 14 feet), and 12 to 14 inches quarter girth; or, 24,000 cubic feet in all. The whole to be free from defects of any kind, and to be delivered (free of all charges for carriage, &c.) not later than the 15th June, on the quay of the Mersey Dock, at Birkenhead. Tenders, sealed and endorsed "Tender for Baltic Timber," addressed to the Chairman of the Committee of Works, to be sent in to the Dock Office, Liverpool, not later than 10 a.m. on the 6th February.

SANDOWN.—For the supply of about 1,600 feet of 12-inch stoneware socket pipes, and about 1,100 feet of 9-inch ditto, with junctions and bends, for the Sandown Local Board of Health. The specification, with the conditions of contract, at the office of the Surveyor, Mr. F. Newman, 16, George-street, Ryde. Sealed tenders to be delivered to T. B. Hall, clerk to the Local Board, Sandown, Isle of Wight, by noon, on February 14th, and endorsed "Tender for Stoneware Pipes."

CONVICT PRISONS.—For the supply of timbers, deals, slates, lime, sand, bricks, lead, glass, wrought and cast iron, ironmongery, gas and water pipes, white lead, oils, &c., for 12 months from the 1st of April next, to the 31st of March, 1863, for the Pentonville, Millbank, Brixton, Portland, Portsmouth, Chatham, Parkhurst, Dartmoor, and Woking Prisons, and the Refuge at Fulham. Tenders, pre-paid, addressed "The Directors of Convict Prisons, 45, Parliament-street, Westminster, S.W., on or before noon of the 1st March. Forms of tenders at the several prisons before named, or at the office of the Directors, 45, Parliament-street, on and after the 15th February.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favor us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

J. C.—Thanks; next week.

JAMES F. D.—Not quite to the point.

G. C.—Shall hear from us.

S. R. K.—We cannot comply.

O. C.—Thanks.

M. T.—E.—Does not meet the case.

D. S. P.—Letter has been sent, decision is not yet known.

E. H.—Declined with thanks.

W. R. G.—Impossible for us to attend to such requests.

M.—Will find reply on another page.

DUPRELS.—Use the best cement, or, perhaps, artificial stone.

G. S. X.—We should be sorry to mislead in consequence of possessing imperfect information. Ask a solicitor.

V. K.—Try again. We think differently.

S.—Will receive a letter.

N. B.—This week.

W. X. R.—Tracing has been received, and subject shall be engraved.

G. W.—Suggestion has been received.

W. S.—We shall be glad to see promised paper.

R. B.—See notice in a late number.

A. M.—Glad to receive additional notes.

A. SUBSCRIBER (Dalketh).—Apply to our publisher.

M. S.—Might have made his "request" in courteous terms; we should have something to do were we to charge ourselves with the return of rejected matter.

B. X. B.—Shall receive attention. Thanks for sketches.

NOTICE.

The Seventh Volume of the BUILDING NEWS is now ready, bound in cloth, price 21s.

Subscribers can have their copies bound, either with or without the advertisement pages, for 4s. 6d., on sending them to the office. Cases ready for binding the volume may be had price 2s. each.

* All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Bow-street, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 15 to 21, Old Bow-street. Advertisements are received up to six o'clock on Thursdays.

THE ASSOCIATES OF THE INSTITUTE.

HERE is room for progress in most public bodies; and those corporations and societies have ordinarily been the most useful, the most honoured, and the most powerful, which have constantly endeavored to keep themselves abreast, if not ahead, of the course of things around them. The Royal Institute of British Architects is no exception to this rule. Whatever may have been the exact exigencies of the time at which it was constituted, there can be no doubt that, in order for it to maintain unchallenged the head of the profession, certain alterations in the customs—perhaps, some changes in the constitution then established—have become necessary from time to time; and it is equally true that just so far as those alterations have been recognised and acted upon, has the popularity, the power, and the vitality of the Society increased.

We recognise gladly such features in the recent history of the Institute as the gradual increase in the value and practical interest of the papers and discussions, the location of the Society in a build-

ing where it is brought into near neighborhood with all the other architectural bodies, and the election in succession of two very eminent practising architects to the post of President. The increased number of prizes open to students, and, above all, the continued and increasing attention bestowed upon matters of professional interest—such as the proposed voluntary examinations, the conduct of architectural practice, and the like, are all circumstances that give gratifying evidence of the energy and elasticity of the Society, and its desire to benefit the profession at large, and all give promise that no really necessary reform will be long overlooked or postponed if the members can once be brought to acknowledge its importance.

The condition of the Institute has long presented an anomaly which has often provoked complaint, and which we consider to be one of the first matters deserving attention; we refer to the unfortunate working of the division of its members into Fellows and Associates, a division which, even if right in principle, is not correct as applied by the Institute, and is the occasion of much that hinders the prosperity of the body, and that to an extent greater than is suspected by many.

The profession of architecture may be said to be really divided into two great classes, each comprising many men of skill and experience, but widely different in their relation to professional practice; these classes consist of those who are and those who are not in responsible practice on their own account.

This distinction is broad, intelligible, and real. On the one hand we have a body of men whose conduct in matters relating to practice, whose customs in matters relating to valuation, whose evidence as given in courts of law, and whose daily habits, form the customs and precedents of the profession.

The youngest of these can do harm by improper practice, or can do good by maintaining, as opportunity offers, principles of justice and fairness, and the oldest cannot afford to go counter to the general expression of the opinion of this body of men. No man in actual practice and in any way recognised by his brethren, can commit an unworthy action without inflicting a blow upon the profession, and each one who is courteous, accomplished, distinguished, and successful, reflects honor on the whole body. It is then in the highest degree desirable that these men should be knit together into one community, and that as strong a feeling of union and mutual assistance and dependence as possible should be fostered. It is most desirable also that the younger men should, from the first, feel that they are responsible for what they do to a public opinion of their own body, and that, on the other hand, they are so affiliated to that body, as that their best energies and much of their leisure time is fairly due, and ought to be devoted to objects of common importance. It is equally necessary that the leaders and patriarchs of the profession should welcome the newcomers as men embarked on the same voyage as themselves, or, to put the matter proverbially, men "sailing in the same boat." On the other hand, the large body of architectural men not actually in responsible practice, while it no doubt comprehends many whose energies and knowledge are of great value, includes, in the very nature of things, hardly any whose opinions, customs, or practice, can have a wide influence on the profession at large. The responsibility makes the difference, and together with it there is a difference in professional position between a man who receives orders from another in the same office, and one who does not, which cannot be overlooked.

There can be no doubt that the true constitution of an Architectural Society would admit this difference, that its members ought to consist exclusively of men in responsible practice, and its auxiliary members of men not yet so engaged. This being so, there can be no doubt that, while the personal weight of the senior members and their long experience would always secure to them the direction of the affairs of the Society, the energies of young men would from the first be enlisted, and a most salutary sense of the responsibility they assume on entering practice would be excited.

Now, what is the actual state of the case?

In the Institute we have a division into Fellows and Associates, the former being the only *bona fide* members, as they alone are entitled to vote.

Instead, however, of this division being dependent on the test we have shown to be the natural one, the actual qualifications for becoming a Fellow are, first, the intending Fellow must have been seven years in responsible practice; secondly, he must be willing to pay four guineas a year in place of two; and, thirdly, he must make a declaration, the practical interpretation of which is that he will not measure works for builders.

This artificial distinction ought, we consider, to be removed, and we have little doubt that the day will come when it will be removed. Among the results of it may be traced the following undesirable, but existing, circumstances.

The Institute at the present moment is deprived of the membership of a considerable number of useful men who do not choose to enter as Associates, and have not been long enough in practice to enter as Fellows. Of these the majority are lost altogether, because, having kept aloof for seven years, they commonly feel, when the eighth comes, that they care nothing about membership, and remain permanently away.

The Institute includes a heterogeneous body of Associates, which, while embracing a certain number of assistants and students, the only legitimate class from whom this body ought to be recruited, includes also a considerable number of men in practice who are not yet eligible on account of having been fewer than the "perfect number" of years on their own responsibility, and a good many others eligible, indeed, as far as years of practice go, but who elect to remain Associates, some because they have taken up measuring as part of their practice, some because they do not choose to double their subscription, and many because the treatment they have received as Associates has not encouraged them to seek a more intimate connexion with the body.

It would be introducing a topic that would swell this paper beyond all bounds were we to introduce and examine the question of measuring. An opportunity may occur of doing that, but in what we are now saying we are obliged to leave out of consideration the claims of those Associates who remain so because they prefer to be able to measure, if they like, and we are content to base our argument solely on the unsuitableness of marking off so large a number of educated, energetic men in responsible practice, as though their youth necessarily disqualified them from being admitted members, and we maintain that the advantages to be derived from securing the hearty uncompromising co-operation of these members of the body would be well worth securing.

Sometimes, however, the difficulties of a formal revision of legally settled rules, such as those established by a Royal charter, is so great that one is obliged to be content with an informal but practical remedy for temporary purposes. Has any such practical remedy been applied?

We regret to be forced to admit that the false position in which the larger part of the Associates of the Institute are placed by the constitution of the Society, has not been always counteracted, as it might, by the habitual and customary modes of procedure, but that the contrary has at times been the case. Associates have had to complain, and with great reason, that the tone adopted towards them, as a body, is not that to which many of them, as individuals, are fairly entitled; they feel that not only does their inability to vote tell against them—a circumstance which, as matters stand, cannot be helped—but that too often the tone adopted is as though they, notwithstanding any amount of practice, of personal devotion to the profession, of education, and of ability, are in no way to be held as of much account, are not to be admitted as equals, but, if they speak, are to be listened to with condescension and toleration, and if they object, are to be put down as turbulent and ambitious.

Architects are gentlemen, and, therefore, all this is done with a certain amount of courtesy and amenity of manner; but other architects are also gentlemen, and the position they are forced to be content with is none the less galling to them, because, if sometimes cuttingly reminded of it, those reminders are not also coarse; and we do hope that this serious element of weakness will be considered, and, as far as possible, amended.

One remedy, the most effectual but by no means the most desirable, lies at the disposal of the Associates themselves did they but choose to use it. Let but the present Associates remain as they are without becoming Fellows, and in a few years the character and importance of the Associate body would be raised to such a pitch, by increasing numbers and increasing weight of character as would compel any desired recognition. This course, however, is neither desirable nor easy; if practicable, it would involve a sort of hostile combination which we should be glad to see avoided, and it would always be liable to fail, as the good intentions of many a valiant hearted Associate have already fallen, under well-directed invitations from some of the higher powers to "come up for a Fellow."

A better course, and one more worthy of the spirit proper to the members of a liberal profession, would be, that those who take the lead in the society should more habitually and constantly recognise, in the way that some of them from time to time do, the claims of the Associates to attention and consideration, and should include some of the Associates more frequently than has commonly been the case in committees, deputations and the like. We are not, in referring to this subject, touching upon an imaginary grievance—and in sketching out this mode of palliating it, we are not suggesting an impossible or an unnecessary course—and in suggesting as we have done the possibility of combination and hostility, we are merely repeating what has been said scores of times already. Let us hope that the matter will receive proper attention from the proper quarter, and in the proper spirit.

THE EXHIBITION BUILDING.

AS the time approaches for the building to be delivered over to the Commissioners, all doubt as to the sufficient completion of the contract seems to vanish. We can estimate pretty fairly the ability of the contractors to do the little which remains to be done by the magnitude of the work now finished. A little rivalry between the respective superintendents of the eastern and western domes has put both gentlemen upon their mettle, and every nerve and sinew is tightened to the work. As far as we can see, little beyond the surmounting finials and the glass remain to be added to either of them. The ponderous ribs are fixed, and the sashes are in their places. We shall soon hear the last of the incessant hammering of rivets, and be enabled, by the removal of the scaffolding, to get a proper view of the domes. The staircases are erected, although we fear there are not enough of them, in different parts of the building. The foundations are laid for the small iron colonnade under the eastern entrance archway. Scaffolding is only seen here and there in isolated patches against the exterior of the building. The "lengthened dullness long drawn out," which forms the Cromwell-road front, is revealed in all its painful baldness. One spark of ornament alone flickers along the dreary waste of piled bricks; and in noticing the iron ventilators over the windows, we feel very much as Garrick did when, sitting sadly at the performance of a party of amateurs, he saw an actor—retained for a part too insignificant for the principals—step for a moment on the stage; "Thank God, there's an actor at last!" he exclaimed. So with the design of this ironwork. There is really some taste visible in it, but it is a very small lump to leaven so huge a mass—a "cup of sack thrown into Thames water."

The covering-in of the northern courts proceeds rapidly, and the rooms over the southern arcade of the Horticultural Society are roofed. The elevation of them is in unison with the architecture which they surmount. Each bay is divided into three semicircular openings. The view of them will be almost as pleasant as the prospect will be from them when the grounds are once again decked with summer flowers.

The great point of attraction to the visitors for the last fortnight has, however, been the nave, where various experiments in color have been exhibited, and certainly it has been a curious spectacle. The more ambitious amongst the amateurs of South Kensington have each fastened on a bay of the nave, and written themselves down incompetent. One gentleman covered his ribs with brown ochre, gashed with short stripes of a deeper tint, after the fashion of savages. Another introduces a German element, and reminds us of their striped blue and white sentry-boxes. In another bay we look upon blue ribs with white imposed ornament, and yellow columns with white chamfers. Another specimen—and this, we believe, is the architect's—introduces us to the fashionable "mauve" in the columns, with the same fast color alternately with white in the ceiling. The best specimen, taken as simple decoration, is the contractor's, Mr. Kelk's; it consists of pale green columns, with bright red chamfers; the ribs are buff, but the central of the five boards which constitute it is painted green, thus carrying the color over, and connecting the two sides. We don't, however, altogether like the patches of blue ornament on the buff ribs. The different style of coloring seems, however, to have satisfied no one except—as one of the papers remarked—their own respective authors. It strikes us that all the attempts have been made upon a wrong principle. The object in coloring a building of this kind ought to be to obtain a neutral and unobtrusive background for the objects exhibited in it, instead of which each decorator has seemingly striven to show his work, and to spread a reputation over the surface of the building.

We have been told over and over again that the building was never intended to be other than a useful one, and yet half-a-dozen or more gentlemen are permitted, we hope at their own expense, to display their peculiar crotchets on decoration, in the hope of rendering it ornamental and themselves famous. Neither hope is likely to be realised. One would have thought that the easiest plan would have been to have entrusted the design of the decoration to Mr. Owen Jones—who knows more about color than all the officials of South Kensington put together—with the task. Had this been done two months ago, the style would have been settled long ago, and the building have, before now, been half colored. His successful treatment of the interior of the 1851 building ought to have been sufficient to over-ride any jealousy about having an architect, even at this late hour, employed on the work; whereas the want of a competent man to do it, and the substitution of experimentalists, has caused already a very serious delay, for, until the nave is painted, the flooring cannot be laid; nor can, consequently, the cases of goods be received, or, at any rate, opened. The last experiment has been made by Mr. Crace. It is a fine bit of decoration. The polygonal form of the ribs is distinctly marked by alternate red and blue bands, with Pompeian ornament on it. At each angle, separating them, there is a small gilt circle. The caps of the columns are gilt, picked out with blue or red. The name of a country is written on the central blue band forming the crown of the rib. The ceiling is painted grey, with red ornament on it, between the ribs, following the rake of the roof. A fringe of green and red is put on either side of the ridge-piece, and a somewhat similar band above the plates. But as the whole framework of the rib is not thus strongly painted, but only the polygonal portion, it gives a weak appearance to the rib, which it does not possess without it. Moreover, this style of decoration will not only be very costly—far more so, indeed, than is warranted by the architectural or the temporary character of the building—but it will attract the visitor's eye, instead of being a background for exhibited objects. It is pure waste of money to gild such a structure as the Exhibition, for not all the gold in Australia can render it a work of art. The folly would only

be surpassed by that of putting mosaics, as is contemplated, on the blank walls in Cromwell-road. No decorator should be suffered to color it who will not undertake to limit himself to the employment of three tints. If they will not suffice, it would be better to save time, labor, and money, and show it in its true colors to the world—a temporary, watertight shed, with a certain amount of simple beauty in its nave and transepts.

The picture gallery, which extends the whole length of Cromwell-road, is—as has been asserted by the official admirer of the building and all connected with it—perhaps, without a rival in the world. It is lengthy, of sufficient width, and faultless in point of light. No pictures could be hung in a better gallery to display their qualities. We render to Captain Fowke this tribute of praise, because he has earned it; but we must also say that no gallery could, by hardly any possibility, be uglier. The heavy principal rafters are like the timbers of a crane; the cove which connects the skylight with the walls is fearfully oppressive. If this were all, we should, for the sake of the main desiderate which Captain Fowke has given us, have been silent on the matter, thinking that economy and lack of funds had restrained his hand and limited the ebullition of his taste; but it could not have been a deficiency of pecuniary means which inflicted on us that cumbrous cornice, or the still heavier plaster string which robs the gallery of a large portion of its apparent size. The bands round the doorways are effective, because nothing beyond the simplest forms has been attempted. It is consolatory, at all events, to know that the pictures will be seen, and seen, also, to the best advantage.

The eastern annexe is more than three parts completed, and the ground is now broken to form a communication, under the entrance hall of the Horticultural grounds, with the main building. This communication will be by four arched galleries, each 10 feet wide, two for egress and two for ingress. The ribs of this annexe are precisely similar to those of the western one, but the 50-feet galleries are arranged with an open court between them instead of being side by side as on the other side of the grounds.

THE QUEEN'S CONCERT ROOMS, HANOVER SQUARE.

SHOPS famous for the good quality of their wares, and places of public resort noted for the excellence of their entertainment, may for a long time dispense with that costly decoration which is an absolute and periodical necessity to inferior establishments. We get, through long associations, to like even the ugly attributes of the rooms of houses wherein we have been always well treated, as we do that of a familiar, although not handsome face, which, growing daily older, smiles with unvarying kindness upon us. Even the old-fashioned garments which keep a good and worthy man warm and comfortable give us pleasure. If the metal be sterling, we have a certain affection for the purse which has for years secured it to us. The plainness of the covering is certainly no sign of the goodness of the thing covered, but for its sake we look kindly upon it. What man that is "moved with concord of sweet sounds" ever passed the Hanover-square Rooms without bestowing a glance of grateful recognition upon the grimy brick walls within which for years have undulated the richest waves of harmony? The numerous concert-rooms and music-halls which have sprung up in all parts of London, gladly as we welcome them, do not diminish our attachment to the old rooms. The Hanover-square Rooms contain, perhaps, the best concert-room in acoustic qualities to be found in London, and thus still furnish the fittest home for the world-famous and unrivalled Philharmonic Band. The choicest treat to all lovers of good music is partaken there. The Philharmonic was founded to lead public taste, not to follow the caprices of fashion. It has done noble work, but as great a career lies before it as that which has already given it renown. The rooms to which these concerts have given an enviable reputation, unable, however, any longer to resist the tempting charms of the decorator, have been recently unveiled, and display attractions on their walls which they never before possessed, and which are commensurate with those found within them. They are now, we are informed on a printed bill, deemed suitable not only for concerts, but "balls, Sabbath services, bazaars, and the meetings of religious and other societies." We shall not criticise the new ornamentation in reference to its suitability to such varied and widely different purposes. It has been decorated as a concert-room. The walls bear in medallions, on a gold ground, the representations of eminent composers. Small bas-reliefs refer allegorically to the charms of instrumental and of vocal music. The larger spaces between the gilded pilasters are filled with large mirrors, and the whole apartment is decorated with a gorgeousness of color and gold-leaf which tells immediately the object of the designer. The main walls are tinted a warm grey color, which forms a border to the pale green panels upon them. Small Cupidons in oval panels decorate the lower portions of the room, whilst above we see the medallions of composers which we have already noticed. A bright red line on the gilt enriched edging of the panels has a very fine effect, and is most tastefully introduced. The skirting of the room is an imitation of various marbles. The pilasters and pilaster caps are profusely gilt, and the frieze is picked out with blue color to give effect to the festoons with which it is decorated. The general tint of the waggon-headed ceiling is a light green, similar to that of the wall panels. It is subdivided with gilt mouldings, and enriched with colored borders. The old pictures are still preserved in the ceiling, and massive frames enclose them. Their position has seemingly determined the shape and size of the ceiling panels. A band of blue color, with white trellis ornament, partly gilt, is carried at intervals across the ceiling, apparently to connect the color conspicuous in the frieze. Some well-designed surface ornament has been put upon the panels of the walls.

The orchestra is in its lower compartments faced with silvered glass, whilst above white and gold ornamental panels stand out sufficiently from the grey and green ground.

The front of the Royal box and gallery is perhaps the best piece of design in the room. It is composed of small circles, most dexterously and artistically arranged. The outline of the front is an inverted ogee. It is tinted in white buff and gold. The Royal Arms are one mass of rich gilding. The whole of the carton pierre work has been done by Messrs. Jackson, of Rathbone-place. The room is at night well lighted by "sun burners" and reflecting silvered globes, put up by Mullett and Co., of Holborn.

The buffet at the side is elegantly embellished. The supper-room below is painted in imitation of foreign marbles, with occasional patches of red and blue color behind the enrichments.

The whole of the decoration has been carried out by Mr. C. Smith, of Baker-street, from the designs and under the superintendence of Mr. Thomas Dyke, architect, of Marylebone-road.

SOCIETY OF FEMALE ARTISTS.

THE ladies of this society have the honor of inaugurating the most extraordinary picture season this country has yet known, for, in addition to the regularly established annuals of home growth, we shall have, when the Great International Exhibition opens, examples by all the most eminent artists of whom the civilised world can boast. As foreign courts have the power of deciding at what period they will commence the history of art, the English school, beginning with Hogarth, will have to sustain a shock of arms, particularly when our painters of the present day encounter their contemporaries from the other side of the Channel, from which they will in all probability emerge sadder but wiser men. Let us, however, not anticipate defeat, but confine our thoughts to the subject immediately under consideration. The principal change in the present exhibition of the Society of Female Artists is a sensible reduction in the number of works exhibited. Now, as there is still plenty of wall-room above "the line," we think bad drawings or pictures would have been better than the old, dirty, and patched paper which is now, by that discriminating process, become prominent to the sight. We have a conviction, in which we are supported by the French, that it is both fair and beneficial to art that while space can be found every picture sent should be exhibited. By this arrangement the crime of painting a bad picture receives immediate punishment by public exposure. This is far more convincing to the delinquent than rejection. The refusal to hang a picture implies a preference of others offensive to the self-esteem of the painter, but hang it up by the side of those preferred and he receives a silent censure, which lasts during the whole time it is exposed to public view, and if there is any real good in him, he wishes it at home again long before the time has expired. The exhibition of his picture also induces a young artist to take an interest in those by which it is surrounded, and he must improve by comparison, when his jealousy is not excited. He may hear his crude work criticised; he may see that it is constantly passed without attracting attention, and, above all, he may have the mortification of seeing his grand effort unmercifully laughed at. If it be in his nature to learn at all, he will then learn something greatly to his advantage. These remarks rest, however, upon the supposition of plenty of room, which happens to have been the case in the present exhibition, and we therefore think the number of pictures and drawings should not have been unnecessarily reduced through fear of the fastidious notions of either the press or of visitors.

Taking things, however, as we find them, we think the general aspect of the room is more satisfactory than it was last year. Several of the former contributors are missing, and we particularly remarked the absence of Mrs. Murray, of Teneriffe, whose dashing water-color drawings, which, if we could not always praise, gave a masculine feature to the gallery, by their powerful coloring and vigorous drawing, which was highly advantageous to artists whose feeble productions came into close comparison with them. The loss of this striking point has reduced the general aspect to a more equable character, but, at the same time, it cannot be denied, even if we wished it, that there are some very meritorious works, in nearly each branch of art.

The historical will be confined to a well-painted picture by Miss Kate Swift, entitled, "The Escape of Grotius from Lœnstein." We think this lady has not given her title due consideration, because Grotius, her hero, is not visible, being concealed in the box carried away. Catalogue in hand, the present title may answer the purpose; but what will be understood by the picture hereafter, when there is no explanation, must be left to the ingenuity of posterity. There is considerable dignity in the attitude of the lady ordering the box into the boat, and the whole of this figure is extremely well painted, but the rest of the figures are poor in comparison. "Give me a Hand," by the same artist, although unfinished, we like better. The outline of the female carrying a pail on her head is full and flowing, the folds of her dress are grouped in simple masses, and the head and extremities are extremely well understood. There is also some merit in "Peace likely to be Broken;" and the "Portrait of a Child" is painted with a full and firm pencil: all the features and undulations of the face are intelligibly expressed, but it seems to us that there was a strong indication of premature age in one so young, as if the photograph had done duty for the sitter; and the direction of the lines describing the contour of the upper part of the head does not range with those which regulate the features and lower parts of the face. But the most ambitious attempt connected with the human form is a female head by Mrs. H. Moseley. The expression is most life-like and intellectual,

the drawing of the features is elevated and spiritual, and the coloring is judiciously subdued to give those high qualities their due importance with the spectator. This excellent work is an imaginary head of Shakspeare's Miranda, from the "Tempest," and it expresses the wonder and delight of Miranda when she meets Fernando for the first time on the Enchanted Island. Next in degree of merit in figure painting is "The Absent Scholar," by Mdlle. Sophie Jobert. The three figures—the absent scholar, immersed in his book, holds out his hand for a glass of water, which a pretty maid is about to give him; but her duty to her master is somewhat retarded by his secretary, who is diverting her attention by a little furtive flirtation. The whole of this picture is in excellent tone, and the composition is generally well arranged, with the exception of the diagonal line formed by the table-cover, which is a spasmodic effort at ease which defeats the intention. Mrs. Backhouse continues to contribute her powerfully colored half-length subjects, which generally belong to the class now known as "servant-girlism." One of these is entitled "Beginning Life"—a young aspirant for domestic honors or annoyances, as events may prove, who handles her first broom in a manner singularly suggestive of the probable mischief she will, in course of time, do with it. In the next picture we see her, after having been "A Year in Place," more cool and hardened to her diurnal depredations, having taught her mistress the necessary powers of endurance by her having consented to remain in her place so long. Mrs. Backhouse exhibits several others, which display her power of drawing, and, in most instances, her habit of forcing her tints beyond the truth of nature.

There are several French female artists who regularly exhibit with those of this society. Mdlle. Eudes de Guimard displays great versatility in the selection of her subjects and the management of their effects. "The School in Normandy" is a very talented production, in which the brightly luminous edgings on the figures of the female scholars, from a side window, are well sustained by the sombre tints of their dresses in shade, and the whole is thrown into breadth by the white cap and black gown of *la religieuse*, who is standing up giving them their lesson. "A Child Looking at Prints" is arranged on quite a different scale. The tone is cool and clear, the pencilling is very firm and distinct, and the whole effect fresh and bright. The minute detail of this latter picture very little prepares one for the breadth and spirit in the larger work of "A Young Girl Caressing a Dove." It has a lively and playful action, and is in every respect very cleverly drawn and painted. "The Knitter" is by Madame Marie Chosson. The female figure in this picture has that easy attitude and evident power of mobility which distinguish the French school in this branch of art. This admirable effect is, we believe, obtained by a little exaggeration of the aerial perspective, and the delicate mode in which the outline is made to melt into space, which detaches the figure from the background, the same feeling being carried through the lesser divisions of the subject, which, instead of appearing fixed by strong outline and firm shadows, gives the appearance of freedom and motion. This ease of attitude will also be found in "The Little Coquette," by Angélique Razé, which is elegantly treated and delicately colored.*

DRAINAGE IN IRELAND.

A MEETING of landed proprietors of the district affected by the drainage of Lough Corrib has taken place at Galway, and adopted resolutions, and a memorial to the Lords of the Treasury, expressing dissatisfaction at the way in which the Board of Works performed the drainage. They are charged with the sum of £28,000, and interest at 4 per cent., and yet they say they are in a position to prove on oath, before any impartial engineer, perfectly independent of the Board of Works, or of memorialists, that the lands charged with this £28,000 have been rendered almost useless, and in several instances back-water has flowed over the lands hitherto dry, and the seed has been washed out of the land by the overflow of the lake, thereby rendering both capital and labor a total loss. That several of the memorialists, acting on the faith that the arterial drainage was perfected, had extensive drainage done on their estates, but, in consequence of the defect above complained of, their labor and capital are also lost. Therefore, they pray their lordships will immediately institute an inquiry into the truth of those allegations, and appoint an impartial engineer to examine into the condition of the lands, in order either to make the drainage effective, or to render the memorialists such other relief as the justice and fairness of the case demand.

THE DOCK WORKS, DUNDEE.

ANOTHER disaster of a most serious nature has occurred at the New Dock works, by which the east wall of the lock of Camperdown Dock has been ruined in a moment. After the failure in October last of the east wall of the dock, it was resolved by the trustees to exclude the sewage from the lock, pending the construction of a new sewer at a distance from the dock walls, by a cofferdam at its northern extremity; and a contract was concluded with Carstairs, Mitchell, and Co. to execute the work, and to pump out the sewerage from the lock, under the superintendence of Mr. Leslie and Mr. Stevenson, engineers. This work went on successfully until the cofferdam was completed and the sewage almost pumped out, and operations were in progress for preparing to complete the masonry of the lock walls. No one about the works had the least suspicion of danger or of risk. About a quarter to six, however, after the work of the day had ended, the watchman on the works was suddenly alarmed by a loud noise, caused by a discharge of sewage bursting from the bottom at a point to the southward of the lock. It was discovered that the wall was rent throughout its whole length, and the lock speedily filling with sewage.

The accident will be of the most serious consequence to the completion of the works.

* We will complete our notice of these works next week.

THE PRINCE CONSORT'S MONUMENT.

THE nation, which a few weeks ago bowed itself down with grief at the loss of the Prince Consort, has now resolved, in calm, sober earnestness, becomingly to honor his memory. Meetings have been held in various places, and they prove the natural and complete unanimity of the people, who have only appreciated thier loss and his worth when the active brain is still, the warm heart beats no more, and the liberal hand is closed in death. There will, we are confident, be no lack of means to rear a fitting monument and to express the country's gratitude. Our only fear is that the crowd of philanthropic gentlemen, each with his well-trained hobby, will ride rudely in and disturb the quiet character of our action. A man with a pet crotchety is notoriously persevering; all other subjects are, in his mind, subservient to it; everything must be absorbed to satisfy its appetite; no obstacle can check him—no argument can modify his ardour or dim the sense of its supreme importance. To this concentration of all his energies to the one point the hobby-rider owes, perhaps, his success—or, at all events, a greater portion of it. The very fact that the departed Prince aided their several institutions leads each to believe that it occupied the most prominent place in his thoughts. Thus we have the promoters of soup kitchens, boulevards, model cottages, baths and wash-houses, industrial universities, lodging houses, and other, in themselves, unexceptionable establishments, anxious to make themselves a lasting monument by having the Prince's name and the money subscribed to do honor to his memory attached in perpetuity to the object of their solicitude.

We do not wish to utter a disparaging word of any of these institutions, but we protest against the Prince's monument being made a simple hoarding even for the display of philanthropic advertisements. There is a selfishness about the proceeding altogether incompatible with that spirit which ought to animate us. Even the specious plea of combining the useful with the monumental cannot be entertained. We do not want to make capital out of our loss, nor do we expect a profitable return for the payment of a debt of gratitude. Even the assertion by the indefatigable Mr. Cole, that versions of his scheme of an industrial university are known to exist, drawn up by the Prince himself in great detail, does not reconcile us to it for this purpose. The same argument applies with equal force to anything else which the Prince was preparing before his fatal illness struck him. On its own merits, when it is fairly laid before us, just as we should have done if the Prince had lived to introduce it, we will hereafter consider the subject; but we do not want it mixed up with the Prince Consort's monument. A complete design, with contractor's estimate, may, for aught we know, be prepared at South Kensington; and the whole thing may some morning be presented, cut and dried, for public acceptance. Fortunately, we cannot again be forced by circumstances into acquiescence with these plans. We have had one example of the art-productions of that favored institution.

The successful Exhibition proceedings will find no counterpart in the Prince's monument. To commemorate an art-patron we need the assistance of artists, of men who have something more than the Exhibition building and the praise of it to point to as the result of their working brains.

Against all useful schemes, of whatever kind, we strongly protest. They all have a party character about them which is incompatible with the object in view. A monument is the only memorial which will speak to all classes and to all generations; it is the only form in which the Prince and his actions could be made to fill the undivided thoughts of every spectator. We should, in looking upon it, dwell only on his good and serviceable life, on his wise and generous counsels, on the influence of his bright examples, on all, in fact, which appertained to him instead of having our reflections divided into other channels. The higher the art which may be developed in the monument the greater would be the pleasure felt by educated men who stand before it, whilst to the humblest citizen of that England which he honored and enriched, it would tell its simple, unalloyed tale. We would go even still further, and say that a plain granite slab with the name of Albert cut upon it would better commemorate his virtues than the most costly university which, under Mr. Cole's auspices, might be reared. In the one his merits would stand unbought to the world, in the other they would be "veiled in modest allegory."

The philanthropic and industrial gentlemen are not, however, the only consequential intruders in this matter, whose services can easily be dispensed with. The old proposition for transporting Cleopatra's needle is again revived, and put forward as a fitting token of respect to England's Prince. If the obelisk had been worth transporting, and had been in any way equal to those in the Place de la Concorde and the Piazza di San Pietro, it would have been set up here in London long ago; but the truth is, neglect, time and weather have cut records on it which not even Champollion could decipher. It is a monolith of a certain antiquarian value, but, half buried on the sea shore of Alexandria, it interests more people than it would in England. As a monument to a Christian prince, its hieroglyphics are an absurdity; it would be as sensible to set up an Assyrian bull or a statue of Vishnu. Less inappropriate, but belonging to the same class of suggestions, is that for carrying out Mr. Scott's Crimean memorial. The cross we can fully believe was well and artistically designed, but it was designed for an expressly different purpose than that for which we now desire a monument. If it was appropriate to the Guards who fell for their country, it was consequently a military monument; their martial deeds formed its especial characteristics, and a war-inspiring sentiment pervaded it. The fact of its successful treatment forms the insurmountable objection to its fitness for the present sad occasion. The circumstance strongly urged, of its being admired by

the Prince Consort, adds nothing to the value of the suggestion, but rather strengthens the opposition to it. We want, in short, no ready-made monuments for the Prince foisted upon us, not even that of the barefaced Mr. Keyse, whose grand military and naval trophy with Corinthian caps and gorgeous compositions, excites his own admiration and stimulates his obtrusiveness. Self-confidence leads this man to expect the public will not only inspect his work, but subscribe a million and a half for the fulfilment of his intentions. The "building of the trophy will be constructed," we are told, on a novel principle. We cannot but consider this highly probable, when the projector constitutes in himself architect, builder and banker. As we wash mud from a glass, we would remove such an intruder from reflections on Prince Albert's monument. We never heard of him before now, and we do not care to meet with his name again.

The London and Manchester Committee have done well in confining themselves to the simple resolution that the tribute to the Prince's memory shall be monumental, and in deferring future considerations as to details. This is as it should be. Artists and sculptors are the proper persons to show us what an original monument ought to be. They neither need to be told what it should express any more than they require to be informed upon its posture. It is their business to embody in bronze or marble the character of the man, to make it express his various excellencies, to depict thereon his domestic solicitude, his steadfast godliness, and his enlightened public acts; to portray to future ages how he employed his great talents unostentatiously, yet wisely, for England's welfare by fostering agriculture, promoting education, encouraging the arts, and extending a friendly hand to the suffering poor. The less our sculptors are fettered, the more satisfactory will the monument be, and that we should have one worthy of the deceased Prince is the wish of all of us. It would be as unbecoming for statesmen and divines dogmatically to dictate details to artists as for the latter to attempt to influence the formation of a sermon or a foreign policy. All we demand is a fair field for the exercise of our sculptors' talent, and that bustling activity and intrusive impudence shall not be suffered to thrust themselves forward and snatch the honor of executing the work from competent hands.

The idea elicited at Manchester of a temple containing a statue was perhaps the happiest which the melancholy circumstances have yet occasioned. The temple would, of course, be detached; its interior might be adorned with bas-reliefs or paintings; the floor, walls, and ceiling, would allow of large space for decoration; the openings, glazed with plate glass, might permit the ordinary passers-by to see the white marble statue in the centre, protected from the dust, rain, and soot of our London streets, whilst, under proper regulations, the public might be admitted to enter and look upon the detailed records of the Prince's goodness and of the service which he rendered to us.*

This is only one of many ideas published, and it strikes us as the best. It would be appropriate, and put forth, without authority or "permission of the Lord President;" it kindles no suspicious motive that the Prince Consort's memory would be submerged by other interests. It was meant as a hint to guide our artists, not as a manacle to bind them. It tends to expand rather than to limit their conceptions; it is exclusive only in keeping all extraneous, selfish, and party predilections from sully with private schemes the purity of motive and the hearty earnestness which are the corner stones upon which the "Albert Monument" ought to rest.

SALISBURY CATHEDRAL.

WORKMEN have been busily engaged for some days past in erecting a scaffolding between the four piers which support the tower and spire of Salisbury Cathedral, for the purpose of enabling Mr. G. G. Scott to thoroughly examine the several parts of the structure in order to ascertain the best means of repairing and strengthening it. It appears from a recent order of her Majesty in Council, ratifying a scheme for the transfer of certain estates belonging to the Dean and Chapter of Salisbury to the Ecclesiastical Commissioners for England, that by reason of the great antiquity of the cathedral, and of the want of due reparation in times past, it has become necessary to expend thereon in repairs and in effecting improvements conducive to the security of the fabric, a sum of money amounting to £10,000 or thereabouts, and that this sum, together with interest thereon at the rate of £3 per cent. per annum from September, 1860, is forthwith to be provided and expended by the Commissioners in effecting such repairs and improvements, under the superintendence of and according to plans and specifications to be prepared by the architect of the said Dean and Chapter, as may be deemed necessary. It may not be generally known that the spire has for years past been some 22 inches out of perpendicular. The tower and spire, it will be remembered, were not a part of the design when the edifice was first built. It is thought that their erection was the "improvement" for which the materials of Old Sarum were used by virtue of letters patent granted by Edward III. to Bishop Wyvil and the Dean and Chapter in 1331.

SUGGESTED PATENT MUSEUM AND LIBRARY.—According to the report of the Commissioners of Patents the fees collected by that office gives a surplus of income over expenditure amounting to £20,000 per annum. The Commissioners recommend that that surplus should be applied for the benefit of patentees, by erecting a patent office, with a museum and library attached.

THE DEEPEST MINES IN ENGLAND.—The *Mining Journal* says:—The deepest mines in England are the Astley Deep Pits, near Dukinfield, which are 686½ yards in perpendicular depth.

SADLER'S WELLS THEATRE.—The fifty years' lease of Sadler's Wells Theatre and the site on which it stands has been put up at public auction. The particulars stated that it is subject to a ground-rent of £277 per annum; and is let to Mr. Phelps for £1,000 a year for seven years, from Ladyday, 1860.

* Since this was written we have received a letter from J. C. almost to the same effect.

ON THE ESSENTIALS OF A HEALTHY DWELLING AND THE EXTENSION OF ITS BENEFITS TO THE LABORING POPULATION.*

The second branch of my subject—the extension of the benefits of a healthy dwelling to the laboring population—now demands our attention.

The numerous discussions bearing on this question which have taken place in Parliament, in the daily papers, as well as in other periodicals and pamphlets, might lead to the supposition that its importance is now duly estimated by the public; but those who have sounded the depth and scanned the wide-spread extent of the evil to be remedied well know that such is not the case, and have too often seen the responsibility of contributing to its removal ignored by those who ought to feel its weight; whilst in some deeply to be regretted instances the want of a due estimate of the difficulties to be overcome, and of the requisite practical knowledge, has led to the pursuit of measures which, owing to their non-remunerative pecuniary results, have tended seriously to retard the progress of a movement, practically commenced eighteen years since.

The pecuniary features of the question are of such vital importance, from their necessary bearing on the adequate extension of the work, that I cannot here omit the expression of my belief that if the actual expenditure in providing improved dwellings for the laboring classes in towns had more generally been managed with such discretion as to yield the very moderate return of 4 per cent. or even of 3½ per cent., after the payment of all expenses and the providing a sinking fund for the repayment of the money laid out, there would have been no difficulty in obtaining from philanthropic capitalists an amount sufficient for building a very large number of improved dwellings, and in evidence that such a return is obtainable numerous examples might be instanced of that and a higher rate of interest on the outlay having been regularly obtained. Whilst some of these will be noticed hereafter, I think it right to remark, in reference to certain exceptional cases, that due allowance should be made for the difficulties and extra expenses attendant on most new undertakings, as well as for the experimental nature of some of the establishments in which the accommodation provided has been of a very mixed character. The results in those instances showing, I believe, invariably, that new houses for families yield a better return on the outlay than lodging houses for single persons, a purpose to which, however, old buildings have been adapted with very satisfactory pecuniary results.

Speculative builders, or those who are merely seeking what is usually called a good investment, would not, of course, consider 4 per cent. a sufficiently remunerative return; but I confess to feeling some surprise that, amongst the many who have accumulated large fortunes in connexion with the building trade in the metropolis, I know of only one firm, that of Messrs. Newson and Son, having so invested a part of the gains derived, in a large measure, from the labor of the working classes. It may, however, be owing to my limited means of information in this respect that I am unable to name other instances in the metropolis, though in Edinburgh several such examples were lately pointed out to me, which I could not but regard with peculiar interest and as well worthy of imitation. Some notice of these buildings is given in my report made at the Glasgow meeting for the promotion of social science. I have also seen with pleasure, in a very useful monthly paper, the *British Workman*, which circulates extensively amongst that class of readers, a view and brief notice of a village near Lowestoft rebuilt by Sir Morton Peto, which is described as one of the most picturesque villages in the kingdom.

Architects have sometimes been reproached for a want of interest and for exercising so little influence in regard to the improvement of the dwellings of the laboring classes. Knowing, as I well do, how rarely the members of the profession have to do with buildings of this class, such a charge is to me only one amongst many other proofs of the prevailing ignorance with regard to the measures and machinery best adapted to remedy the evil in question, and which I shall endeavour, as far as my ability and experience enable me, to point out, unbiassed by any interest whatever, and only actuated by the earnest desire of contributing to an object which I believe is most intimately connected with the physical, the moral, and the religious improvement of the masses of our population.

The measures for effecting this much-needed reform may be classified under three heads:—

1. Those of a legislative character, and those for which the Executive Government are responsible.
2. Those which ought to be adopted by landowners and employers generally for the benefit of their dependants, whether as tenants or workpeople constantly employed by them.
3. Those which originate from benevolent motives, and are undertaken either by associations or by individuals in order to aid in helping themselves those who need such aid.

In noticing successively these three classes of measures, some illustrative facts will be stated, which are partially the results of observations made during a residence of nearly five years on the Continent for the recovery of health. Some of the investigations then made lead me to remark, in reference to the first class of measures, that a jealous respect for the rights of persons and property, which is our security for many of the inestimable advantages enjoyed under a free government, has a manifest tendency to impede the carrying out of such public improvements as those which, under arbitrary rule, have been effected with unprecedented rapidity, on so gigantic a scale, in the metropolis of a neighboring country. What I think, in our own metropolis, we have a right to complain of, and ought to feel ashamed at, is the bungling and pettifogging manner in which many of our new streets have been formed, and fine opportunities for obtaining magnificent effects irrecoverably lost. It would be invidious to point them out; they will readily suggest themselves to you.

Time will not allow me to dwell on the important bearing which the formation of new streets has on my subject, or many facts which have come under my own observation might be stated, particularly some with regard to that great financial failure, Victoria-street, where several fruitless attempts were made to obtain from the managers, on reasonable terms, back land, as sites for dwellings suited to the displaced population, who, as a necessary consequence of the clearance which had been made, were huddled together in a frightful degree. This is but one example of what has so frequently taken place elsewhere in our own metropolis, owing to the want of a compulsory provision for the displaced poor. The same neglect on the part of the Government was the cause of an incalculable amount of suffering in Paris, when the

people who tenanted its narrow and winding streets were forcibly ejected, and often their few articles of furniture placed on the pavé, they themselves not knowing where to seek shelter. I visited more than once, in the spring of 1858, a kind of encampment of 600 such families, formed not far from the *Barrière de l'Etoile*, and heard from some of them their pitiable tale, and the exorbitant rent they were paying for temporary hovels, which the police had warned them would be pulled down in three months, and they forced again to go, they knew not whither. From a sense of duty, and encouraged by the fact of the Emperor having caused the paper which I read before the Institute in 1850 to be translated and widely circulated in France, I thought it right to bring this subject under his Majesty's personal consideration, in a memorial, which was graciously received, and, I hope, has not been altogether fruitless.

Our own legislative measures tending to give to the laboring population the benefits of a healthy dwelling, only comprised, when I addressed the Institute twelve years since, the passing of the Public Health Act, and the Nuisance Removal and Diseases Prevention Acts. Since then several measures, the necessity for which was dwelt upon in my paper, have been adopted, such as the removal of the tax on windows and on bricks, for both of which we are indebted to the Administration under Lord John, now the Earl Russell; the regulation of common lodging-houses (one of the most, amongst the many, valuable efforts of Lord Shaftesbury in this cause); the empowering, under the Laborers' Dwelling Act, the formation and general management of independent local associations, formed for providing improved dwellings, on the principle of joint-stock companies, with limited liability. Other bills have been passed for facilitating the construction of improved laborers' dwellings and cottages in Scotland and in Ireland; but, during the last session, a bill which would have given to English landowners, tenants in tail, the power of raising money for building improved cottages on their estates, very similar to that already granted in Scotland, was, after it had passed the House of Commons with but little opposition, rejected by a majority of 16 to 13 in the House of Lords, at the close of a debate which had at least the appearance of showing how much less real interest is taken in this question than might have been inferred from several debates, at the opening of the session, relative to the destruction of laborers' dwellings, consequent on the introduction of railways to the centre of the metropolis. Those debates led to the insertion of clauses in some of the railway bills obliging the companies to provide certain cheap trains, at hours suitable for the conveyance of working people, to and from the precincts of their residences out of town. A standing order, intended to apply to cases in which Parliament granted power to pull down houses occupied by the working population, was passed by the House of Lords in 1853, at the instigation of the Earl of Shaftesbury, but, as far as practical results, it had become a dead letter.

That further legislative interference is indispensable to the remedying existing evils might be proved by abundant evidence. Excepting within the City of London,* and in the case of common lodging-houses, no power has yet been granted effectually to check the evil of overcrowding, in regard to which the Medical Officer of Health in the city of London thus speaks:—"Without doubt it is the worst of all the unwholesome influences with which you have to deal; and until it is corrected you will never be secure from those outbursts of disease which appear to set your sanitary measures at defiance." A report made by the Assistant-Commissioner of Police on the condition of single rooms occupied by families in the metropolis, without the precincts of the city authorities, after giving in detail about forty most painfully disgusting examples of overcrowding, says:—"It is evident from these cases, which might be greatly multiplied, that all the evils which the Acts for regulating common lodging-houses were intended to remedy still exist, almost without abatement, in single rooms occupied by families, single rooms so occupied being exempt from the operation of the Act." The causes are the avarice of owners and the poverty or debasement of occupants, and the only hope of improvement seems to be in some legislative enactment.

In regard to the overcrowding of cottages in country districts, I might remind you of the numerous letters on that subject which not long since appeared in the *Times*, and were but the echo of what has been said and proved so often elsewhere. It was with a view to obtain reliable statistical returns on this important subject that the then Secretary of State for the Home Department was memorialised eighteen months since, and urged by a deputation from the Council of the National Association for Social Science, to take advantage of the recent Census for this purpose; but, notwithstanding the unobjectionable character of the inquiry, and the ease with which it could be made, were fully admitted, the application proved fruitless.

After all that has been done within the past fifteen years by many proprietors in providing improved cottages on their estates, there are yet numbers who need to be made aware of facts which exist on their own property,† and there is reason to fear that, with regard to others, their obligations must be pressed home in such a way as they doubtless would be were the Registrar-General enabled to instance flagrant cases of neglect, and to show what the results are by unquestionable facts. I cannot help, therefore, regarding the loss of this opportunity as a matter for very serious regret, especially when it is remembered how little the Government can do directly towards the domiciliary reform, so greatly needed amongst the masses of the population.

By legislative enactments can alone be prevented the recurrence of those hardships and other great evils which have arisen out of the selfish system pursued in some "close parishes," where cottages have been pulled down in order to obtain relief from a burthen which is thereby thrown upon a neighboring parish, regardless of the sufferings endured by the laborer, who is often, as a consequence, compelled to walk several miles to and from his work. A calculation of the positive loss from the waste of valuable time and strength thus expended was made by the late Sir Robert Peel; and yet, how many who have laborers in their constant employ need to be convinced that it is as much their interest to care for them in regard to their dwellings, as it is to provide well situated, healthy, and convenient stables for their cattle?

The only other legislative measure which I shall point out as being especially:

* The power referred to was conferred in 1851, and under the supervision of the able medical officer of health it is exercised with great benefit to the poor, as a diminution in the returns of mortality from 25 to 23 in 1,000, traceable to this and other sanitary measures, abundantly prove.

† A system of registration of the actual condition and extent of accommodation in existing cottages has been suggested by Dr. H. Acland, of Oxford, which, if generally adopted by proprietors, would, doubtless, elicit some very startling facts. Mr. Parker, of Oxford, will supply these forms of registration on the receipt of a postage-stamp.

needed, is one that would operate generally to prevent the building of small houses on undrained ground, and without proper sanitary arrangements; such a fruitful source of sickness and consequent expense to the public ought, without doubt, to be entirely interdicted. It is an evil, the extent or the magnitude of which, it would be difficult to estimate with accuracy.

As bearing on this, and several other points which have been referred to, I may quote the words used two years since by a right hon. gentleman, the present First Commissioner of Works—"As yet the necessity of protecting life from the influence of poisonous dwellings has not practically been acknowledged, though the principle is in the statute book."

It is unnecessary to occupy your time at any length with what has been done for the object under consideration by the Governments of other countries; that of Belgium has been aided therein by the zealous efforts of M. Duquetiaux, and in numerous other instances our example has been attentively watched, if not followed. In some of them the pleasure has been afforded me of tracing the results of my own labors in this cause, abroad as well as at home, rendered in the former case mainly through personal intercourse and the circulation of translated papers.

2. In noticing the measures which ought to be adopted by *landowners and employers generally* for the benefit of their dependents, such as tenants, or workpeople in their constant employ, I feel that a quotation from the letter of the late Duke of Bedford, given at length in my former paper, is the best reply which can be made to the excuses of many for their neglect of duty in this respect—"Cottage building, except to a cottage speculator, who exacts immoderate rents for scanty and defective habitations, is, we all know, a bad investment of money; but this is not the light in which such a subject should be viewed by landlords, from whom it is surely not too much to expect that whilst they are building and improving farm houses, homesteads, and cattle sheds, they will also build and improve dwellings for their laborers in sufficient number to meet the improved and improving cultivation of the land. To improve the dwellings of the laboring classes, and afford them the means of greater cleanliness, health, and comfort in their own homes; to extend education, and thus raise the social and moral habits of those most valuable members of the community, are among the first duties, and ought to be among the truest pleasures, of every landlord."

The example which was set by his Grace in the building and improving the cottages on his estates in seven different counties involved, in the course of eight or ten years, an outlay of about £70,000. Another instance of princely expenditure on the same object is that of the Duke of Northumberland, which has been estimated at £100,000. The average cost of the cottages built by these two noblemen may be stated at from £90 to £120 each.

The question of a *remunerative return* on the outlay in building cottages in agricultural districts is one which impinges so closely on that of the rate of wages, that I shall not venture on its discussion. It would be hopeless to argue this point with those who think that wages of 8s. to 9s. per week can properly maintain a working man and his family, as well as pay the rent of a healthy dwelling. With the greatly increased prosperity of agriculture, such a rate of wages appears to me unaccountable, and altogether at variance with equity and sound policy.

The efforts made by some of our great manufacturers for the benefit of their workpeople have been in proportion to those just noticed. Many owners of mines, quarries, and works of various kinds, can bear testimony to the great benefits resulting from their expenditure in providing proper dwellings for the people in their employ.

The same has been the case with reference to the cottages built in considerable numbers by several of the leading railway companies.* The secretaries of some of them, in speaking on the subject, have referred particularly to the great advantage of having the men ready at hand, in case of need, and removed from the temptation presented by public houses. Government has acted on the same principle in regard to the Police force, and, taking the idea originally from the model lodging-houses, barracks have been built, generally for those of them who are unmarried—a good precedent, which might, doubtless, be adopted in many other instances with much advantage to both employers and employed. In such cases a sufficiently remunerative rent can generally be charged, and its payment guaranteed by a deduction from the wages.

On the Continent, our example has in this respect been much followed. At the Paris Exhibition, 1855, there were many views of workmen's dwellings erected by their employers. In two of them particularly, the leading features of the Prince Consort's Exhibition Model Houses were strongly marked. One, constructed in 1853, at Bourges, provides accommodation for four families on the ground floor, and for twenty single men on the upper floor. The other is that of the Cité Ouvrière des Verriers, at Escautpont, near Valenciennes, which comprises, in a central building, schools and other apartments used in common, with some of the dwelling-houses, but the latter are chiefly contained in two detached blocks, forming the sides of a hollow square. In these buildings the frequent repetition of recessed entrances, with galleries to the upper floor, is, from the contrast of light and shade, productive of a novel and good effect.

I have visited dwellings for workpeople built by their employers in Brussels, at Liege, and also at Mulhouse, one of the chief manufacturing places in France, where the idea of constructing a Cité Ouvrière originated in the receipt of a translation of my former lecture, sent by order of the Emperor. It was commenced in 1853 by an association of manufacturers, headed by M. Jean Dollfus, on a scale more extensive and complete than that of any similar establishment in France. A spacious road, planted on either side, runs between the main groups of cottages, and parallel roads run behind them. The houses are chiefly arranged in detached blocks of four dwellings each, placed in the centre of a square plot of garden ground, which is divided equally between the tenants; two of these dwellings front the main central road, and two the minor or back road—an economical arrangement in regard to cost of construction, and one which admits of good internal ventilation, though not as perfect as when houses are built in pairs. The dwellings, though not precisely uniform in their disposition, have mostly a wide entrance, fitted up with a cooking-stove and sink; beyond is a staircase, leading to three bed-rooms and a closet. The remainder of the ground floor is devoted to the living-room, with a large recess behind the staircase of sufficient dimensions to contain a full-sized bed; this compartment has a side window, and, in some cases, being partitioned off from the living-room, it forms a small separate room. There are, besides these, several rows of double houses, built back to back, each having a narrow strip of garden-ground; their arrangement cannot be commended as consistent with good

ventilation, and the general appearance of the tenants indicated a decidedly inferior class of occupants, with want of cleanliness and propriety. In the summer of 1860 there were completed 480 houses, two-thirds of which had been sold to the occupiers, and 90 more were in the course of construction, land having been bought for 800 in the whole. Baths, a wash-house, and a bake-house, as well as a public kitchen and *restaurant*, conducted by a Société Alimentaire, were opened when I visited the cité in 1856; since which have been added a reading-room, a school, a lodging-house for unmarried men, and one for men on the tramp.

The outlay on the roads, fencing and planting, was defrayed out of a Government subvention of 300,000 francs, or £12,000; being a part of 10,000,000 francs appropriated to such purposes by the Emperor, with a view to stimulate the work in France. The tenants have the option of purchasing the houses by the gradual payment of their cost price, which ranges from £72 to £120 each, and two-thirds of them have done so, to the very marked benefit of themselves and families, and with the further good result of providing the funds necessary for continuing the buildings, without increase of capital on the part of the projectors, to whom, as well as to M. Emile Muller, of Paris, from whose plans and under whose direction they were built, the greatest credit is due.

I have thought that these details may be useful, and, perhaps, suggestive, with reference to schemes often projected for building workmen's dwellings in large numbers out of our own metropolis, with a view to their occupants being conveyed to and from by cheap railway trains. With the same object I notice having seen near Paris an entire village, then all but completed, which had been built by a Parisian tailor for his workpeople. It comprises wooden houses, or chalets, for 76 families, 28 intended for single, and 48 for groups of families, each occupying a separate tenement, and having two, three, or four rooms. There are two spacious workshops, and although some defects might easily be pointed out, an air of neatness and order gives the whole a very pleasing effect. Here the work, which is sold in the very heart of the city, and has hitherto been done by workmen residing with their families in miserable, unhealthy, and, at the same time, high-rented dwellings, will be done under the advantage of abundant light and pure air, greatly to the advantage of the consumer, the employer, and the employed, as well as of the pockets of those who have generally to bear the burden of supporting the working man and his dependents in case of sickness.

It would be easy for me to illustrate by many other examples, at home and abroad, the practical recognition by those who have working people in their regular and exclusive employ, of an obligation to see that they are properly housed, and, at the same time, to show the benefits resulting therefrom to both parties. But other measures have yet to be noticed, which will be grouped under the last head, viz.—

3. Those which originate from benevolent motives, and are undertaken either by Associations or by individuals, in order to aid in helping themselves those who need such aid. My former paper recited the establishment by philanthropic individuals of two associations, one of which commenced in 1844 and the other in 1845, the building of improved or model dwellings for the working classes in the Metropolis. Highly beneficial as these societies have unquestionably been in the pioneering work of this movement, experience has, in regard to one of them, confirmed the opinion I held when undertaking, in 1844, the duties of its honorary architect, that it should aim at doing a little and doing it well, so as to be in deed, and not in name only, a model society, rather than attempt more than from its constitution it could be reasonably expected to accomplish, with such results as would commend it for imitation. The society to which I refer is that for Improving the Condition of the Laboring Classes, which has constructed under my direction four distinct ranges of new buildings, accommodating 97 families in separate dwellings, and providing 94 rooms for single women, as well as lodgings for 104 single men, and a public wash-house with baths. Whilst in three distinct localities, old houses were renovated and fitted to provide lodging for 158 single men. The expenditure on these several dwellings and lodging-houses has been £36,405 15s. 11d., and they have all been in full occupation since 1851.* Subsequent to 1853, when I went on the Continent, three entire courts in different localities were taken, and the condition of the houses, which, in two of them, were indescribably filthy, and occupied by the lowest class of tenants, was completely changed. The number of rooms collectively contained in these courts is 275, and there is also a single men's lodging-house with 40 beds. The total outlay on these three courts has been £7,226 1s. 4d., and the net return for the year 1859, after deducting all expenses and repairs, was £249 18s. 11d., or 3½ per cent.; whilst from the Society's new building in

* The receipts and expenses of the different buildings, exclusive of that in Portpool-lane, during the year 1852, for which I can personally speak to the management of this Society, having then acted on its Committee and as its honorary architect, were:—

Bagnigge-wells: self-contained houses and flats for 23 families, and rooms for 30 aged females. Outlay on land £1,045; building, £5,325.	Receipts	£375 7 7
	Expenses	82 6 9
	Net return	293 1 0
Streatham-street: houses for 54 families built on flats, fire-proof, and with galleries. Outlay, ground-rent, £50; building, £8,916 16s.	Receipts	724 7 4
	Expenses	224 18 1
	Net return	499 9 3
George-street: lodging-house for 104 men, six stories high, including basement offices, and four floors of dormitories. Outlay, land, £1,200; building, £5,226.	Receipts	618 11 4
	Expenses	366 6 2
	Net return	252 5 2
Charles-street: lodging-house for 84 men formed out of three, old houses, renovated and thrown into one. Outlay on repairs and furniture, £1,163 14s. 2d.	Receipts	418 0 4
	Expenses	233 5 2
	Net return	184 15 2
King-street: lodging-house for 22 men. An old house, on the repairing and furnishing of which £135 was expended.	Receipts	111 9 8
	Expenses	73 13 11
	Net return	37 15 9

The rents received from these houses have varied but slightly since they were opened up to the present time, and they are generally well filled, the families changing but seldom. The cost of repairs is not included in the expenses above stated; they should be taken as averaging ½ per cent. on new, and generally from 1 to 2 per cent. on old buildings.

† This return, though a considerable increase on that of the previous year, is not encouraging, the property being old and leasehold, and no provision for a sinking fund having been made.

* The Great Northern has built 150 cottages at their station, near Peterborough, and the Brighton Company has built and acquired nearly 400 cottages for their men.

Streatham-street for 54 families, where the expenditure was £8,916 10s., the corresponding net return for the same year was £420 18s. 8d., or 4½ per cent. on the outlay, and from the model lodging-house for men in George-street, St. Giles's, the return was 4 per cent. on the outlay, and had been 4½ per cent.

The Metropolitan Association for Improving the Dwellings of the Industrious Classes, which is the other Society referred to, had, up to 1860, expended on its ten distinct ranges of dwellings £89,613 14s. 10d., of which £71,322 2s. 6d. was laid out on six separate blocks of dwellings in different parts of the metropolis, accommodating 305 families; the net return from these buildings for the year ending 31st March, 1860, after deducting all current expenses and repairs, amounted to £2,687 4s. 4d., being about 3½ per cent. on the outlay.

On two lodging-houses for single men—one of them new, which has accommodation for 234, and the other old, which provides for 128—the return, owing to the want of sufficient occupants, has been very unsatisfactory; involving, indeed, a considerable loss, which proves that the buildings are either too large, or in some way unadapted to the class of men frequenting their neighbourhood.

It is worthy of observation that the same result has attended a similar lodging-house which I have seen at Marseilles, built outside the town, for 150 men, too far from their daily occupation; whilst many such houses elsewhere, on a smaller scale, accommodating from 50 to 100 men, and near to their work, have fully succeeded; in some instances they have been gradually increased, which is the case at Leeds and in Liverpool. Of two adjoining houses, built on the Boulevard de Batignolles, in Paris, to accommodate together 203 men, and having on the ground floor a restaurant and café, one was closed three years since. In this instance, however, the failure is, doubtless, in some degree attributable to defective management.

From the experience of these two Societies in the metropolis, it would appear that old buildings may be renovated and fitted up for men's lodging-houses, with the prospect of, at least, a fairly remunerative return on the outlay; for in the instance of Charles-street lodging-house, it has averaged from 12 to 15 per cent., though, in some other instances, the return has been under 5 per cent. Whilst the putting of old courts and blocks of dwelling-houses for families into a good sanitary condition, unless they are obtained at an unusually low price, is not likely to yield a satisfactory return on the outlay, at all events, if done by societies and taking 4 to 5 per cent. as the lowest rate of interest which such investments ought to yield, after provision has been made for repairs,* and a sinking fund to pay off the capital, which it is obvious there should be, especially in the case of leasehold property.

Highly valuable as must be the results of the transformation effected in two of the courts referred to, where filthy dens became decent and healthy dwellings, the actual benefit arising out of these efforts was not conferred to the extent which might be supposed on those who were the occupants of the courts when they were taken by the Society; a considerable portion of them having been ejected in order not only to reduce the number of occupants within a due limit, but also to secure a more eligible set of tenants. My own conviction is very decided that the owners of such property should be compelled by the law either to put it into a healthy condition, to close it altogether, or to part with it at its fairly ascertained value to those who may be willing to undertake the necessary outlay. At present, the fact of such property being inquired for by philanthropic persons gives to it a fictitious value; and in numerous instances within my own experience, the object has thus been defeated, or the price paid for the property has been so high that, with the outlay on repairs, its net return is such as to discourage any further attempts of the same kind. An Act of Parliament passed in 1855, applicable only to Scotland, contains a clause which, in a certain degree, meets such cases; but it appears to me that the principle involved in the entire prohibition of the sale of articles of food, when in an unwholesome condition, applies, with undoubted equity, to dwellings, and that it is the only way of effectually remedying the evil.†

PROFESSOR SMIRKE'S LECTURES ON ARCHITECTURE AT THE ROYAL ACADEMY.—LECTURE II.‡

I MUST not pursue this subject further than just again to remind you of the æsthetic advantages afforded by the old mode of treating the chimney hearth. The contemptible little pinched-up compositions of thin, flat, marble slabs which now usually decorate this social centre of domestic hospitality, contrast most painfully with the large and generous treatment of the fireplace, and with the sculpture and painting which were lavished, during the period to which I am alluding, on this place of honor in the halls of former days.

Although time has left us but few illustrative examples of these fireplaces in England, we have but to visit Nuremberg, or any of the older cities of the Netherlands, to find noble examples still surviving the wreck of time. Even the great hall in the Hotel de Ville, in Paris, probably familiar to you all, which is of the time, probably, of Francis I., affords a most remarkable example, sufficient to dwarf down into insignificance every similar object I have met with in England, although I am aware there are examples of the time of Henry VIII., of Elizabeth, and of Charles I., of no mean character.

At the magnificent Châteaux of Blois and of Gaillon, the most remarkable features are their gardens; they are, of course, laid out in the formal artificial manner usual in the gardens of the early period to which these examples belong. In the centre of both these gardens is a fountain of much elegance of design, although the jets of water issue from sources not altogether unobjectionable. The practice of throwing the water from the mouths of human masks cannot be defended, although it is a very common expedient. It was suggested probably by the gargoyles of medieval times, when monsters, often of the most preposterous design, were made to emit water both in fountains and at the eaves of roofs; but these also may claim a far more ancient origin. We know how commonly the rain water which fell on the roofs of Greek temples were made to issue from the mouths of lions carved on the cyma of the cornice; they were, in fact, the true gargoyles of the Greeks. The practice may, perhaps, be partly due to æsthetic causes, for there are few subjects more captivating to the sculptor than the lion's head, so admirably sculptural in the breadth and even in the grandeur of its details. But still another and remoter origin may be assigned to the practice. The overflowing of the Nile, which, as you know, annually renews that arid country, and gives occasion to so much periodical rejoicing, occurs when the sun is in Leo, a coincidence quite sufficient to lead the Egyptians to adopt the lion's mouth as the source from whence their liquid treasures were made to issue.

At the fountains of the Château d'Anet jets of water are seen issuing from Diana's bow, and from the horns of her accompanying stag. I am, indeed, bound to admit that the rude artists of this not highly polished nor very fastidious age caused jets to flow from still more exceptional, although, perhaps, more natural sources.

These devices are common enough at the period of which we are speaking, and can only be excused on the ground of the extreme difficulty (which all must have felt who have

tried their hands at designing fountains) of devising any perfectly unobjectionable, and yet ornamental mode of emitting the water. But, perhaps, the most notable feature in these early French gardens is the arcade, or covered way, which encloses the whole area. As a gallery offering a sheltered walk at all seasons of the year, whether too hot or too wet for out-of-doors exercise, these covered walks must always have been a welcome refuge. The luxury was probably borrowed from the Italians, with whom these arcades or colonnades had already become a favorite adjunct to the villa. They, also, in their turn, may claim a classic origin. Those who have read Pliny's description of his Villa Laurentina will remember how he dwells on the crypto porticus as one of the luxuries of his favorite retreat—a luxury which, though preserved in the cloisters of the middle ages, seems to have been, without good reason, overlooked and neglected in modern gardening.

In these French gardens I also perceive indications of the pergola, or trellised walk, which forms so elegant as well as so commodious a part of almost every well appointed Italian garden.

I will not further detain you by dwelling on the other beautiful châteaux represented in these volumes, although they present to us most attractive objects, such as Château Chenevont, one of the most theatrically picturesque buildings that can be imagined; Château Chantilly, perfectly medieval in its general design, although in its details showing strongly of the more modern style that Catherine de Medicis encouraged, and had, in fact, introduced into France; Château d'Anet, less Gothic, but equally varied, original, and picturesque.

Such are the contents of these curious and valuable volumes. A careful and critical examination of them will satisfy any impartial mind that they take a very narrow view of the subject who fancy that all architecture necessarily divides itself into the Classic and the Gothic schools, and that, therefore, if we reject the one we must necessarily adopt the other. Such, happily, is by no means the case. I have on a former occasion endeavored to show that such was not the case when the quattrocentists of Italy put away Medievalism in art with the casque and gauntlet which they had outgrown. They were too good artists and too sensible men not to perceive that modern civilisation required something more than a return to columns and pediments, and they accordingly struck out a style of design perfectly original, and in many respects more beautiful than anything that had preceded it.

In the same way we find that when, a little later, the artistic and inventive genius of France was directed to the production of designs in the renaissance style, it never occurred to their fertile minds that it was incumbent on them to plunge into a purblind system of copying the works of former times. On the contrary, we see in these buildings of the time of Catherine that a style of great beauty and force was possible, which yet was equally remote both from Greek and Gothic. True art is ever young and productive; it needs only adequate incentives and encouragement to warm it into life. A well stored portfolio of photographs would turn any man, however uneducated in art, into an architect, if the careful repetition of old forms be all that is required of him.

As I have devoted this evening to looking into a few books, I must be excused if in closing one volume and opening another I find myself following a somewhat desultory course. It does not, however, appear to me to be necessary to observe any especial historical sequence. The book which next comes to hand is a splendid volume, of earlier date than that to which we last adverted, and is not without a certain amount of romance in its history, for it consists of verses composed by the Duke of Orleans after his capture at the battle of Agincourt, and with which composition he beguiled the tedium of his imprisonment in England. The illustrations are beautifully executed miniatures, and of great interest as explanatory of the buildings, habits and costume of the period. One of these illustrations is of especial interest, as it presents a view of London in the fifteenth century. It is taken on the banks of the Thames, and represents the Tower in the foreground and the bridge in the middle distance. The very rapid shoot of the current at the bridge is plainly indicated. At a short distance from the Tower is seen the creek of "Bellyne's gate," on the banks of which creek and below bridge is a considerable building, probably the custom-house. The architecture of this building is portrayed with great minuteness, and is manifestly drawn from the actual objects—not conventionally, but with considerable effort at correctness of representation. It is worthy of observation that the lowest story consists of an arcade of perfectly Renaissance character, the arches being circular, or nearly so, springing from ordinary columns apparently very much like Roman Doric.

The superstructure, however, is of quite medieval character, presenting a series of steep gables of dissimilar designs, and with the windows apparently mullioned. The perfectly Italian aspect of the lower part of the building seems to me to be conclusive evidence of the existence of the style of the Renaissance in England very much earlier than is usually supposed.

The Porta Honoris at Cambridge is generally pointed to as one of the earliest, if not the earliest, example in England of the quasi-classic style. This gateway, however, must be nearly 150 years later than the building near old London-bridge, so carefully delineated in this illumination.

Now that I am touching on the subject of illustrated manuscripts, I need not omit allusion to the remarkable book known as the "Codex Aureus." It forms part of the Royal Library collected by George III., and is certainly one of the gems of that collection; it has many claims on our attention, inasmuch as it appears to be beyond a doubt that it was executed for Charlemagne; it is enriched with magnificent illustrations, which may be fairly presumed to be specimens of the highest art which Europe in the beginning of the ninth century was capable of producing, and is, moreover, considering its great age, in excellent preservation. The prevailing character of the architectural features is manifestly what it is usual to designate as Romanesque. Each page represents one arch, divided into three subordinate compartments by slender pillars carrying three arches. This arrangement of arches seems to have taken its rise somewhere about the period in the history of architecture with which this volume is contemporaneous; perhaps, indeed, even earlier.

The practice of building small arches in a continuous series, springing from the capitals of small pillars, bears a far earlier date. We find them in abundance at the Palace of Diocletian. Such small arcades occur, too, at the building near Ravenna, called Theodoric's Palace, and a continuous range of them originally encircled the multangular tomb of that monarch. These small arcades, arranged in successive, superimposed orders, came to be used to excess, as you, no doubt, well know, and covered the towers and gables of the Lombardic and subsequent ages. I may add that in paintings and mosaics of so early a date as the fourth century, represented in Seroux d'Agincourt's great work, these arcades abound.

But in the illustrations of a manuscript preserved in the Laurentian Library, at Florence, to which the date of the fourth century is assigned, a more distinct foreshadowing occurs of the Gothic mullioned window. It represents a large semicircular arch, comprising within its span four minor arches, thus dividing it into four narrow openings. It is true, the head of the large comprising arch is blanked; there is shown on it a circle, probably decorative only, and not perforated; but the transition from this to an ordinary four-light Gothic window is easy and natural. In the "Codex Aureus" to which I have been referring, we have very plainly this germ of the Gothic window; and we have it even more distinctly developed in MSS. of the ninth century, of which representations are given by D'Agincourt. But not only were these small arcades the putative parents of mullioned windows, to them, also, it can hardly be doubted, we owe the triforium of our Ecclesiastical architecture. I cannot refrain from here reminding you of the analogous use of these subordinate arcades in the Westminster Hall, as built by our William Rufus. In the twenty-sixth volume of the "Archæologia" you will find the representation of that triforium story forming an open arcade passage-way, obtained in the thickness of the wall. This curious feature in the domestic architecture of the twelfth century I had the pleasure of being the first to explore and delineate, when the interior of the walls of Westminster Hall was opened out and exposed to view, under my brother, Sir Robert's, directions, with a view to the refacement of the masonry of those walls in 1837.

I have, perhaps, detained you too long in thus tracing the pedigree of these mural arcades, but they are of some importance in the history of architecture. It may be difficult to point to any feature more strongly characteristic of Medieval architecture, or more definitely distinguishing it from strictly Classic art.

In the singular works of early Christian architecture, to which I have been alluding, it is impossible not at once to recognise a strong savour of Byzantine art. There is, for example, in the "Codex Aureus" an almost infinite variety of frets and friezes introduced of

* The average expenditure on repairs to new buildings should not exceed ½ per cent., and may often be less, whilst it would not be safe to calculate those required to old buildings at less than 2 per cent. on the average.

† To be continued.

‡ Concluded from page 70.

a quasi-Classical character, all most carefully and elaborately executed, and with a manual dexterity and precision which seem to imply great practice in such works. The Greek labyrinth fret occurs in utmost variety, and those interlacing patterns that stamp a peculiar character on the art of ornamental design in this Byzantine style occur in these illuminations in utmost profusion. Whether accompanying Runic inscriptions in Ireland, in Norway, or elsewhere, or whether seen carved in stone in the earliest Christian buildings of Lombardy, or worked in mosaic on the walls of Greek churches, or depicted upon vellum in these beautiful manuscripts now under our consideration, there is a similarity of design and a general agreement in the manner of treatment which is certainly well worthy of observation. What adds especial interest to this curious kind of ornament is that it was not, apparently, derived from or suggested by any similar ornament in the preceding Classic school. Could it have been traced back to ancient Rome, we should not have been surprised at its occurrence in localities so widely apart, and in styles of design so widely differing; but nothing, as far as I know, occurs in Roman art from whence these intricate interlacings could have been derived—unless, indeed, we may suppose that the *guilloche* was the parent of this ornament, which would, in that case, take back the idea to Athens itself, and to how much remoter a period I know not. Even Assyrian art is not without traces of it.

Whether so derived or whether it was the original product of a Teutonic or a Byzantine mind, certainly its wide prevalence is remarkable. It seems not unlikely that the facilities which these interlaced ornaments afforded of producing the device of a knot having no ends, would recommend it to the favor of the early Christian artists as an emblem of eternity, as well as of brotherhood. But whatever its origin, the idea was certainly most prolific. Besides being productive of a variety of mere ornaments, such as we see on this MS. of the time of Charlemagne, it suggested no doubt the monsters devouring their own tails, which we see so commonly portrayed in mediæval sculpture; and the true lovers' knots depicted in a thousand familiar, although unmeaning, shapes on our walls and ceilings down to the time of Elizabeth, and, for aught I know, to the present day.

Time warns me that I must not, this evening, introduce to your notice any more of the literary and artistic treasures stored up in our magnificent national collection. I am well aware of the very superficial nature of these few slight notices: they present to you but the faintest glimpse of the almost endless stores that the liberality of country has been enabled to accumulate under the guidance and with the assistance of her best scholars. In calling your attention to the few books which I have named, I am, I fear, subjecting myself to the sarcasm of the old Greek author who tells us of a certain "Scholasticos" who, being desirous of recommending a house to the favor of his friends, carried about with him a brick or two by way of specimen of the entire mansion. Yet scanty and very inadequate as the samples may be which I have this evening laid before you, I feel sanguine in the belief that my few remarks and criticisms will not have been made in vain, if they have produced in your mind a desire to seek for further satisfaction at the fountain heads; to consult them for yourselves, and to liberalise and enlarge your studies by a wider field of investigation.

A careful contemplative study of the causes of the almost awful sublimity of the Colosseum, for example, is calculated perhaps to encourage and even to generate a greatness of manner, and to elevate the artistic tendencies of the mind; and to teach us that the grandest effects in our art are far more readily attainable by simple general forms, than by resorting to that excessive elaboration and subdivision of details which (perhaps I may be permitted to say) is one of the least commendable tendencies of the present day, and against which it would be well that you should be on your guard.

Then, again, a critical examination of the interesting productions of the age of the Renaissance in France—an examination so greatly facilitated by the two beautiful volumes of Catherine de Medici, which I have been adverting to—is well calculated to fertilise the mind of a young architect, and to show to him how the combination of two very different kinds of beauty is capable, in the alchemy of genius, of being made to produce still another beauty—a *tertium quid*—differing very materially from its two components, yet partaking of the merits of both.

Such an examination would, furthermore, satisfy him that it was no mere love of innovation, no mere freak of fashion, that led our forefathers to lay aside in their architecture the stern and rigid air of mediævalism. They abandoned mullions and tracery in their windows, and made them wide and square and open—not in sport and for the sake of a frivolous change, but because they were beginning to learn to appreciate more fully the value of light and air, and because they began to perceive that there were other means of excluding an enemy and securing their personal safety and an inviolate hearth, besides loopholing and crenellating their dwellings. An inquiry into these great changes in their habits of building is a curious and not an unprofitable inquiry. It is common enough to hear it said that the revival of a taste for classical literature led to the study and subsequent adoption of classical architecture. Whereas the two revivals were, in truth, strictly contemporaneous; and it is by no means improbable that they may be regarded, not as one being consequent on the other, but that both were necessary results of a common cause—namely, the advance of civilisation, involving the acquirement of new habits and new wants.

The other volumes of which I have this evening made mention have an antiquarian rather than a practical value, and to that extent are, no doubt, less suitable subjects for me to urge on your attention here. Yet those manuscripts are samples of a great store of similar works which our national museum may be justly proud to possess, and which, whilst they are of the highest literary and historical value, must ever be precious also in the eyes of artists, inasmuch as the illuminations which adorn their pages represent faithfully the condition of the fine arts during the mediæval period, and are, as it were, the golden link that connected the ancient with the modern schools of Painting and Design.

ACCIDENTS ON FRENCH RAILWAYS.—We find the following in the *Revue Contemporaine*:—"On the Northern, Strasburg, Western, Orleans, and Mediterranean lines of railway, 2,130 trains run every day, and the distance performed is altogether 192,000 kilometres (five-eighths of a mile each), making a total of 777,450 trains, and more than 70,000,000 of kilometres in the year. The number of passengers conveyed on those lines in the years from 1850 to 1860 was about £310,000,000, and during that period the loss of life by accidents was 44, or one out of 7,000,000. Does there exist a human undertaking where material forces are used in the midst of difficult circumstances, and with the co-operation of such a considerable number of men, which would engage not to make a greater number of victims? The above figures, taken from official sources, have an eloquence which cannot be easily weakened, and against which affirmations too lightly brought cannot prevail. What additional force do not these calculations acquire when they are compared with the number of carriage accidents which take place in one year in the public thoroughfares of Paris alone? In 1860, for instance, the official statistics inform us that the casualties of that kind amounted to 929, which occasioned the death of 30 persons, and serious injuries to 579 others. Thus the circulation of carriages in Paris has led to almost as many violent deaths in one year as the circulation of the French railways in ten years."

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

WINDOW, SAN PIETRO MARTIRE, VERONA.

THE little chapel of San Pietro Martire, now used as a college, contains many architectural gems, one of which, a window-head, we have engraved. It is very simple, but none the less beautiful. The materials are brick and white marble. The section of the jamb is hardly more than a splay. The trefoil in the arch, cut out of a single block, is a charming bit of design, and gives a degree of richness of effect that five times the amount of carving would not necessarily procure for it. The height of the window is about 14 feet, and the width, as nearly as we can recollect, about 2 feet 6 inches. Adjoining it there is a circular window, designed with equal skill, and over the entrance is the well-known canopied tomb of G. da Castelbarco. The date of the window is the first half of the fourteenth century.

SOUTH PORCH OF ST. GUDULE, BRUSSELS.

DEDICATED originally to the Saints Michel and Gudule, this collegiate church is now better known as St. Gudule. It is situated on a rising ground once called Molenberg, and was founded in 1010. The choir and transepts were completed about 1270, the nave in the fourteenth century, and the western towers soon after 1500. Many alterations have, however, been effected since that time. The north and south windows of transept—the latter is shown in our illustration—date 1557. The precise date of the south porch is not recorded.

FIRES IN LONDON DURING THE PAST YEAR.

THE report of Mr. Shaw on fires in London during the past year gives the number of totally destroyed premises as 53, being 25 in excess of the same list for 1860, and 13 in excess of the average proportion for the 28 past years. Of the premises burned, 20 were from two to seven miles distant from the nearest station; 25 were used for the carrying on of hazardous trades, such as cabinet-makers, carpenters, hay and straw salesmen, steam saw-mills, &c. Three were completely on fire before the arrival of the engines, and of the remaining number, some through imperfect construction, and one (Cotton's wharf) from its great magnitude and inflammable contents, baffled all the efforts of the firemen.

The total number of calls received during the year was 1,409, of these 80 were false alarms, 137 proved to be only chimney alarms, and 1,183 were fires, of which 53 resulted in the total destruction of buildings, &c., 332 in considerable damage, and 798 in slight damage. The fires of 1861, compared with those of 1860, show an increase of 127, and compared with an average of the 28 years during which the establishment has been in existence, the increase is 391. This list does not include trifling damages by fire, not sufficiently important to require the attendance of firemen. Of these no record is anywhere kept, but they, it is considered, may be estimated in round numbers at 4,000; neither does it include the ordinary calls for chimneys on fire, which may be roughly estimated at 3,000.

With regard to the fire at London-bridge, which occurred on the 22nd of June last, and resulted in the almost total destruction of thirty-three buildings, there is every reason to believe that, but for a serious delay and deficiency of water, and some violent explosions which took place at the commencement, the fire would have been confined to the building in which it originated. In six of the cases mentioned in the totally destroyed list, the supply of water was either late or insufficient.

The land steam fire-engine continues to render valuable service. In this engine a great difficulty has hitherto been experienced in getting up steam in a sufficiently short space of time; this difficulty is now obviated by the introduction, inside the fire-box, of a small jet of gas, which keeps the water constantly boiling. By this method two advantages are gained, one is that it entirely does away with the great risk to the boiler and machinery, caused by the sudden expansion which takes place when steam is raised in fifteen minutes from cold water, and the other is that it insures the raising of sufficient steam in less than five minutes, which is all that is ever required for practical purposes. The three new land steam fire-engines recently ordered of the same makers, Messrs. Shand and Mason, will be finished shortly, and as they will always be kept ready for immediate use by the expedient already mentioned, it is confidently anticipated that they will be found more effective, and, at the same time, more economical than those worked by manual power.

SOUTH PORCH OF ST. GUDULE, BRUSSELS.

MR. DIGBY WYATT ON THE ARTS OF ITALY.*

IN glass, I am sorry to say, there was but little to praise, with the exception, perhaps, of the ruby glass of Piazaro, near Orvieto, the stained glass generally being inferior to contemporary productions in France, Germany, and England; while in cut and cast glass, the form and ornaments were poor and unworthy of notice. How much of the reproach of insignificance in this department might have been removed had the establishments of Murano freely contributed the results of their best exertions, it is difficult to say. Let us hope that whenever the next Exhibition of the products of United Italy may take place, the descendants of those who in the old time thought it no degradation to their nobility to be masters in the craft and mystery of glass making, may successfully vindicate their forefathers' reputation. In Ceramics, however, there was much to interest.

At the head of this branch of industry stood, without a rival, the Marquis Ginori, who now sustains, to his own credit no less than profit, the old factory at Doccia, founded in 1735 by one of his ancestors. In fine porcelain the productions of the establishment leave little to be desired as to the quality of the paste, but the painting is as yet unequal to the excellence of the material. The most remarkable and characteristic of Ginori's productions are the imitations of ancient Majolica, for his improvements in the manufacture of which the Marquis gracefully acknowledges himself indebted to the talents in chemistry of one of his protégés and assistants, Signor Giusto Cinti, whose death in 1855, while scarcely in the summer of his intellectual powers, may be a source of regret, not to the Marquis only, but to all Italy.

Many of these imitations of ancient Majolica, and more particularly of the Fontana and Zuccheri types of it, are so ably executed as to imperil experienced collectors, who are too apt to believe that it is possible to obtain by chance objects for ten pounds, eagerly sought after by many really well informed in such matters who would not hesitate to give ten times the sum for undoubted specimens of the works imitated. Let one and all discard such vain illusions, and beware of either too cheap or too dear "articles de vertu" in Italy.

I was happy to notice that some of the most graceful of the Doccia productions were purchased by Englishmen, and, among others, one of the smallest, but prettiest, by our friend Mr. Crape.

In one of the great difficulties of the potter's art, that of burning large groups in biscuit, and allowing them to cool without cracking, the Marquis Ginori has not proved altogether successful, yet the design and modelling of his principal specimen deserved a more successful treatment in firing.

Although he may be considered as without any serious rival in the production of porcelain, in some of the appliances of earthenware with enamelled glazes he meets with competitors of almost equal ability. Thus, in the revival of pavements similar to those which floor the celebrated loggia of the Vatican, made, it is believed, by Girolamo della Robbia, Bernardino Papi, of Siena, proves himself a thoroughly capable manufacturer. As also in Ginori's revival of the Luca della Robbia ware, others of the Lombard potteries prove that he is not alone in his knowledge of the processes by which such objects were anciently wrought.

In ordinary terra cottas, such as those suited for stoves, large garden flower pots, and architectural ornaments, Bacci, of Florence, Carlo Vanni, of Impruneta, near Florence, Filippo Martinez, of Palermo, and Raffaele Pisagna, of Lucca, exhibit very excellent productions, thereby demonstrating how widely a knowledge of these processes of old repute in Italy is spread.

Nor is it alone in quality that the specimens forwarded by these manufacturers excel, since in price it would be difficult in any other country, I think, to match them. For example, a really graceful stove in terra cotta, burnt by Purlani, and such as, in this country, I believe, would not, probably, be procurable under £3, I had the pleasure of buying for 25 francs, or £1; a much more ambitious and larger stove, of the same kind, by Ginori, was priced 80 francs, or about £3 4s. It is much to be desired that the Committee of Fine Arts for the decoration of the Horticultural Society's grounds at Kensington may find English manufacturers equal to the production of vases and other features for the embellishment of gardens at similarly reasonable rates, since not a few proprietors of more modest gardens throughout the country are craving for such objects at prices a little less extravagant than those they cannot avoid paying now if they would introduce any similar ornaments amidst their shrubs and flowers.

In ordinary tiles of inlaid clays, suitable for mosaic, the Cavaliere Avila Altoviti, of the Val d'Arno, reigns supreme.

The class of fabrics will, no doubt, be so ably noticed by my friend, your Vice-President, Mr. Winkworth, that I need do no more with respect to them than remark that, as far as my powers of observation extend, in none, with the exception of the embroiderer's art, was there any great evidence of able design in connexion with their production.

For embroidery the Italians have long been celebrated, and many specimens were displayed, better, both in design and execution, than any of those French and Belgium examples which have been so largely manufactured during the last century for the glorification of the rites and ceremonies of the Romish Church. One of the most splendid specimens of such work, although destined for regal rather than ecclesiastical use, was to be observed in the hangings for the royal throne, embroidered in the public Female School at Florence; the design for which, being by no less clever an artist than Pietro Cheloni, was of a highly satisfactory description, and the work reflected credit, more particularly upon the widow Bassi, the teacher of the art of embroidery in that school, under whose special superintendence the whole has been executed.

In dealing with the subject of ornamental carving in wood, we have already taken cognizance of one of the most important elements essential to the production of beautiful furniture. There remain, however, two or three special processes, which have been classed by the Florentine Commissioners under the head of furniture, and which merit particular attention.

The most important of these is unquestionably mosaic in pietre dure, glass, &c.; and, the second, that form of mosaic which consists in the inlaying of different colored woods, and which we generally understand by the name of marquetry.

The former of these processes embraces two distinct varieties, the one suited for internal use only, and the other for both external and internal use.

In the first-named class the now Royal, but formerly Grand Ducal Manufactory, for the execution of what we know as Florentine mosaic, naturally occupied the most eminent position.

Having, in a report I was employed to write for the Board of Trade on a class in which the productions of the Grand Ducal Manufactory were included, in the year 1855, gone at some length into the subject, I need not recapitulate the details I then collected concerning the history and character of that establishment. I may, however, state that the same technical perfection which I had then occasion to praise, and the same faults, as it appeared to me, of judgment in the general design of the principal objects which I then pointed out, may still be considered to characterise the productions forwarded to the Exhibition under notice.

Thus the principal object, upon which it is said that vast sums of money and very many years of labor have been lavished—the altar frontal for the Chapel of the Medici, in San Lorenzo—is, it appears to me, altogether a mistake. With extraordinary patience and skill, materials of the most precious kinds have been selected and fitted to one another with microscopical precision, in order to reproduce a picture of the "Supper at Emmaus;" and, after all, wonderfully, but not successfully. In other objects, such as a magnificent table top, in which flowers, fruit, and birds are introduced, in combination with conventional ornament, a very much happier result is obtained. The best understood, however, of any of the productions of the Royal Manufactory, appeared to me to be the fine wardrobe in walnut wood, inlaid with panels or pietre dure, limited in design to almost entirely conventional ornament.

Private manufacturers have during the last 20 years been creeping up in excellence, as the Grand Ducal fabric has been somewhat losing its old monopoly of excellence; and we now recognise specimens forwarded from private studios of almost equal merit to those wrought at the Government establishment; thus, in point of pictorial mosaic, the centre and medallions of the great table executed by Bianchini, are more effective than the *tour de force* of the royal fabric, the "Supper at Emmaus," although perhaps not quite so perfect in execution. In the centre of this table is a picture of the adoption of Giotto by

Cimabue, executed with extraordinary delicacy and dexterity. Among the highly commendable specimens of this class of mosaic are also the table tops executed by Francesco Betti, and the Brothers Lattici, of Florence.

For those whose pockets are unprepared for such drafts as the purchase of any of these splendid works would necessarily make upon them, similar objects, made in scagliola, and producing an equally brilliant effect, may be obtained at greatly reduced prices. One slab, executed by Picchianti and Son, of Florence, none but the most experienced eye could detect as being an imitation instead of an original.

Of the various materials in which pietre dure slabs are inserted, none appear to me to blend with it more successfully than ebony, and this happy union could not be better exemplified than in the beautiful little casket executed by Barzanti, of Florence, which, both in the excellence of the mosaic and the taste with which the object is made up, could scarcely be exceeded.

In addition to mosaics formed with natural stones and marbles, some specimens of an agreeable, though rather too brilliant effect, formed by the insertion of artificial aventurine, made in glass, into marble and metal work, were exhibited by Signori Bigaglia, of Venice, and, being a novelty, appeared to be highly appreciated by the Italians.

The other branch of mosaic based upon ancient Roman and Byzantine processes, is an art which has been steadily kept up in Italy, partly through the maintenance of the great Papal manufactory at Rome, and partly through the necessity of constantly supplying workmen and materials suited for restoring the great monuments scattered throughout Italy and Sicily, embellished both within and without with this luxurious decoration. But it is only recently that an attempt has been made to organise such facilities of production as may enable private manufacturers to offer their works in this department of industry for public sale. There seems every reason to anticipate that this industry will assume large proportions, from the demand existing for such architectural accessories, not in Italy only, but in all the highly civilised countries of Europe. The best specimens were those sent by Salviati and Vincenzo Redi, of Venice—one a representation of St. Nicholas, from St. Sophia, at Constantinople, evidencing a power to reproduce the ancient Byzantine processes; and the other a figure of Christ, from St. Mark's, at Venice, exhibiting an equal mastery over the Greco-Italian processes employed in that cathedral. Another competitor for patronage in this department of industry was Antonio Gazetta, of Venice. In all of these works the difficulty of producing good flesh tints and properly vitrified gold ground mosaic, appeared to be successfully overcome.

Marquetry—(mosaic in woods)—is an art of oriental origin, communicated to and almost entirely monopolised by the Italians for several centuries of the Middle Ages. In the North of Italy it is still highly popular, and both at Paris, in 1855, and the present Exhibition, numerous specimens were to be seen—not in all cases sufficiently quiet in color, or well understood in application, but almost invariably well and boldly executed.

The absence of Gatti, of Rome, whose ivory and other inlay was so highly admired at Paris, is greatly to be regretted, as nothing in this Exhibition is equal to the small cabinet he there exhibited in 1855.

The best specimen of inlay, and probably one of the best of furniture in the whole Exhibition, is presented to us in the table for a grand saloon, made by Giuseppe Fontana, of Pisa. This piece of furniture is in the fine old Siennese style (that which shortly preceded the year 1500), and leaves little to be desired.

The remaining furniture in the Exhibition is of good average quality, requiring no particular remark, if we except the excellent lac-work, in imitation of Chinese, of Luigi Zampini, of Florence.

Some built-work was sent from Genoa, by Jacinto Grosso. In a carved picture-frame, by Lorenzo Papi, of Florence, I observed a particularly pleasing effect, produced by placing walnut wood carved in open work over a gold ground. I need scarcely note how good and cheap, and how well gilt and burnished, the ordinary carved picture-frames of Florence now are.

In carpets the Italians are altogether behindhand; but some of their silks and velvets for upholstery, particularly the latter, are by no means bad. I did not notice any good lace in the Exhibition, but both at Venice and Genoa I have seen modern nearly equal to the old. Some of the fine thread needlework on cambric was exquisite.

In book production and decoration, although the glories of the classic printers of Italy—the Aldi, Giunta, Goliots, and Bodonis—were not perhaps fully sustained, there were many evidences of excellent capability. In bookbinding, particularly, the houses of Vezzosi of Turin, and Binda of Milan, took very high places, both for excellence of work and taste in the application of ornamental design to the requirements of their special branch of industry.

We have already noticed the perfection attained by the Italians in engraving and chromo-lithography, arts now all but indispensable to the perfection of luxurious typography. It remains only to say a word or two in vindication of the national powers in the art of engraving on wood. I observed scarcely any specimens in the Exhibition, but in contemporary publications, and more particularly in the *Giornale dell'Esposizione Italiana*, I noticed many examples of fair average excellence.

Such are a few of the observations which occur to me in respect to the present of Italian industry, as exemplified by the products displayed in the Exhibition at Florence, and with your permission I will now proceed to add a few remarks touching the even more important question of the possible Italian Art-Industrial future as now foreshadowed.

As there can be no fire without fuel, so there can be no fruitful production without education; and it is from the withdrawal of the restrictions which have hitherto tended to discourage every class of practical instruction throughout most of the States into which Italy has been divided, that the probably most prolific source of future benefit is to be anticipated. Thus, in the fine arts, although many costly literary works, such as the "History of Painting," by the late Professor Rossini, of Pisa; the "Illustrations of the Certosa of Pavia," by Durelli, of Milan, by Cassina, of Venice, by Clognara, of Ancient Art, by Canina, of the Museo Borbonico, by the Neapolitan Government; and of the Florentine and other academies, have been produced mainly in answer to a foreign demand, there is an almost entire blank in the contemporaneous supply of what may be understood as school books of art fit to place in the hands of workmen and students. Since the days of Mengs, Algarotti, and Visconti, but few Italian writers have followed closely those theories of esthetics which have largely engaged public attention in Germany, France, and England, and still fewer have endeavoured to methodise and popularise those texts for the practical instruction of the student.

Gioberti's eloquent and learned essays, "Del Buono," and "Del Bello," are far too ethereal to be palatable to the general reader; while the master mind of Nicolini, the early bent of which inclined strongly towards the solution of art questions, as evidenced in his excellent discourses on Orcagna, Michel Angelo, Leon Battista Alberti, on "The Connection between Poetry and Painting," and on "The Influence of the Arts on Social Life," became subsequently engrossed by political, literary, and educational questions, of even more serious import to Italy.

Among modern writers on the subject of the fine arts, the Count Salvatico, the Marchese Ricci, and the Marchese Roberto D'Azeglio, may be considered as having effected the largest amount of good; but there is still much to be hoped for, now that it is possible for the books published in one part of Italy to be read in others, besides those in which, having eluded the Scylla of state censure, they were imperilled and imprisoned by the Charybdis of heavy and almost impassable barriers of state dues and inquisitorial police.

To the workman, however, there are practical sources of instruction, even more valuable than the text books of his art. These are to be recognised in the works of his contemporaries. What can be imagined more instructive for an apprentice than to have placed under his eyes the best performances of his master contrasted with those of other manufacturers? What more beneficial than to be able to examine the productions of those who in any special branch of industry are superior even to the master he has been accustomed to recognise as to him its practical head? Such instruction is to be derived from Exhibitions such as that under notice; and it is to be hoped that the present may be but the first of a long series in which from year to year, and in different localities, the Italians may take stock of their own advancement, and from time to time enjoy opportunities of comparing their own productions with those of other, and, perhaps, in a commercial sense, more advanced, nations of Europe. The tendency and ultimate result of such comparisons and such stimulants will no doubt be in Italy, as their action has already frequently proved in other countries, to convert exceptional into staple productions; and to lead to the confirmation of a manufacturer, treading with hesitating steps the path of novelty, in branches

* Concluded from page 72.

of industry ultimately destined to confer riches and honor on the land in which they may be originated. There is, too, in these Exhibitions a species of combination and subordination of means to a common end, the moral effect of which, for the Italians especially, cannot but be most excellent; and may tend strongly to correct, by a system of aggregation, the tendency to isolation so largely developed, even among the working classes by antecedent social and political restrictions.

It is difficult for any traveler in Italy now, who may be at all acquainted with the great founts of Della Cruscan literature, not to recognize the deterioration which has befallen the noble Italian language—a deterioration commencing, perhaps, with the resplendent epistles of Marini, and continued through the inanities of the *Compagnia fanosissima della lesina*, and of the still more celebrated Arcadian Academy, to the present comparative decrepitude of once vigorous speech. Owing to a want of untrained communication, and of freedom of discussion, oral or written, on any but the most trivial subjects, there have been developed of late years tendencies to cling to defective *patois*, by way of concealing convictions, on the one hand, and to verbosity, as a means of disguising ignorance, on the other hand, which have nourished the weeds of both Italian thought and Italian language, to the choking up of the flowers which were wont to spring so spontaneously from that ancient hot-bed of civilisation. This will, no doubt, be speedily rectified by a free press, and the facility of intercommunication by means of railways, which will ultimately obliterate the provincialisms complained of.

The same general principles of repression that checked the development of thought, that enfeebled the language, and barred the practical usefulness of the middle classes in Italy, condemned, almost as a conspiracy, any attempt in the lower classes to remedy, by combination, the evils incident to their being left, as it were, without those natural leaders in art and industry which the middle classes in free countries invariably supply to the artisan.

Another unquestionable source of probable benefit to the arts in Italy must be recognised in the development of principles approaching to those of free trade, as opposed to old obnoxious tariffs, and in the increase of commerce, and the profits arising from trade and manufacture to be thereby induced; for we cannot forget that it was out of the fulness of business profits, rather than any other source, that the funds were supplied in old times which led to the creation of those noble monuments which gave to Italy of the fifteenth century its pre-eminent position in the history of art and art-industry.

While it is true that a high development of social and political liberty, in cases where the genius of the people is not bent in that direction, it is certain that where the tendency of a population is so strongly set as to have maintained, during ages of repression, and under circumstances of the most antagonistic description, such an amount of capability as is now manifested by the Italians, those germs—dormant, or nearly so, during periods such as those referred to—will fructify a hundredfold under institutions calculated to develop personal independence, and free action in that direction towards which the sympathies and aspirations of an enthusiastic people congenitally tend.

A comparison of the past with the present, and a correct appreciation of the phenomena of each, may certainly justify what has been predicted of the future of Italian art-industry; but there exists yet another source from which as much fruit may be probably anticipated, as from any of the reliable conducing causes to which allusion has been made. Such a source is to be found in what is commonly called "the chapter of accidents." As, perhaps, the brightest, though most sadly tarnished, American genius, Edgar Poe, acutely remarks: "The history of human knowledge has so uninterruptedly shown that, collateral, or incidental, or accidental events, we are indebted for the most numerous and most valuable discoveries, that it has at length become necessary, in any prospective views of improvement, to make not only large, but the largest, allowances for inventions that shall arise by chance, and quite out of the range of ordinary expectation. It is no longer philosophical to base upon what has been a vision of what is to be. Accident is admitted as a portion of the substructure. We make chance a matter of absolute calculation." Without going so far as this writer, we may yet carry a large sum to the credit side of our account from what mathematicians have designated "the doctrine of probabilities."

Thus, then, it is with a hope almost approaching to certain anticipation, and in serious thought rather than glowing sympathy, that I venture to augur, from the combination of the excellence already attained, with the facilities for progress opened by its new political constitution, a future for the arts and industries of Italy, such as may place them on a level with, if not in advance of, the most successful worshippers at the shrine of beauty in any other country of Europe.

It remains for us now, in the last section of this essay, only to endeavour to derive practically the largest amount of benefit we can from the past experiences of the Italians, and from the lessons which their productions, past and present, may teach us in the present day.

The most important of these, it appears to me, is to recognise how, under all circumstances, the Italian demands art, not as a luxury but as a necessity. If he cannot have it in good material he will have it in bad; but in some shape or other his eyes must be gratified with that without which vision would be to him but comparative blindness.

If, for instance, the view from one of his saloons is terminated by blank wall, as is the fate of many of those who dwell in our London houses, rather than let that wall remain a blank he will employ an artist to make him a design of an architectural or pictorial character. That design, if his means permit him to execute in marble, no material will be too costly for him to employ; if he cannot have it in marble he will have it in stone; if he cannot afford it in stone it will be in stucco; if he cannot afford it in stucco he will have it painted; if he cannot afford to pay anybody to paint it he will endeavour to do it himself; if he cannot paint it himself, or afford to pay for its being done, he will cover it with creepers—but supply his craving he most assuredly will. If we could feel the same active want, it is unquestionable that our greater amount of vital energy and greater wealth would lead us even better to supply our cravings than the Italian is enabled to gratify his.

What, then, is most wanting in us is an ardent desire for the beautiful. I am far from saying that this desire does not exist in a large and rapidly increasing percentage of the English people, but with us it is so interjectional a sensation as to lead to comparatively little practical result. The rich man, who sees a picture or statue which pleases him, will buy one or other, or both, but how seldom with the least consideration of special fitness for supplying any particular want, much thought of, long cherished, and carefully determined upon! The nature of such a want, and the best mode of supplying it, will occupy the earnest thoughts of the Italian; but with an Englishman, in a general way, the inclination will be but desultory, and if not supplied at a moment when strongly felt it will pass away, and, perhaps, never meet with realisation at all.

Another lesson of great importance to us may be derived from the fact that, both in the past and in the present, the Italians have never been in the habit of looking at any one art as perfect in a condition of isolation from others. To produce for them the effect of beauty or nobleness, all must contribute. Color is just as essential as sculptural form, and both must be held in subordination by the symmetrical conditions of architectonic disposition of lines and spaces.

We, unfortunately, now see too many of the great monuments of Italian art stripped of half their furniture; but if, from the relics of perishable objects preserved in museums, such as that at South Kensington, we attempt to restore to those denuded monuments, to those ransacked palaces, those "banquet halls deserted," the embellishments we recognise as having formerly belonged to them, we shall at once see that the attainment of a really perfect effect in monuments, the beauty of which was dependent upon the combination of the Fine Arts, could only, in Italian eyes, be properly effected by super-adding with profusion all that the industry and ingenuity of the most skilful workman could produce in the Industrial Arts.

To the union of all the fine arts among themselves, with the industrial arts attending as their handmaids, we must look as the most important element in all magnificence; and if we would emulate the Italians, we must not rest until we have learned to blend all cognate arts and industries in harmony.

The third great merit in the best Italian production, whether in a small article of industry, or in the most magnificent monument, is nobility of inclination.

The mistake, for instance, of building the front of a palace in stone and suddenly dropping off the instant the corner is turned into brick, might occur to even a millionaire in this economical age, but would scarcely have presented itself to a Medici, or a Farnese, in the

old days of Italian magnificence. Not that the wealth, or the inclination to do what is handsome, might be less in the one case than in the other, but that public opinion and system would keep the patrons of old straight, and allow those of to-day to fall into what cannot but be regarded as an architectural meanness.

It would be, of course, too hard to point to any particular cases where hundreds are almost daily guilty of committing similar solecisms in taste, but unless we are to look for the exemplification of nobility of structure to those whose means place it within their power, how can we expect it from those to whom an increased expenditure might be a really important consideration.

Nobility of material lavishly used, ample space, solidity of structure, and the gift to the eye of something obviously designed rather to please than to pay, together with the effect that such departures from rigid utilitarianism produce instinctively on the spectator,—sources of effect lavishly indulged in in Italy at every period of her history, are only beginning to be appreciated amongst us in the present day.

At the times when architects, such as Inigo Jones, Wren, Gibbs, and Chambers, endeavored to maintain in this country the principles of grand Italian architecture, founded upon the universal practice during the best classical and medieval periods, marble, oak and stone were freely used. Cortices and loggias, colonnades and arcades, were not banished as profligate waste of ground and money. Carving, and the elaborate working out of ornamental features in true and just proportion, were considered to be essential to fine effects. Paintings were not to be hung as by accident against walls—here a Madonna, and there a set of bores drinking—but allotted places were provided for them in the vaults and on the walls of the principal apartments. Sculpture, too, found its niches, and when English talent failed to supply it, the services of foreigners, in spite of strong insular prejudices, were freely enlisted. And it was precisely when the public taste adopted a meaner class of building materials, a grudging spirit in the distribution of space, and a lower kind of internal decoration, that the art of design in this country, with some few honorable exceptions, fell to zero. From that pitch (if I may use the expression) of degradation and disintegration they are now happily rising into a concrete and perfect form, with a reaction the vigor of which is scarcely to be paralleled in the world's history. We are beginning to do better in each separate department of production; we are beginning to recognise that excellence in one must necessarily be combined with excellence in others; and we are beginning, in fact, to learn and practise the very system still lingering in the hearts and habits of the Italians. May we advance with them, and they with us—for it is one of the happiest conditions of all true art that, if it be worthily carried to perfection, its universality must breed honorable emulation, but never envy or jealousy.

THE LEICESTERSHIRE ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

THE general annual meeting of the members of this Society was held in the Town Library, Guildhall, Leicester, on the 27th of January.

The Rev. ROBERT BURNABY being called to the chair, requested Mr. G. C. BELLAIRS, the Financial Secretary, to lay before the meeting a statement of accounts for the past year, from which it appeared that there was, after all expenses were paid, a balance of about £26 in his hands.

Mr. T. NORTH then presented and read the report for the year 1861, which briefly adverted to one or two works carried out during the past year.

The work of restoration at St. Mary's Church, Leicester, has been further aided by the re-building—it can scarcely be said restoration, as there was little or nothing of the ancient work left to guide the architect in his designs—of St. Ann's Chapel, through the liberality of the Misses Noble. This venerable church is now an epitome of Gothic architecture, claiming and receiving the attention and the admiration of all who view the chasteness and extreme beauty of all its parts.

The excavations of St. Martin's, Leicester, have brought to light many antiquities of great interest. Several considerable portions of the foundations of ancient walls have been discovered, and upon removing the earth—in July last—on the north side of the church, close to the palisading dividing the church ground from the Townhall-lane, the workmen came to a rubble wall of considerable thickness, surmounted by a wrought stone platform, upon which stood the bases of two massive Doric columns, each about 2 feet in diameter. These columns in all probability formed a portion of a colonnade, which, judging from the size and the space intervening between them—about 10 feet—would be one of considerable length. The earth in the interior also contained numerous fragments of Roman pottery, and the bones of animals and birds. Two coins, the one of Nero and the other of Constantine, were likewise turned up; the truth of the tradition that a Roman temple stood upon the site of the present church being thus, it is presumed, unequivocally proved. Upon taking down the tower, several fragments of medieval coffins, corbels, and other pieces of carved stone, were met with in the later portions of it, the builders having apparently, without much respect for the remains of an earlier age, used all the available stone within their reach. Owing to an unfortunate dispute between the contractors and the London workmen, the works at this church have progressed but slowly; now, however, a more rapid progression is visible.

St. Andrew's Church, Leicester, is near to completion, and, as an experiment testing the adaptation (in the hands of Mr. Scott) of brick in the erection of an ecclesiastical edifice without internal piers, is worthy of the closest inspection and scrutiny.

The very beautiful schools and school-house at Belgrave, from the designs of Mr. Gillett, architect, Leicester, were opened early this year. As examples of Gothic buildings, admirably adapted for the purposes for which they were erected, the Committee draw attention to them with satisfaction and pleasure.

Many other works of church restoration in the county have been begun or completed during the year, among which may be named Stoughton Church, the tower of which has been taken down and rebuilt with great care through the liberality of a member of your Society. Other portions of the church wall, as need requires and circumstances permit, also receive careful attention. Considerable works have been carried on in the churches at Husbands Bosworth, Hathern, Osgathorpe, &c. &c., whilst at St. Margaret's, Leicester, the works of repairs and restoration have not been lost sight of.

The general meetings and excursions of the Society were held last year at Lutterworth,* when its church, and that of Misterton, were inspected. The Museum, which was rich in antiquarian objects and works of art, liberally sent from both rich and poor in the neighborhood, was most numerously attended.

In conclusion, the Committee congratulate the Society upon the addition of many new names to its list of subscribers during the past year, no fewer than 45 gentlemen having enrolled their names as members. They have, at the same time, to regret the loss of a few by death and withdrawal. This addition to the members, and consequently to the resources of the Society, has determined the Committee in carrying out a project which has many times been brought before them, namely, the publication of the past transactions of the Society. It is hoped that the first yearly part will be in the hands of members in the spring of 1862.

Upon moving the adoption of this report remarks were made upon several matters referred to in it; whilst fully admitting the beauty and utility of the new schools at Belgrave, several members thought the plan and design there carried out far too elaborate and costly for villagers generally, and Birstall school, erected a short time ago, was mentioned as a good type of a small village school where funds were small, and the attendance of children not likely to be very large.

The rebuilding of the tower of Stoughton Church was likewise commented on, and the manner in which the works have been carried on, strongly urged upon the attention of all interested or engaged in church restoration, as an example of most literal restoration. In fact, the work of the mason has been simply the

* See Vol. VII., page 823.

taking down the tower—which was in a dangerous state—and so rebuilding it as to place every stone again in its original place, only inserting new stone where the decayed state of the old rendered such a course absolutely necessary. The restoration is so perfect that a casual observer would not detect the recent work of the mason upon the materials.

Among the articles exhibited were: by Mr. John Hunt, a Roman coin found in the Belgrave gravel-pit, the inscription upon which was almost obliterated; it was apparently a first bronze of Constantine. Several other Roman coins, among which was one of Carausius, who reigned in Britain towards the close of the third century. A fibula, flint arrow heads, curiously formed flints, apparently worked into shape for sling-stones, all found between Great Dalby and Burrow-on-the-Hill. A hilted sword found in a drain near Bosworth, Leicestershire, bearing the date near the hilt, "Anno 1670."

Mr. G. C. NEALE exhibited an illuminated manuscript volume of prayers, &c., preceded by a calendar.

Mr. G. H. NEVINSON placed upon the table a Roman needle and bronze pin found in Leicester, and, on behalf of Mr. Pindar, exhibited a curious pack of playing cards, upon which were depicted the leading incidents connected with the murder of Sir Edmundbury Godfrey, in 1678; the famous plot said on the card to be "hatched at Rome!" The denomination of each card appeared at the corner, not colored, but heraldically lined. The Pope's head with triple crown supplied the knave.

Mr. H. GODDARD produced two Forms of Prayer set forth respectively in 1694 and 1745, for success to our arms by sea and land; a Roman bone spoon found in Causeway-lane, Leicester, together with a vase which is now in the Leicester Museum; also two enamels on copper, by Laudin, the one with the legend "S. Ignatius de Loiola," the other "S. Francisus Xaverius," being the work of the early part of the seventeenth century.

It was resolved that the general meeting in the ensuing summer be held at Bosworth.

THE CONSERVATION OF ANCIENT ARCHITECTURAL MONUMENTS AND REMAINS.

AT the ordinary general meeting of the Royal Institute of British Architects, held at the rooms, on Monday evening, Mr. M. DIGBY WYATT, V.P., in the chair, the discussion on Mr. G. G. Scott's paper, "On the Conservation of Ancient Architectural Monuments and Remains," was resumed.

Mr. G. GILBERT SCOTT remarked that he thought the meeting would believe him when he said that his paper contained about the whole he could say on the subject. However, as his paper had been published, and he was afraid its length had prevented some gentlemen from reading it in the architectural papers, he would call attention to the proposals and suggestions he had made respecting conservation, and particularly to the motion with which he concluded his paper. The general sentiment of his paper was the great damage constantly suffered by and inflicted upon the ancient remains of the architecture of this country by the several causes of time, neglect, and ruthless alteration and restoration. Though they could not resist the hand of time and could not arrest other causes of decay, yet, by attention to buildings, the decay might be, to some extent, arrested, and thus might be preserved remains which our country was at present so happily studded with. As to restoration and repairs of ancient buildings, he thought there should be some vigilant watch constantly kept upon them by persons whose line of study it was to look to them in order to their preservation. And though the whole could not be done by the Royal Institute of British Architects, yet he thought from the Institute should emanate certain communications, to be kept up by other societies throughout the kingdom, in order to a constant watch being kept on buildings, whether ancient ruins or buildings still in use and subject to decay, or to the more frequent course of restoration and ruthless conduct in the way of alteration. He thought any one who had visited the remains of this country could not have failed to notice the constant destruction and ruin going on. And, even if their operations were limited to that matter alone, it would be well for them to form themselves into a vigilance committee, and to communicate with kindred societies throughout the kingdom, for thereby they could do something to arrest that constant loss which, in course of time, would deprive us of those valuable monuments. But when they added to that the ruthless and ill-judged alterations going on in the restoration of our churches, he thought that such a committee was much more strongly called for. It would be found that it was not so difficult to contend with the ravages of time as with the wills of men in the ruthless and unnecessary alterations or removals of buildings. He therefore proposed they should form a standing committee of the Institute, which should not only watch and carefully observe what was going on, what was required, and keep their attention upon buildings which required observation, but also maintain a constant system of communication with other architectural and antiquarian societies throughout the kingdom, with the view of inducing them to form in their own districts kindred committees or societies, so that they might communicate with each other, and thereby extend their ramifications throughout the whole country. It seemed to him that, if they acted upon his suggestion, they could do a very great deal, though they might not be able to do all they wished. As regarded our churches, of course that was a matter of individual will, as he said before. Now, he could not suppose that all those persons who damaged our churches by making alterations did so from intention, but rather from not considering the subject properly. Now, one part of the duty of the committee he proposed should be appointed would, perhaps, be to consider the subject of the extent and limit of alterations, and to draw up a certain code of rules suggesting to societies throughout the kingdom what course the Committee of the Institute would like to be carried out in respect of buildings to which their attention might be directed. If therefore proposed, what he did at the close of his paper, that the Institute take the initiative in laying down, in conjunction with other architectural and antiquarian societies throughout the country, a code of rules for the treatment of buildings and restorations, and that, for that purpose, a standing committee be appointed to act with other societies.

Mr. G. E. STREET seconded Mr. Scott's motion with the greatest possible pleasure, because it appeared to him that the Committee proposed to be appointed was calculated to effect the greatest possible amount of good. Before he proceeded to say what he intended doing in support of Mr. Scott's views, he would briefly refer in opposition to views which dropped from two gentlemen, one of whom was present (Mr. Godwin), at the close of the reading of the paper. One of the views thrown out was that it would be well to memorialise Government to appoint a commission to inspect and draw up a report and catalogue respecting all ancient monuments under the care of the Government. Now, he thought that such a proposal was fraught with danger to the public and to art, and trusted that Mr. Scott's motion would take the place of such a proposition. They had only to cross the channel and see what had been done by Government Commissioners there. There had been a very skilled commission on the part of Frenchmen, and they made reports of extreme value, but the reports went two ways; they cut down buildings and recommended their restoration. And it was seen that the most grievous damage had been done to some of the buildings restored by the French Government. He thought he knew what would be the feeling of the profession if such a Government commission was appointed in this country. Were such a commission appointed, there would, no doubt, be a Government Secretary, a Government Engineer, and other Government officials, and he thought they ought not to put themselves under the tender mercies of such a body. Mr. Scott spoke of the proposed committee as a Vigilance Committee to have a veto on works that had not been properly carried out, or as they ought to have been done. But it was impossible to have such a veto; such a power could only be obtained by Act of Parliament; and even if they asked for such a power it was not likely it would be granted. He thought that, from time to time, the aid of those not immediately connected with the profession would be of great importance to the Committee proposed to be formed, and be of

great service to the profession in the saving of old buildings. One very large class of our buildings had guardians whose duty it was to take care of the edifices; all the churches in England had their legal guardians—bishops, archdeacons, and rural dean—whose peculiar province it was to see that our ancient ecclesiastical buildings were conserved in the most proper way; and he thought they ought to make suggestions to such guardians. It was the duty of the bishop of every diocese to look after the alterations proposed to be made in any church in his diocese; and the Bishop of Oxford set an example in this respect by insisting that all proposed alterations of churches in his diocese must be submitted to him, so that he might see whether anything of a destructive character or injurious to the church was contemplated. (He Mr. Street) thought it would be quite within the power of such a Committee as that which Mr. Scott proposed to make some movement with the bishops, archdeacons, and rural deans, and even the two Houses of Convocation, besides those officers of the church who were bound to attend to certain duties in reference to the fabric of the church. And there was a very large number of societies throughout the kingdom whose assistance would be of great advantage. Mr. Parker, of Oxford, had published an Ecclesiastical Topographical Dictionary of certain districts of the country, and he (Mr. Street) thought that, with an active machinery in full operation throughout the country, they might secure an ecclesiastical topography of England. What was formerly the Camden Society of Cambridge, now the Ecclesiological Society, had large stores of that kind. These were some of the ways in which the new organisation proposed might be made to work effectually. But no organisation or information they could obtain would do permanent good without a very careful education of architects, and that was one of Mr. Scott's strong points in his lecture, in which he had to say some things as unpleasant as they were true. Unfortunately, Mr. Scott had to allow that much as was the injury our buildings received from age and weather, they also suffered from bad treatment. One saw many churches restored by men who had gone to work in a most reckless manner, and the loss thereby occasioned could not be replaced. Architects ought to take care of old buildings, and he thought the committee proposed by Mr. Scott would be productive of the greatest possible advantage. As to the mode of dealing with old buildings, he thought they must all agree with what Mr. Scott had said in his paper. So long as they could keep an old building on its legs by buttressing and other means, so much the better; but then the next best thing was to get as good a copy as possible of the old one. There were some details in the restoration of ancient buildings which, if attended to, would make more difficult the failures they frequently met with. He thought that in all cases of church restoration there should be established in the church itself a sort of small museum for the reception of fragments of glass, sculpture, and so on. Then, as to the taking possession of curious fragments found in buildings, he always looked on a collector as the most wicked of men—(A laugh). The restoration of old work always required a most careful study of old work in the surrounding neighbourhood; and when an architect found a similarity between one point in a building and another point of the same kind in another building, he ought to take a note of it. One of the reasons for the existence of inferior restorations was that young architects had not devoted sufficient study to the ancient architecture of their own country. He advised young students to go about the country studying and sketching old buildings, a custom which he was afraid was not more practised now than it was some years ago.

Mr. C. F. HAYWARD was sure they all considered that the proposed committee would be a most valuable one. He then proceeded to remark that during the vacation in autumn, instead of going to the United States, he went to Dublin, where he visited the cathedral, which he found undergoing the process of restoration. He inquired very anxiously who had charge of the work, but he could not find out that anybody whatever had charge of the work but the builder. He found a person who called himself the clerk of the works, and he believed he spoke to the builder himself, and made every possible inquiry to ascertain under whose superintendence the work was going on, but was unsuccessful. He understood that one gentleman in Dublin was at the sole expense of this restoration, but it depended on the way in which such a restoration was carried out, whether, a century hence, architects would be thankful to Mr. Guinness for spending £40,000 or £50,000, or even a larger sum of money. He thought that somebody should have control over such a restoration, and it grieved him that no name of authority was forthcoming. He considered one portion of Mr. Scott's paper peculiarly valuable, and that was the portion where he gave suggestions for practice under various circumstances.

Mr. GILES said that such a court as Mr. Scott proposed to establish would be of infinite benefit, and he hoped and trusted it would be established. A central court of appeal would be of great advantage to country societies, in proof of which he mentioned several facts which had come under his own knowledge.

Mr. G. GODWIN was rather sorry that Mr. Street, in supporting Mr. Scott's motion, seemed to be abandoning any idea of interesting the Government in the object they had in view, because he felt himself that the desired good would not be done without something of that kind being done. He was sure that very great advantage would follow the establishment of the proposed committee, but feared that all the good would not be done by it that could be effected by an appeal to the Government. In 1840 endeavors were made by Mr. Britton and others for the establishment of some such body as that now proposed. In 1840 Mr. Britton addressed a letter to Mr. Joseph Hume on the subject, and ultimately that led Mr. Hume to move in the House of Commons for the appointment of a committee of inquiry, and that committee was appointed, sat and took evidence, published a considerable blue book, but nothing further came of it. Then, again, in 1853, Mr. Wyse was induced to take steps in the matter, and he moved for a commission for the conservation of national monuments, but the motion then failed; but every one saw its necessity, and that necessity had not been lessened by local efforts being made, and therefore it seemed to him that this was the time when such a question should be brought before the Government; reporters did not now, as they formerly did, close their books when art was mentioned, and especially architecture. A different policy was now abroad, and he hoped that those who should compose the proposed committee would be led to suggest to the Office of Works—as Mr. Donaldson proposed after the reading of Mr. Scott's paper—that they should have at least made out a catalogue of the buildings under their charge. He commended most seriously to the committee to be appointed the propriety of moving the Government on the subject.

Mr. SCOTT thought both the danger and the benefit of such a proposal ought to be watched and well weighed by the proposed committee, and it would form a fair subject for consideration.

Mr. J. W. PAPWORTH wished to ask if the action of the Committee was to be confined to England, and, if not, how far it was to extend.

Mr. SCOTT thought their business was to begin at home, to say the least. At the same time, if any grand case came under their notice—for instance, in France, threatening destruction by restoration, he thought it would be a proper subject for consideration, so that the Committee might send a memorial to the proper authorities, offering suggestions on the subject. As a general principle they should look at home objects.

Mr. J. W. PAPWORTH wished to know if the proposed committee was to be appointed for life, or for what length of time.

Mr. HAYTER LEWIS, Hon. Sec., said if the Committee was to be appointed by the Council, as was intended, it would go on from year to year, or until it had accomplished the object for which it was appointed.

The CHAIRMAN—If the Council had the power to appoint a committee, they had also the power to change the members from time to time.

Mr. J. W. PAPWORTH asked what expenses were to be allowed to the committee.

The CHAIRMAN—It would be for the Council to decide upon that, which they had authority to do by the rules of the Institute.

Mr. J. W. PAPWORTH was opposed to the establishment of the proposed court of criticism; as a court of appeal such a committee as that proposed to be appointed would be highly objectionable. Would not such a committee, if it acted, be exposed to actions for libel?

Some verbal alterations were then made in the motion proposed by Mr. Scott. A conversation followed, in the course of which Mr. SCOTT observed that the matter of expenses would be under the control of the Council, who would not allow the committee to go into any unreasonable expenditure. As to the proposed committee forming themselves into a court of appeal he did not mean that.

Mr. J. W. PAPWORTH did not impute that to Mr. Scott.

Mr. SCOTT—It was also never intended by him that the committee should do anything

that would render them liable to an action for libel. He thought that the committee, as he proposed its establishment, would act under a perfect safe-guard.

Mr. J. W. PAPWORTH moved as an amendment that the word "standing," as applied to the proposed committee in the motion, be omitted.

Mr. JENNINGS seconded the amendment. He thought it was an important matter to have a committee appointed to consider the question of the repair, but not the restoration, of buildings. When repair became necessary, restoration might become requisite, but not until then; he should not advocate the committee to interfere on the ground of restoration, but he thought the committee could do an immense deal of good on the general subject of restoration when repairs were going forward. The clergy were doing a great deal in the way of restoring churches, and it would be well for the Institute to communicate with them. Another matter which the proposed committee should do would be to communicate with the owners of ancient buildings. He was of opinion that when such a committee was appointed, the names of the committee ought to be submitted to the members of the Institute at large, and also thought that it would be well to have a more permanent Council than they had at present. The present system did not work well, and he thought it would be judicious to have it altered. He should prefer a committee of the Council to look after this matter, and that gave rise to his objection to the use of the word "standing" in reference to the proposed committee. He was of opinion that the better plan would be for the Council to appoint a committee every year, and if the committee did their business properly, the Council would, no doubt, appoint the same men again. The proposed committee should be appointed from year to year, instead of being a "standing" committee.

After some further conversation the word "standing" was struck out of the motion, and Mr. Papworth's amendment was, of course, withdrawn.

Mr. J. W. PAPWORTH then moved, as another amendment, that the word "rules" in the motion be omitted.

Mr. G. GODWIN was opposed to giving to the proposed committee, of whose names they knew nothing, so much power as to establish rules.

Mr. ROBERT KERR was wishful that the Institute should step into all paths of usefulness, but thought they had no authority to appoint the proposed committee with such powers as seemed to be involved in the discussion. He should be very jealous of the action of the proposed committee in its legislative character. He thought any inquiries and suggestions made by such a committee would be received with the greatest respect by the members of the Institute; but if it was to be an inquisitorial committee, to investigate the works of architects by which they made their living, the result would be that the committee would be stigmatised for going beyond the province marked out for it by the Institute.

The CHAIRMAN thought the Institute's action would be most usefully employed in affiliating themselves with the archaeological societies. If they could get the Archaeological Institute and the Archaeological Association to know that the Institute was wishful to assist them, the results might be very beneficial; and, probably, by associating the action of the Institute with one or both of those bodies, more good would be effected than by acting separately.

Mr. SCOTT said he should be sorry, because they saw difficulties, or imagined ones, that this important subject should fall to the ground, and he should be sorry that a work of such importance should arise or originate with any other body than their own. He thought they ought to take the initiative, and not, by letting the matter drop, let another society take it up where they left it. He thought there could be no objection to the suggestions and instructions of the proposed committee being submitted to the Institute before taking effect.

A conversation followed, in the course of which the word "rules" was struck out of the motion, and, consequently, Mr. Papworth's amendment was withdrawn.

Mr. J. W. PAPWORTH then proposed another amendment, to the effect—"That a Committee be appointed to draw up a series of practical regulations for the treatment of buildings requiring reparation, and that the Committee report to a general meeting of the Institute their recommendations for confirmation."

The amendment was seconded, but, on being put to the vote, negatived.

Mr. ROBERT KERR then moved, as an amendment to the motion—"That the Council be requested to appoint a committee to investigate the subject of conserving ancient British buildings, and to report to the Institute, from time to time, any measures which the said committee may deem desirable."

Mr. PORTER seconded the amendment.

On the vote being taken, there were—for the amendment, 7; against it, 9. The amendment was, consequently, lost.

The CHAIRMAN then put to the meeting the motion of Mr. Scott, which, after various alterations had been made in it, stood as follows:—"That the Council be requested to nominate a committee to draw up a series of practical suggestions for the treatment of buildings requiring reparation, and to put themselves into communication with other architectural and antiquarian societies, with a view to obtaining their co-operation in considering such measures as their united wisdom may suggest for the promotion of the faithful and authentic conservation of ancient monuments and remains, and to report on the same to this Institute."

The motion was carried, and the meeting separated.

ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of this Association was held at the Rooms, 9, Conduit-street, Regent-street, on Friday evening, Mr. A. W. BLOMFIELD, M.A., President, in the chair.

Mr. ARTHUR SMITH, honorary secretary, having read the minutes of the last meeting, stated that a number of the members of the Association visited a portion of the Underground Metropolitan Railway on the previous Saturday afternoon, and were highly gratified with the excursion.

New Members.—The following gentlemen, having been balloted for, were duly elected members of the Association:—Mr. J. Johnson, Cliff-street, New North-road; and Mr. North, Radnor-street, Chelsea.

The Induration of Stone.—Mr. A. H. CHURCH, chemist, then read a paper on the Induration and Preservation of Stone, which we shall give hereafter.

The CHAIRMAN said he should like to be informed whether there was any peculiar action in the air at the sea side which was detrimental to freestone or soft stone?

Mr. CHURCH said a very curious discovery had recently been made; it would not be supposed so, but it was the fact, that the sea spray was carried two or three miles inland; there was no place where the dust had not fragments of sea spray in it, and it was full of carbonate of sodium. And several other substances had been found in towns far removed from the sea and residue of the sea spray. No doubt the stone referred to would, by such means, be injuriously acted upon.

Mr. TROTMAN having been called upon by the Chairman, said he was interested in one of the processes which had been mentioned by Mr. Church in his paper, he referred to the formation of the silicate of alumina, which was produced by the application of silicate of potash and aluminate of potash. The late Prince Consort published a translation of a work by Messrs. Fuchs and Kuhlmann, which contained a great deal about stereo-chromy. A perusal of that book led the firm he represented to make lengthened investigations and experiments, and eventually to the adoption by them of the process called the silicate of alumina. The speaker then proceeded to describe the process, which he thought would be found of great use in the preservation of stone. Silica was the principal material in the process, and that in the form of silicate of potash; but, lest silicate of soda and potash should be deemed synonymous, he would say that in this process they were by no means identical, the silicate of soda producing results both unsatisfactory and valueless. The second material was the aluminate of potash. Of this, in the form of an aqueous solution, we find it stated by all chemical authorities to the present time that it precipitates an hydrate of alumina, difficultly soluble in excess of the precipitant; and thus we found it behave after forty-eight hours, precipitating most bulky in heavy solutions, and as much so in proportion in light specific gravities. He need not say how valueless was such a solution commercially, nor tell the difficulties attending the discovery of a simple remedy, so simple as the determination of the particular specific gravity at which it would not precipitate. The behaviour of the aluminate with water is remarkable, seeing that one atom of alumina held in perfect

solution by say three atoms of water should be precipitated by the addition of a fourth, or by the withdrawal of one of the three atoms. The aluminate used is prepared from a fused compound of alumina and potash, which product, being highly deliquescent, is easily soluble in water, and so nearly neutral as to contain in its best form of manufacture but 2 per cent. of free potash. In the combination of silicate of potash and this aluminate of potash consisted the process, the consideration of which afforded some most interesting details. When silicate of potash, specific gravity 1.250, and aluminate of potash, specific gravity 1.200, are mixed together, an instantaneous decomposition takes place, and the result is a solid mass, consisting of silicate of alumina and some free potash. This hardened with extraordinary rapidity, and was a most beautiful example of the great affinity of silica for alumina. But take a solution of a lighter specific gravity, and it was found that decomposition did not instantaneously take place. On the contrary, the liquidity of the two solutions in combination was retained for a time, only, however, proportioned to the quantity of water with which it was diluted. Thus a specific gravity of 1.150 would last as a solution ten hours, while at 1.200 it solidified immediately. The cause of this arrest of the decomposition—if indeed, it was arrested—and the peculiar part the water played in this interchange of elements, would yield a field of interesting inquiry. The results were, firstly, the time so necessary for manipulation is given in the use of these materials, which in themselves, secure an insoluble product by their mutual decomposition. Secondly, that the agent and re-agent being mixed in one solution, there can be no fear of the one or the other being in excess or unneutralised, as in the use of acid or second solutions. Thirdly, the product resulting from this combination of silicate of potash and alumina was insoluble in dilute sulphuric and hydrochloric acids. And, lastly, if Anston, Bath, and Caen stone, or chalk were pounded, this product would recombine them, thus showing that its chemical affinities are in favor of the material with which it was proposed to impregnate the stone. Finally, in the works of Fuchs and the brochures of Kuhlmann the foreshadowing of this process may be seen; and in the Report of the Commission appointed to investigate the causes of the decay of the Houses of Parliament, there are mentioned, though not in conjunction, the very materials proposed to be used by this process. He need hardly say that they had had to go over the ground again and again, finding difficulties which had to be overcome, until they obtained the proper proportions of the ingredients. But now, having obtained the proper proportions, they could get a hard mass like gelatine, and it was a very important material for painters, especially those employed in stereo-chromy. The specific gravity being light, its entrance into the stone was very free, and its combining qualities very great.

Mr. T. ROGER SMITH said he thought all would agree with him that they were much obliged to Mr. Church for his paper. As regarded the actual bearings of the question of the induration of stone in their professional practice, it struck him there were just two circumstances to be considered. The first was the case of buildings in a state of decay coming into their hands, and which were to be made the most of, and the second was the case of erecting new buildings in a bad atmosphere, with the desire of doing the best for them. As to buildings in a state of decay, it would be a most important thing for architects to use such a process as was clearly proved to be of advantage. But he thought they must hold that, as far as they knew, there was nothing before them that was so decidedly proved, or had the unanimous consent of learned men as being successful, to lead them to have the utmost confidence in it. Still there were processes that deserved confidence, and, no doubt, some of them, as they knew them more, would obtain confidence. As to the possibility of baking stone to dry out the watery particles before any chemical agents were used, sometimes the heat of summer would do that. With regard to new buildings, it seemed to him the whole of their safety as architects, especially in an atmosphere like that of London, lay in a scrupulous and careful use of good material, and that was urged upon them in the report of the Commissioners appointed on the stone of the Houses of Parliament. They ought to make a very careful selection of the materials to be used. The number of materials that would stand in the London atmosphere was not very great, but some had stood better than others, such as Portland stone, some Bath stone, &c. In his opinion position would sometimes influence the decay of stone. He should be extremely glad if Mr. Church could refer them to some good durable building stones.

Mr. CHURCH said he was not inclined to speak with any degree of confidence as to the durability of building stones, but they knew Portland stone was the best that had been used in London buildings, and no fault could be found with some magnesian or dolomite stone. He was at the present time engaged in examining different kinds of stones which could be used in London, and he intended publishing a short account of their behaviour under chemical tests.

Mr. ROGER SMITH thought a mistake had been committed in building so much in lime and Bath stone. Sandstone could be easily procured from Yorkshire and Derbyshire for London use. He had found Darley stone exceedingly valuable.

The CHAIRMAN said one of the causes of the frequent use of Bath stone was its cheapness, but Mr. Smith said they could get other stones as cheap. He should like to know if Mr. Church had examined the stone of Ketton, in Northamptonshire.

Mr. CHURCH said he had not.

The CHAIRMAN remarked that St. Dunstan's was built of it, and it seemed to stand London weather very well.

BRITISH ARCHAEOLOGICAL ASSOCIATION.

AT the meeting on the 22nd ult., T. J. PESTIGREW, V.P., in the chair, T. H. Le Keux, Esq., was elected an Associate. Mr. MOORE forwarded particulars relating to the discovery of a Roman villa in a field called Chessell's West Coker, Somersetshire. In reference to the discovery of a leaden coffin at Worcester Cathedral, announced at the previous meeting, Mr. CUNING mentioned other instances in which they had been found of human form. These were of James IV. of Scotland, buried at the Monastery of Sheen, in 1513; of Mary, Countess of Arundel, in the chapel formerly belonging to the College of the Holy Trinity, at Arundel, in 1557; of Henry Prince of Wales, in a vault on the north side of Henry VII.'s Chapel at Westminster, in 1612; and of Thomas Sutton, the founder of the Charterhouse, who died in 1611. This example is very singular, for on its upper part is a mask with a square Egyptian beard, as seen on the mummy-cases, having an Osirian representation.

The CHAIRMAN stated that his attention had been called by the local surveyor of the Board of Health, at Bow, to the discovery of a portion of a sepulchral slab of Purbeck marble, on digging a sewer on the site of the ancient Abbey of West Ham. He and Mr. Roberts had visited the spot and found it to be 26 inches in length, and 23 inches in breadth, giving a representation of the lower part of a Calvary cross, with trefoils and quatrefoils at the sides. The character of the work was neither pure nor good, and belonged to the commencement of the fourteenth century.

The CHAIRMAN also reported that inquiry had been made in regard to the preservation of the house visited during the Congress in 1849, known as God's Providence House, having carved in wood on its front "God's Providence is Mine Inheritance." This had been threatened with destruction, and it was intended to have had a brick front instead of the present. But by the laudable exertions of the Chester Archaeological Society this had been averted. The house is now almost down, all the back part has been taken away bodily, but the front remains. All the old oak is to be used again, and the front will be simply thrown up so as to increase the height of the row and the rooms above.

Mr. PLANCHÉ read a paper "On a Remarkable Tomb at Abington, County of Salop," which was illustrated by drawings by Mr. Hillary Davies, of Shrewsbury.

THE CASE OF ST. THOMAS'S HOSPITAL.—Vice Chancellor Wood has granted an injunction restraining the Charing-cross Railway Company until the expiration of one year from the 26th July, 1861, when the arbitration was appointed. The Company considered they were entitled to one year from when they gave the hospital notice to take the portion they then intended to take, and all they thought they were obliged to take. The case was subsequently brought before the Lord Chancellor on appeal, and, on the suggestion of that judge, it has been arranged that the Company shall be allowed to proceed with the works on the piece of ground required.

INSTITUTION OF ENGINEERS IN SCOTLAND.

At the third meeting of the session, Professor W. J. MACQUEEN RANKINE, Vice-President, in the chair, the members resumed the discussion on

VENEER-CUTTING MACHINERY.*

Mr. E. HUNT said it had been found extremely difficult to obtain reliable information permitting a fair comparison to be drawn between the two veneer-cutting machines—the German one with the reciprocating saw, and the circular-saw machine. The speed of the German machine was 300 revolutions of the crank-shaft, or 300 double strokes per minute, and the rate of feed, as tested by Mr. More and himself, about 15 inches per minute. The particulars obtained respecting a circular-saw machine were as follows:—Diameter, 10 feet; speed, 100 revolutions per minute; rate of feed, $\frac{3}{4}$ inches per revolution, or 64 feet per minute—the width cut in this instance being 7 inches. It was claimed for the German machine that it was better than the other for extra widths. It could cut up to a width of 31 inches; but, taking a width of 14 inches as an ordinary one, its actual speed of sawing was 1 foot to nearly 3 feet cut by the circular saw. The charges for cutting were the same in both cases; but being charged upon the square feet of veneer produced, there was an increased gain to the sawyer, as well as to the veneer merchant, for every extra veneer taken out of the inch. The evidence as to the number of veneers obtained per inch was very conflicting, which probably arose from the fact that it varied very largely with the kind and quality of wood. On the whole, the German machine appeared to have the advantage in this respect; in other words, it would give two or three more veneers per inch of a given thickness. As regarded the condition of the veneers produced, several inquiries had been made—from wood merchants who got the wood cut, and from cabinet makers who purchased it when cut, and used it—and the replies were generally in favor of the circular-saw machine. The reciprocating action of the straight saw appeared to roughen the surface, settling different portions of the fibres in opposite directions, and generally obscuring the pattern or grain of the wood. It was even said that this obscuration remained, notwithstanding the polishing down; but this savoured a little of prejudice. The same action was also said to loosen any of the fibres that chanced to lie across, in such a way as to permit the glue to come through and spoil the appearance.

Mr. J. RUSSELL said that at the last meeting he made some remarks from memory regarding a veneer-cutting machine, and since then he had made more particular inquiry, and was now in a position to give the data more correctly. The speed of a 15-feet circular veneer-saw in Leith mill he had given at 300 turns a minute, but he found that was 100 turns too much. The speed of two 13-feet saws was 200 revolutions per minute. There was one 17 feet in diameter, which made 100 revolutions. With a log 18 inches deep, the speed at which it cut was from 4 to 5 feet per minute, depending much, however, upon the kind of wood. With the 17-feet saw the wood travelled forward about half an inch every revolution. He had also found that about the year 1825 veneer cutting was introduced into Scotland by Mr. Burstall, from London, who erected a saw in Leith saw-mills. Mr. Malcolm Muir, then in Greenock, also got up a veneer-cutting saw about the same time, and what each gentleman was doing was unknown to the other. They ultimately became connected in developing the planing machine. He had also found that the pitch of the teeth in the first veneer-saws was very much finer than now, the pitch at present being something like half an inch, whereas, at the time he referred to, it was much finer. Mr. William Norman, by simply removing some 1,000 teeth out of one saw, thereby increasing the pitch, was enabled to do a very much larger amount of work. At last meeting he believed a remark was made by Mr. Glen to the effect, that a circular veneer-saw could not cut anything but veneers; that is to say, it could not cut boards a quarter of an inch thick. Now, he found that a circular-saw, 3 feet in diameter, got up in the same way as a veneer-saw, with a disc plate, and the edge of the saw reduced to the wire gauge 22, had cut 5,000 lineal feet, per day of 10 hours, of fir $\frac{1}{2}$ inch thick, used for orange boxes, and sent to Liverpool by Messrs. Baird and Brown, a fact which showed that the circular veneer-saw could cut wood of that thickness. With regard to cost, he had found that the 17-feet saw cost something like £200. A peculiarity in the cutting of the wood at the Leith saw-mills was, that the wood travelled above the centre of the saw, while in the machine fitted up by Mr. Muir the wood travelled below.

A paper was then read by Mr. JOHN NORMAN,

ON WOOD-PLANING MACHINERY.

Since its first introduction into this country the flooring machine has undergone various changes in design. What we may call the original flooring machine was the invention of Mr. Malcolm Muir, of Glasgow, who took out a patent for it in the year 1827. In this machine the wood being planed was led through by hooks attached to an endless chain passing over pulleys at each end of the machine, and circular saws were used for grooving and feathering the edges of the board.

The machines used before Mr. Muir's machine was introduced were very imperfect, comprising in each case only a revolving scutcher or adzing knife, the board afterwards being put on another machine for the purpose of getting the edges dressed. In these machines the board was led through by rollers driven by spur gearing, and the scutcher was placed on the top in a movable frame, and held down by weighted levers.

In 1838, Mr. William Norman, of Glasgow, applied five pairs of rollers to one of Mr. Muir's machines, for which patents for Britain were obtained, thereby doing away with the pitch chain and hooks, as great inconvenience and loss was found to exist with their use in planing thin boards, from the hooks tearing them up. Mr. Norman afterwards applied cutters for grooving, retaining the circular saws for feathering the edges of the boards. The machine upon which these alterations were made is still at work in Messrs. Baird and Brown's saw-mills, Port Dundas.

In a flooring machine, embodying all the most recent improvements as constructed by Messrs. Norman and Co., and erected by them at Alloa, there are five pairs of rollers, 12 inches in diameter and 12 inches long, driven by bevil gearing. The upper rollers are held down by springs, similar to coach springs, and are lifted to suit different thicknesses of wood, varying from $\frac{1}{2}$ -inch to 4 inches, by means of screws turned by hand wheels. Each screw works in a nut formed on a buckle or strap passing round the under side of the upper roller and bearing in a recess cast in the standards. The bushes of the under rollers are put in from the under side, and are held in position by malleable iron plates, and are

adjusted by screws. This arrangement makes the under rollers very easy of access, all that is required to get out the rollers being the removal of the malleable iron plates. The plane bed in this machine is of the usual form, having three irons, which have in plan an angle of 45 deg. In some machines, however, the bed is east separately and the plane irons are placed in a movable box. The cutter heads are formed with three short arms, each being furnished with cutting irons for grooving and feathering the edges of the board. The cutter heads are adjusted to the required breadth and thickness of flooring by screws. The thickening scutchers consist of a pair of revolving cutters or knives, fastened to two sets of malleable iron arms, and adjusted by thumb screws. The scutcher is adjusted for different thicknesses of wood by screws connected by a shaft passing across the machine, and with bevil wheels worked by a hand wheel.

The main driving shaft is fitted with pulleys for driving the feeding rollers at two speeds, 30 and 46 feet per minute, and also with a pulley for driving the cross shaft at the end of the machine, on which last are the pulleys for driving the grooving cutters and thickening scutcher. The grooving cutters make 3,000 revolutions per minute, and the thickening scutcher 2,500 revolutions per minute. This machine has been in operation for the last twelve months, giving the greatest satisfaction, being able to turn out 1,300 yards of flooring per day.

A drawing was shown of a machine erected at Mr. Fauld's works, Glasgow. This machine was originally constructed for planing wood, but was afterwards altered so as to be able to plane flooring. The additions made were a pair of cutter heads for grooving and feathering, and a thickening scutcher, which will account for the apparent want of arrangement of the parts. The object in view in bringing forward this machine was to show that, under ordinary circumstances, two pairs of rollers can be made sufficient to lead through the wood to be operated on. The original machine consisted of two pairs of rollers, 20 inches in diameter and 13 inches long, the upper rollers being held down by springs similar to those already described, and driven by bevil gearing. The plane bed is in the middle of the machine, and over it there are placed three pressing rollers, kept down on the upper side of the board by springs. This machine will plane up to 4 inches thick, and at the rate of 36 feet per minute.

DERBYSHIRE IRON.

At a dinner celebration of Messrs. Eastwood and Sons, on the occasion of the erection of large rolling mills, at Derby, Mr. Hedley, Government Inspector of the district, gave some interesting statistics. He said upwards of 4,000,000 tons of iron are made annually, over 20,000,000 tons of coal being consumed in the manufacture of the same. Iron making in the Midland Counties was confined to Derbyshire, where 130,000 tons are annually made, consuming 700,000 tons of coal; fifty years ago the make was only 12,300 tons annually. The iron of Derbyshire is used for railway and other purposes where body and tenacity are required; and this iron will bear comparison in quality with iron made of the materials of any other coal field. Derbyshire iron has been subjected to many severe tests, two or three of which he mentioned. Some time ago many makes of pig iron were tested at Woolwich Dockyard, when the iron of Messrs. Whitehouse and Sons, of the West Hallam Works, Derbyshire, bore the greatest breaking strain. Last month, an armour plate $\frac{1}{2}$ inches thick, manufactured by J. Brown and Co., of the Atlas Steel and Spring Works, Sheffield, of a mixture of cold and hot blast iron, made by Messrs. Fowler and Co., of the Sheepbridge Works, near Chesterfield, was tested at Portsmouth, and stood a test unsurpassed by any armour plate yet submitted to a test. The Butterley Company have long had a character for superior make of bars, plates, sheets, &c., and they are now rolling the largest masses of iron into girders, &c., of any firm, for girders for our large war steamers. Mr. Barrow, of Staveley, makes several hundred tons of castings weekly; from the largest pipes, girders, and columns, down to the smallest. To show the energy of this gentleman, and the extensive mechanical appliances at his command, he has recently completed an order for 4,000 tons of girders and columns, &c., for the Great Exhibition building. The patterns were made, the column ends turned in the lathe, and the castings completed in three months, without interfering with the ordinary work. He has now in hand an order for two miles of railings for the galleries of the same building. Messrs. Oakes, of Alfreton Ironworks, have for a long time maintained a character for superior material and workmanship in their extensive casting business, which embraces castings of every description. All these gentlemen work Derbyshire iron, and there is plenty of material on the ground to work it for 50 years to come. The mining operations of Derbyshire afford employment to above 5,000 hands, in producing materials for iron making, and about 18,000 hands are employed in producing all the coals and ironstone of the county.

MEMORIAL TO ROBERT STEPHENSON IN WESTMINSTER ABBEY.—During the process of cleaning which the Abbey has undergone for the last month a brass has been let into the floor of the nave, about midway between the western door and the choir screen, to the memory of the late Robert Stephenson, who was buried side by side with Telford in that spot. The memorial is of Cornish granite, and weighs 2 tons 2 cwt. The brass is a figure of Stephenson, who is represented in plain clothes, his arms folded across his breast. The inscription round the figure is—"Sacred to the memory of Robert Stephenson, M.P., D.C.L., F.R.S., &c., late President of the Institution of Civil Engineers, who died 12th October, A.D. 1859, aged 56 years." The brass is by Messrs. Hardman, of Birmingham.

ACCIDENT AT THE EXHIBITION BUILDING.—On Saturday morning, whilst a smith, named Richard Gale, was driving in the rivets of one of the girders of the Exhibition building with a sledge-hammer, William Powell, his assistant, suddenly raised himself to an upright position, and received the full force of the blow intended for the metal on his head. The unfortunate man's death was instantaneous, his skull being shattered to atoms.

DUBLIN.—Alderman Drummond, has offered to give £10,000 towards the erection and endowment of an institution for the training and educating of soldiers' children, if the Government give a similar sum, and the public raise by subscription a third £10,000. Alderman Drummond proposes to make it a counterpart, in working and design, of the institution for educating soldiers' boys in Phoenix-park.

* See page 51 ante.

CHURCH BUILDING.

Kington Church.—This fine early church, which withstood the rude use to which it was put by the Parliamentarians as a stable in the seventeenth century, has just been reopened, after having undergone extensive restoration and enlargement since 1857. The reseating and restoration of the chancel and private chapel was carried out by Lord Daere; the reseating of the nave and south aisle followed, through the exertions of the Rev. Frederick Sullivan, the vicar, with extensive works in repairs, and the restoration of the internal walls and stonework, which was very much mutilated, and, in parts, unsafe. The old screens, with the chancel seats, are restored, and every point of interest has been carefully preserved. The walls were formerly richly decorated with paintings; the Seven Acts of Mercy, which were found, unhappily could not be preserved; but some earlier work at the east end of the chancel was discovered, and remains in an almost perfect state. The Parliamentary soldiers defaced with thick coats of whitewash all the colored decorations; and over this, under the soffits of the arches, they stencilled in oil color the different characters of their playing cards, and, even now, faint outlines can be traced of aces, clubs, hearts, and spades, which have so sunk into the walls as to defy removal without waster destruction. The Commandments, as originally directed by the Canon of Elizabeth, were found over the chancel arch, and a few of the original encaustic tiles remained; the latter are relaid, and the patterns preserved in the new tiles. The remains of a very singular supposed cist, containing bones and wood, was found in the churchyard, formed of embossed tiles, filled in with color of good design, somewhat resembling majolica ware. The wants of the parish requiring an increase of accommodation, a new aisle on the north side of the church has been built. Much remains yet to be done to the walling; the whole of the external masonry is in a sad state of decay. The chancel and nave are covered with flat modern roofs, plastered underneath, whilst the south aisle roof, which is a good specimen of Perpendicular work, has undergone as much repair as it will bear. In order to obtain light over the accumulation of the earth and the rising ground behind, and to secure pitch enough for the tile roof, it was necessary to carry up two gables in the north wall, which are each filled with windows of three lights, and two smaller windows between; a two-light window fills the east wall. The roof of this aisle is of fir; it is enriched with carving, stained. The pulpit and prayer-desk are of oak. A new font has been added, and the tower arch enclosed by a screen. The work has been carried out under the direction of Mr. Joseph Clarke, diocesan architect, by Messrs. Warren and Son, contractors, of Ilitchin.

Crayford Church, Kent, was re-opened on the first of the new year, after an extensive restoration and reseating, also under the direction of Mr. Joseph Clarke. This church was before restored by Sir Cloudestley Schovel, the famous Admiral—a great fire happening in his time, doing considerable damage, and leaving traces which were found in prosecuting the present works. Originally a Norman church existed on the site, with conventual and other ecclesiastical buildings around it, the foundations of which were found and remain under the present floors. It was then, no doubt, a church of the usual arrangement, with a nave and aisles; but in later times these disappeared, and the space between the outer walls, north and south, was equally divided, and a third-Pointed arcade built, thus forming two naves. The original third-Pointed chancel—of which portions remain—was left, with the singular and almost unique arrangement (in England, at least) of a central row of shafts, with the last half-arch of the arcade dying or butting on to the wall over a low depressed chancel arch. Considerable traces of the original work remain, and these have all been carefully preserved. Very few traces of color were found; but some curious models of small shafts, with bases and caps, in gypsum or a coarse kind of plaster; of early third-Pointed work, turned on a lathe, were found built in in the centre of a third-Pointed wall. They appear to have been used as a guide to the workmen in cutting the original masonry, as is supposed, of the sedilia. The greater part of the internal masonry has been restored, and the whole church, including the Draper and south chapels, reseated with substantial and solid benches. The floors have been properly levelled. All the vaults, of which there are many, are carefully ventilated by a series of pipes carried through the walls, and the whole surface covered with concrete. The masonry of the east window is new, and filled with stained glass by Ward and Hughes. Another window in the north aisle is filled with glass by Clayton and Bell. A new font has been presented, and nothing has been spared to make the church perfect. Price and Co. were employed for the heating; and a new clock, by Benson, has been added. The gas-fittings are by Skidmore, carried out in a novel and efficient manner. The cost of the works will amount to £1,500; they have been executed by Miles and Melton, of Dartford. The exterior of the church, with the roofs of the double naves, are left for future restoration.

Huntingdon.—*All Saints*, a very fair specimen of the later sixteenth century churches, is undergoing extensive repairs. The old roofs of both nave and chancel have been entirely removed, and replaced with new; the south aisle has been pulled down and rebuilt, and a new organ chamber on the north side of the chancel added. The old galleries have been all pulled down and cleared away. Already more than £2,000 have been expended, and the whole of the seating, &c., has yet to be done before the works will be completed. The work has been carried out under the superintendence of Mr. G. G. Scott. —*St. Mary's*, which is also a church of about the same period, and which possesses a very good tower, is also undergoing restoration. The whole of the church has been re-pointed externally, and the windows on south side of chancel, which for many years have been blocked up, re-opened. The old pulpit and reading-desk, which are in the worst style of Italian architecture, of about the beginning of this century, are to be cleared away, and new ones substituted of appropriate design. The work is being carried out under the superintendence of Mr. Robert W. Edis, architect, of London and Huntingdon.

IMPROVED PICKAXE.—A new kind of solid pick is at present being manufactured by Messrs. Yates and Co., of Birmingham. The pick has no eye to it, and is so constructed that the handle can be fitted on in an instant, and when a pick is detached for repairs another of the same weight can be instantly put into the handle, even by a boy. The handle has a strong iron socket, into which the pick slips, and is keyed fast with a steel key. It is claimed that the amount of labor in using the new pick is much less than usual—the laborer being able to stake a much quicker and stronger blow without jar to the hand or risk. The pick is in use in the American army.

DECISIONS IN THE COURTS.

ARCHITECTS' CHARGES.

Broadbridge v. Treadwell.—*Court of Queen's Bench.*—This was an action to recover the sum of £50 15s. The defendant pleaded never indebted except as to £26 9s. paid into court.

The plaintiff is an architect, &c., carrying on business in Laurence Pountney-lane, and the defendant is proprietor of the Antelope, situate in Finsbury. The Antelope public-house is the property of the Ecclesiastical Commissioners. The defendant was desirous of making certain alterations, of putting the premises into repair, and erecting buildings in the rear, at an expense of about £500, provided he could get a renewal of his lease, which would have expired in 1867. The plaintiff was employed by the defendant to negotiate a further lease with the Ecclesiastical Commissioners, and to superintend the work required to the premises. He obtained the lease at a reduced rental, and made the drawings, &c., for the repairs, but before they were completed the defendant declined to employ him any longer. The question was as to the term of agreement between them. It was urged by the defendant that the plaintiff was to have two guineas for his trouble if he was unsuccessful in obtaining the lease, and, if successful, he was to have the carrying out of the work at 5 per cent. The plaintiff, however, charged now twenty guineas for obtaining the lease, £35 for superintending the repairs (which amounted to £529), and several items, making up the demand claimed by him.

The jury returned a verdict for the plaintiff for £10 10s. over the amount paid into court.

CASES UNDER THE BUILDING ACT.

Works to Buildings Demolished to half their Cubic Contents.—On the 28th January, Mr. J. H. Parkinson appeared before Mr. Woolrych, Thames Police Court, at the instance of Mr. E. Woodthorpe, District Surveyor, of Limehouse, to answer a complaint that, in rebuilding certain premises at the corner of Phoenix-place and Ratcliff-cross, he used a party wall which was of insufficient thickness on the ground floor, and raised the same of the height he required in 4½-inch work; that he built a wall in extension of this party-wall of the same insufficient thickness, contrary to Section 12 and to Schedule 1; that he built wood plates in the old party-wall, and allowed the ends of the joists to have a bearing on such wall at a nearer distance than 4½ inches from the centre thereof, contrary to Section 15, Rule 2; and that he fixed the woodwork of the shop-front nearer than 4½ inches from the line of junction of adjoining premises, contrary to Section 26, Rule 3.—The defendant, who appeared in person, stated that he considered the works executed by him to be merely a repair, the works being caused by the former premises being destroyed by fire. It was proved by the District Surveyor that the premises were demolished to more than half their cubic contents, and Mr. Parkinson was ordered to amend the whole of the irregularities within eight weeks, and to pay the costs.

Temporary Structures.—Mr. Stephen Peters was also summoned by Mr. Woodthorpe, for inasmuch as he had greatly extended and altered a wooden erection situate in the Commercial-road, Limehouse, without giving forty-eight hours' notice thereof to the District Surveyor, as required by the Act (Sec. 38). Mr. Woodthorpe stated that the building was originally placed upon wheels to evade the requirements of the Act, but that on the 18th January he discovered that alterations and additions had been made, and that the building had been rendered in a measure permanent by the introduction of wooden uprights or quarters let into the ground and supporting the roof, the sides being covered with weather boarding and canvas. He considered the building in itself dangerous on account of the inflammable nature of the material used; and further, that the danger was increased by the purposes for which the building was used—viz., a rifle gallery. The defendant pleaded ignorance of the Act, and the case was adjourned for four weeks, at the Magistrate's suggestion, to allow the defendant the opportunity of applying to the Metropolitan Board of Works for their permission for the structure to remain temporarily.

THE PROPOSED NEW BLACKFRIARS BRIDGE.

LAST Thursday the Court of Common Council held a special meeting for the purpose of taking into consideration the report by the Bridge House Estates Committee, having reference to Blackfriars-bridge, and recommending that a new bridge, of three arches, be erected, after the designs sent in by Thomas Page, Esq., at the estimated cost of £245,000. The Right Hon. the LORD MAYOR presided.

Mr. H. W. VALLANCE, the Chairman of the Bridge House Estates Committee, in moving that the report should be agreed to and adopted, referred at some length to the previous proceedings that had taken place in reference to the question, and said that even those who had an interest in "nursing" the question admitted that it was no longer advisable to maintain the old structure—(Hear, hear). The matter was referred to the Bridge House Estates Committee in March, 1861, and they considered the subject very carefully, and consulted the most eminent engineers that this country could produce, who had been selected by the City architect, and after the most careful consideration, they had almost unanimously agreed to the report that had been presented, and which, he hoped, would receive the sanction of the court. He said he believed that the real question that was to be decided was whether they were to have a bridge of five arches, which would suit the convenience of the London, Chatham, and Dover Railway Company, or whether they were to have one of three arches, which would afford much more waterway and considerably greater accommodation to the traffic of the river—(Hear, hear). Mr. Vallance then proceeded to call the attention of the court to all the points connected with the question at issue, and concluded by stating that neither he nor the Committee had any other object in view than that a bridge should be erected in the place of the present inconvenient and dangerous structure that would be an honor to the Corporation of London, and would comply with the requirements of the age in which they lived.

Deputy FRY proposed as an amendment that the matter should be referred back to the Committee for further consideration.

Mr. KEARNS supported the amendment, and in doing so, denied that the Committee had had sufficient opportunity of considering all the plans that had been presented to them, and he said that he was shocked to find that the Committee had come to the resolution to accept the plan that had been sent in by Mr. Page—(Oh, oh). So far from his having consented to this proposition, he moved two amendments to the motion and divided upon them, and these protests were upon the records of the Committee. He then proceeded to complain of the proceedings that had been adopted to obtain signatures to petitions in favor of a three-arch bridge, and cited some instances in which parties' names appeared who were unable to write, and entered into details in support of his argument, and concluded by expressing a hope that the court would not sanction the expenditure of a sum of £300,000, which in all probability would be the expense of the proposed structure, without first being well satisfied that when it was completed it would answer the purpose for which it was erected—(Hear, hear).

Several hon. members then rose to address the court, but

The LORD MAYOR interposed, and said that the question before them was one of very considerable importance, and it was not likely that the matter could be brought to a conclusion that day, unless they sat to a late hour; and he therefore suggested that the further discussion of the subject should be postponed.

The court unanimously agreed to this suggestion, and the debate, therefore, was adjourned for a fortnight.

THE EASTERN COUNTIES AND EAST ANGLIAN RAILWAYS.—The negotiation between these two companies is off. *Herapath's Journal* says that the minimum offer of the Eastern Counties is quite microscopic, and would require a high magnifier to the best of eyes to discover its annual increase.

FALMOUTH BREAKWATER.—The breakwater at Falmouth has been carried out to a length of 1,028 feet. The excavation for the second graving dock, 400 feet long, with entrance 65 feet wide, and to have 16½ feet of water over the sill at ordinary spring tide, is being rapidly proceeded with.

THE ART OF MEASURING.

AT a meeting of the Glasgow Architectural Society, held on the 20th of January, Mr. JAMES HOWATT, honorary treasurer to the society, read a paper on the "Art of Measuring and its Practical Bearing on those Concerned," chiefly with reference to Scottish practice.

After a few introductory remarks from the CHAIRMAN, Mr. HOWATT proceeded to say that the art of measuring was an ancient and honorable occupation, and that those who follow it ought to do so with integrity, honor unimpeachable, and the most careful and laborious accuracy. Some men scouted the need of a measurer, and declared the fees paid to him as lost money, which was a mere cobweb covering a great truth. This idea should never be held by those about to build, as the employment of a measurer was the cheapest method of executing a difficult problem and the surest method of arriving at truth. Another cobweb that might be easily brushed away was a feeling on the part of many that the duties of a measurer were very simple, and might be accomplished by anyone. "And it is not only the ignorant but the would-be wise who act upon this assumption." Mr. Howatt gave instances of inaccurate measurements to illustrate this part of his subject, and then proceeded to demolish another cobweb, which consisted in the assertion sometimes made, by those who seemed to be utterly ignorant of the amount of labor expended on measurements and estimates, that the fees were too large. He spoke advisedly when he said that many pieces of work did not pay the actual time employed on them, much less remunerated them for the years of preparation and expense necessary to qualify a measurer for his duties, while in no case were they more than adequately remunerated. Without entering into details he would say that, in his opinion, the duty of a measurer in preparing estimates was to lay down broad and well-digested principles, which he must carefully and consistently carry out, and not, as in a schedule which very recently came under his observation, to have one principle for measuring a front wall and another for measuring a back wall. Were this done they would not have tradesmen saying that they must know the measurer before they could know the mode of measurement. Again, he (Mr. H.) held that, in preparing his measurement, a measurer must use the same care that the principles of the estimate be accurately carried out therein. He would also urge on all engaged in the profession to study, with as much care as was compatible with their other duties, the styles and beauties of architecture, as they would thus be enabled to realise the creative genius of our talented architects, and more easily understand the sometimes very limited explanations tendered to them as specifications. A kindred feeling ought to exist between architects and measurers, from the close connexion of their duties; and a like feeling of respect should exist between measurers and contractors, neither the one nor the other usurping a position he is not entitled to hold. Finally, on this head, he would say to all—architects, measurers, and contractors alike—in their dealings with each other, "be courteous."

Mr. Howatt then brought under the notice of the society the necessity of having for every building of any importance detail plans and a specification, which it seemed to him, were quite indispensable to a proper and correct estimate. They all knew what mischief occurred when measurements exceeded estimates to any large amount, and the consequent difficulties in settlement. Sometimes they had plans so small and minute, that the sundry lines (say in a cornice) must bear an unheard-of weight of interest; and the stating a size and girth for these puzzle the most astute measurer. Yet according to such size and girth only was the contractor bound. The architect sometimes consulted these, and made his details to correspond therewith; but oftener, without any reference to them, he set his brains to work and made out the most elegant moulding he could. Now, were detail plans furnished for the more important parts of the work, this would in great measure be avoided, and the constant outcry for heavy material in place of the lighter material supposed by the contractor to be required, would be put down at once, and the tantalising examination of blue ink prices very much avoided. He was aware that this was not always the architect's fault; he knew that some proprietors were unreasonable, and demanded plans which would require to be got up by types and steam, instead of by the creative genius of the brain and pencil. Nevertheless, if they (architects) set themselves to demand time for the proper execution of their work, and to show the loss proprietors would sustain by not having proper detail plans and a specification, they would gradually get this matter fixed in the public mind as something conducive to cheapness and comfort. Cases of violation of good taste in buildings, as well as the marring of particular forms consonant to the period the building is intended to represent, result from this, not from any want of ability, but from want of arrangement at the commencement of the work. Moreover, this careful preparation of the plans would render unnecessary the great changes often introduced into buildings, which often placed measurements and estimates in contrast to each other. The terms used in specifications should also be clear and well defined.

After throwing out some hints unfavorable to the employment of incompetent measurers, Mr. Howatt came to deal with the question of "no after-measurement." There were many difficulties to contend with in preparing an estimate from plans. These plans were of necessity to a small scale, and many times did not exhibit details which were included in the estimate. Besides, changes invariably occur in the plans requiring after-measurement; the foundation is often deceptive, causing further changes. No doubt there are notable cases of uniformity between estimate and measurement, but it is the exception, not the rule. Then the contractor, if a wise man, will, in the case of "no after-measurement," add a sum to his offer to cover contingencies—this is not required where the work is measured after completion; but one great objection to "no after-measurement" was that it induced, on the part of the contractor, a nigardliness of material and workmanship that was plainly prejudicial to the work, as everything he could save was clear gain to him; while, in the other case, all contractors knew that any little more or less than the quantity provided in the estimate would be re-measured, and the value given. He had, therefore, no inducement to scrimp materials and work, being assured that the "middle-man" would give him what was the true meaning of the estimate in his after-measurement of the work. Nothing could be more honorable, as between man and man, than a carefully-prepared measurement, priced upon the basis of the estimate. In conclusion, he hoped that his brethren, and especially the architects, would receive these remarks in the kindly spirit in which they were given. It might be long ere such another opportunity might be afforded to measurers of drawing the notice of those whom, as a body, they respected to the small difficulties referred to above, and the removal of which would be a great advantage to both. This he knew, that the kindness received from many architects would never be forgotten by some of the measurers, and that the friendships of life had been much enhanced by the brotherhood of spirit manifested towards them.

THE BREAKWATER AT PLYMOUTH.—The works connected with the fortifications on the western side of Plymouth Sound have been considerably damaged by the late storms. The contractor's road, tramway, and landing-place, under Picklecombe Fort, Mount Edgecombe, have been washed away.

STEAM ON COMMON ROADS.—On Tuesday last, a heavy marine hoiler was successfully removed from the works of Messrs. John Laird, Sons, and Co., Birkenhead, to the large crane situate on the margin of the Great Float, by means of "Taylor's steam elephant," and a second boiler was removed on Friday. This is the first instance in this neighbourhood in which steam on common roads has been employed for such a purpose. Judging from the easy manner this machine was guided over the roads, it promises to become a most useful agent for transporting heavy loads, and it is equally applicable for discharging timber out of ships and afterwards drawing it upon the quay or from place to place, as required. One of these engines, manufactured by Messrs. J. Taylor and Co., of Birkenhead, has, we understand, been at work for this purpose in her Majesty's Dockyard, at Devonport, for upwards of two years, with great success.—*Liverpool Mercury.*

Correspondence.

THE MEMORIAL TO THE PRINCE CONSORT.

SIR,—There is too much reason to fear that we are about to fritter away once more a great opportunity for art-display. It is impossible to read the varied proposals as to the character of a memorial to the Prince Consort without feeling apprehensive that, when the nation has liberally poured forth its money, dissension between artists and dilettanti will have reached such a pitch as to compel the adoption of some wretched compromise.

Of all the ideas put forth, that broached by "Miles" in the columns of a daily paper, is the most extraordinary. His suggestion is insidiously framed so as to give any opposition the appearance of going counter to the wishes and feelings of the deceased Prince. On looking more closely into it, however, we detect, under this mask, the first move of the Gothic school of architecture. The obstinacy with which a Gothic design for the Foreign Office was fought for in Parliament, is fresh in our memory. By some, indeed, the question is thought to be not settled even yet. Stripping sentiment from the letter of "Miles," we find these two points:—

1. Prince Albert saw, and was much pleased with, a suggested design for the Guards' Memorial, in the shape of a cross "in a truly English style," and offered a site for its erection in Hyde-park, where stood till lately the circular reservoir.

2. The sketches for this cross are, doubtless, in the portfolio of the architect, and, with a little alteration, might be made suitable for the proposed monument to the Prince.

On the first point I need only remark that his Royal Highness had not, power to offer, as of himself, a site in one of the public parks, because they are under the control of the Chief Commissioner of Public Works, who is directly responsible to Parliament. "Miles" would have us understand that when Prince Albert saw the design as now executed, he withdrew his permission and countenance.

2. It would be in the highest degree derogatory to the memory of the late Prince to adapt a design made for another purpose—to cook a *rechauffé* of the ideas of any artist, however eminent. But the sketch, if suitable as a memorial of soldiers who died (of hardships and) fighting for their country, would be manifestly unfit to record a Prince whose triumphs were won, not in war, but in peace. The two most antagonistic principles in the universe could not be represented by the same material form. It is not difficult, I think, to guess what the "truly English" monument was,—a repetition, on a larger scale, of the well-known crosses of Queen Eleanor. It is this turning to precedent, this clinging to the skirts of antiquity, that cramps the freedom and impedes the progress of art. Individual architects can be detected in their works by a predilection for particular buildings with which, at an impressive period of their lives, they appear to have been so struck as never fully to recover from their effect. Thus the great Campanile at Verona, Libreria Vecchia at Venice, Palazzo Pandolfini and Farnese, Alhambra, Ospedale Maggiore, at Milan, Salisbury Cathedral, Norfolk flint churches, and others have, in turn, so inoculated the blood and affected the brain as to be always struggling to reveal themselves.

The whole discussion may be pronounced somewhat premature; but, having been raised, and as the national subscription is daily gaining volume, it may be well to consider whether, in minor provincial towns, the subscribers for a local memorial had not better apply such funds as they can raise to the metropolitan monument. You, Sir, have ably pointed out, both lately and in the case of Lord Herbert, how necessary it is to have a statue, a visible embodiment of the man. Let us then, have the statue, but (in such a climate and atmosphere as ours) lovingly covered and protected from the weather beneath a dome—polygonal—whose sides shall be painted in compartments, depicting scenes in the public life of the Prince Consort. Let us combine the arts of painting, sculpture and architecture in a grand impressive work, and thus ally all artists in a common bond. Some such edifice, placed on a flight of steps, with ample access and entrances, would hold a large number of persons. Its form would allow free passage and circulation, and its massive exterior would proclaim to the most ignorant a national temple raised to the memory of a Prince and a great man.

C. J.

THE PROPOSED BRIDGES AT BLACKFRIARS.

SIR,—You have lately once or twice alluded to the proceedings respecting Blackfriars-bridge and its proposed reconstruction.

It is, no doubt, a very important and somewhat difficult matter to determine how far the different requirements of railway and ordinary traffic can be accommodated without disfigurement to the Thames or the streets, and also with the least possible interference with the tidal action of the river.

All obstructions in the bed of the stream should be carefully avoided, and, should the Thames embankment ever be carried out, the abstraction of so much superficial area from the river will render it of the highest importance that the new bridges with which Father Thames is threatened should crouch by means of piers, &c., as little as possible upon his waterway.

How some engineers consider the appearance of their structures or those of their professional brethren, may be seen in the two bridges spanning the Medway at Rochester. The first erected bridge is really a handsome structure, but its effect, look at it from what point you will, is completely ruined by the hideous tube the railway people have erected alongside it.

How the citizens of Rochester could tamely allow such a monstrosity to be put up, or the engineer have the heart so to mar his predecessor's work, is beyond my comprehension; but a very useful lesson may be learnt from it by the citizens of London if they have the wisdom to profit by it, in not allowing their new bridge at Blackfriars to be put out of countenance by that for the railway. If Mr. Page's design for Blackfriars be ultimately adopted, and, as he is a man of taste as well as skill, I hope it may, could not some arrangement be come to by the Bridge House Estates and the railway to assimilate their structures, unite the useful with the picturesque, and out of two dissimilar works form an harmonious whole, which would really ornament the city, accommodate the traffic, and put no more obstructions in the bed of the river?

CIVIS.

THE SUPPLY OF PURE WATER TO THE METROPOLIS.

SIR,—My attention has been drawn to the subject of "artesian wells," on which a paper and discussion has been brought before the Society of Arts. There can be but one general opinion that the subject of "artesian wells" is in its infancy, and that it is only by bold, resolute experiments we shall arrive at good results. A good deal of prejudice naturally arises to keep these "artesian wells" from being developed as they ought; for as long as companies can pump out of the river Thames they will do so, although "death may be in the pot every time it is filled;" for it is certain "the more population increases the more foul must be the waste streams," and until some other supply is furnished the river must be the only resort and resource.

That "artesian wells" enough to supply ten times the population can be sunk in the metropolitan district cannot be doubted, for the quantity of rainfall can be easily calculated, and how much is retained in the absorbent sands.

The great points are to ascertain where are the best positions for sinking, and then to do so effectually, not by going down 1,300 or 1,400 feet, and stopping, when 200 or 300 more would have realised the object sought for—"plenty of water." Good sinking of permanent curbs, and boring afterwards with real good borers, would soon draw up such good water and abundance for every one; but perseverance must be used. And supposing, after all, that all the wells were failures, which they would not be, but very probable all successes, it is certain, on the testimony of Dr. Normandy, Mr. R. Hunt, and others, that plenty of good wholesome water could be obtained by drawing salt water from the sea through sand filters of from 20 to 40 feet thick into deep shore reservoirs or basins, from whence a supply inshore could be drawn for the general use and consumption.

It is most certain a vast degree of disease and sickness is now consequent to the impurity of London drinking waters, and these are getting worse instead of better. Something must be done to remedy this great evil.

Southsea, Feb. 4, 1862.

W. AUSTIN, C.E.

TENDERS.

DWELLING-HOUSES, FOREST-GATE.

* For erecting a house at Forest-gate, Essex, for J. Littlefield, Esq. Mr. S. W. Iron, surveyor, Mile-end.			
Jacobs	£325	J. and W. Smith	£470
Hennings	480	Larke	457
Sergeant	479	Rivett	451
Read and Son	473		

For completing five houses at St. Johns-wood for the Temperance Permanent Land and Building Society.

G. Gumnow	£681	0	6	J. Potter	£500	0	0
J. Chamberlain	655	12	0	J. Shilton	480	0	0
J. Fawcett	585	0	0	J. Richards	479	0	0
J. Nutt	552	0	0	B. Cordwell (accepted)	420	0	0

For erecting a house for H. D. Cuff, Esq., at Forest-gate, Essex. Mr. S. W. Iron, surveyor, Mile-end.

Jacobs	£540	J. and W. Smith	£467
Sergeant	493	Rivett	462
Hennings	490	Larke	457
Read and Son	483		

CHURCH, YORKSHIRE.

For the rebuilding of the parish church of the Holy Trinity, Startforth, Yorkshire. Messrs. W. and J. Hay, architects. Each party took out his own quantities.

Marrin	£1,629	Robson	£1,335
Applyby and Carter	1,580	Jones	1,306
Applyby	1,500	Borrowdale	1,275

HOUSE AND SHOPS, STRATFORD.

For building three houses and shops for Mr. Josias Pidgeon, in the Grove, Stratford, Essex. Mr. John M. Dean, architect, Stratford. Quantities supplied by Messrs. Hovenden and Heath.

Reed	£1,769	Hedges	£1,448
Rivett	1,643	Ennor	1,439
Wood and Son	1,500	Perry (accepted)	1,395
Case	1,477		

SCHOOLS, HANWELL.

For alterations at the Central London District Schools, Hanwell. Quantities not supplied.

	Internal.	External.	Total.
Batley	£210	£375	£585
Clements	207	220	427
Child, Son, and Martin	190	203	393
King	178	146	324
Reynolds	174	128	302

COMPETITIONS OPEN.
BRIDGE.

BRISBANE RIVER.—The Municipality of Brisbane are prepared to receive designs and tenders for the construction of a bridge over the Brisbane river, at Brisbane, the capital of Queensland. The author of the best design, at the lowest cost, will receive a reward of £150, or be employed to carry the work out, providing he furnishes sufficient proof of his competency and experience in similar undertakings. A premium of £80 will be awarded to the next best design, and £40 for the next best. The plans, specifications, and estimates of the first and second designs will be retained by the Corporation as their property. The remainder will be returned to the competitors; but the corporation will incur no responsibility as to their safe delivery. Each set of drawings, and the documents accompanying them, are to be distinguished by a motto only, and accompanied by a letter in a sealed envelope, marked with the same motto, and containing the author's name and address, and such testimonials as he may think proper to furnish. Professional judges, being non-competitors, will be appointed by the Corporation to determine the merits of the respective designs. Eligible tenders for the work, accompanying the design, will be entertained. All drawings and tenders to be delivered at Gresham House, on or before the 15th of March next. Copies of the instructions to competitors, and the plan of the city, can be obtained of F. Mangies and Co., the Colonial agents, and agents to the Municipality of Queensland, 86 to 88, Gresham House, Old Broad-street, London, E.C.

DRINKING FOUNTAINS.

CLERKENWELL.—Designs are required for street fountains, accompanied with prices, for the Committee of Works of the vestry of the parish of St. James and St. John, Clerkenwell. Address, Robert Paget, vestry clerk, Vestry Hall, 23, Upper Rosoman-street, E.C.

CONTRACTS OPEN.
HOSPITAL.

DEVONPORT.—For the erection of the Devonport Stonehouse, and Cornwall Hospital, at Devonport. Drawings, &c., with Alfred Norman, architect, Ker-street, Devonport, until the 22nd February, where tenders, sealed, and endorsed "Tender for Hospital at Devonport," must be delivered not later than eleven a.m., on the 24th February.

CATTLE MARKET.

COLCHESTER.—For the formation of the New Cattle Market, in Colchester. Plans, &c., at the office of James Cooke, Esq., C.E., Colchester. Tenders, under cover, addressed to S. Turner, town clerk, Colchester, on or before the 17th Feb.

WAREHOUSES.

LEEDS.—For the erection of three first-class woollen warehouses, in King-street, Leeds. Plans, &c., at the office of Mr. Cuthbert Brodric, architect, 2, Park-place, Leeds, to the 10th February. Bills of quantities will be provided for parties requiring them. Sealed tenders, addressed to "The Directors of the Leeds King-street Warehouse Company, Limited," to be delivered at the Company's office, 1, Bond-place, Leeds, not later than February 12.

CHURCHES.

PEMBROKE.—For the proposed restoration and reseating of the parish church of Nevem, near Newport, Pembroke-shire. Drawings, &c., with Mr. David Phillips, schoolmaster, Nevem, to the 12th Feb. inclusive. Tenders prepaid, addressed to the architect, Mr. R.J. Withers, 51, Daughy-street, London, W.C., of whom further information may be obtained, by Feb. 13.

CHESHIRE.—For the works to be done in a new church at present in course of erection at Waterfoot, near Newchurch, Rosendale. Plans, &c., at the Duke of Buccleugh Inn, Waterfoot, on application to the Rev. R. Smith, Glen House, near Newchurch Station. Tenders to be delivered to James Crabtree, Esq., Newchurch, on or before 10th February, 1862.

DUMFRIES (N. B.).—For executing the mason, joiner, plasterer, slater, and plumber works connected with the Free Church to be erected at Kirkmichael, Dumfriesshire. Plans, &c., with Mr. Blues, farmer, Dalruscan, Thnwald, with whom sealed tenders are to be lodged before 11th Feb.

BRIDGE.

IRELAND.—For building an iron bridge over the river Fergus, at Ennls. Plans, &c., at the office of the secretary of Grand Jury for the county of Clare. Tenders, sealed and endorsed, "Tender for Iron Bridge," and directed to the secretary of Grand Jury, co. Clare, by Feb. 13.

COASTGUARD STATION.

LINCOLN.—For the erection of a coastguard station at Oliver's Gap, Theddlethorpe, St.

Helen's, Lincolnshire. Drawings and specifications at the Coastguard watch-house, Saltfleet, or at the Admiralty Coastguard office, 12, Spring-gardens, London, S.W. Tenders to be sent to the latter office by 12 noon, 10th February, under seal, and directed to the Commodore Controller General of Coastguard, and endorsed "Tender for Oliver's Gap Station."

MILITARY WORKS.

LONDON DISTRICT.—For works and repairs at the undermentioned stations, separately or otherwise, from the 1st of April, 1862, to 31st March, 1865, inclusive, viz.—London, comprehending the Tower of London, all the barracks and other buildings within five miles of that place, and Turnham-green Militia Barracks; Croydon (and Carshalton Barracks; Hounslow, Hampton Court, and Kneller Hall Barracks, and Richmond Militia Barracks; Windsor Cavalry and Infantry Barracks, and Belvedere Fort; Militia Barracks; Barnet; Militia Barracks, Hatfield; Militia Barracks, Uxbridge. Schedules and printed forms of tender, price 7s. 6d. each, and all necessary information, on application at the Royal Engineer Office, 11, James-street, Buckingham-gate, London, S.W. Sealed tenders will be received at the War Office, Pall Mall, London, S.W., addressed to the Director-General of Contracts, on or before the 21st of February, 1862.

YORKSHIRE.—For building a storehouse at Scarborough for the United Corps of Militia Artillery, East and North Yorkshire. Plans, &c., at the Adjutant's Office, No. 19, Mulgrave-terrace, Scarborough; at the offices of Messrs. Leeman and Clark, in York; and at the office of Mr. Trevor, in Northallerton. Sealed tenders, addressed to "The Chairman of the Committee, and marked "Tender for Militia Storehouse, &c.," to the Adjutant's Office, in Scarborough, not later than Tuesday, February 18.

SUPPLY, &c.

SANDOWN.—For the supply of about 1,600 feet of 12-inch stoneware socket pipes, and about 1,100 feet of 9-inch ditto, with junctions and bends, for the Sandown Local Board of Health. The specification, with the conditions of contract, at the office of the Surveyor, Mr. F. Newman, 16, George-street, Hyde. Sealed tenders to be delivered to T. B. Hall, clerk to the Local Board, Sandown, Isle of Wight, by noon, on February 14th, and endorsed "Tender for Stoneware Pipes."

CONVICT PRISONS.—For the supply of timbers, deals, alates, lime, sand, bricks, lead, glass, wrought and cast iron, ironmongery, gas and water pipes, white lead, oils, &c., for 12 months from the 1st of April next, to the 31st of March, 1863, for the Pentonville, Millbank, Brixton, Portland, Portsmouth, Chatham, Parkhurst, Dartmoor, and Woking Prisons, and the Refuge at Fulham. Tenders, pre-paid, addressed "The Directors of Convict Prisons, 45, Parliament-street, Westminster, S.W., on or before noon of the 1st March. Forms of tenders at the several prisons before named, or at the office of the Directors, 45, Parliament-street, on and after the 15th February.

SOUTHAMPTON.—To supply and lay down certain new paving in various parts of the town of Southampton. Specifications with Mr. J. G. Poole, surveyor, Landsdowne House, Southampton. Sealed tenders, endorsed "Tender for Paving," to Charles E. Deacon, clerk, Public Health Office, Southampton, on or before 15th Feb.

THE ROAD ACROSS HYDE PARK.—Yesterday the St. Pancras vestry, on the motion of Mr. Lawford, unanimously resolved to oppose any attempt to make the new road across the park at the expense of the metropolis, and called upon the members of the Metropolitan Board to oppose it in that body. Mr. Farrer said the Exhibition Commissioners last time realised a profit of £150,000, and as this road was for their benefit, let them pay for it.

LIVERPOOL CEMETERY COMPETITION.—The Committee have decided upon awarding to Messrs. Lucy and Littler, architects, the first premium for designs for the chapels, &c., to be erected at the new cemetery, and the second to Mr. Reed, architect. Messrs. Lucy and Littler will be appointed to carry out the works.

THE WROXETER EXCAVATIONS.—The work of excavation on the site of the ancient city of Uriconium is progressing, and the men employed for this purpose are now investigating the mounds and trenches said to indicate the boundaries of the ancient city. It has long been a question among archaeologists whether there ever was a stone defence as well as earthworks around the city, and hitherto attempts to discover the walls have been unavailing. Guided, however, by a large figured stone which has been from time immemorial in a rill of water which bounds the glebe land, the men cut a trench directly across the field still called "Old Walls," and being a part of the rector's glebe, and here they found what is thought to be the old wall of the town of Uriconium. They have found a stone wall exactly where the old Ordnance map places the walls. From about 8 inches to 18 inches below the turf they have disclosed a bed of rough, unheven stone set in clay, and of no great thickness. It is exactly 6 feet wide, and has been uncovered for a distance of 34 yards, but it can be traced above 100 yards more in the adjoining fields. The stone wall is not on the top of the ridges, but on the outer slope of one ridge, giving a tract of high ground immediately within the wall. These interesting remains are believed to be only the foundations of the real wall, the superstructure having been carried away. It is proposed to try some other part of the boundary in the hope of discovering some of the upper part of the wall.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favor us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

STEPHEN W.—Paper sent shall be looked into.

SUBSCRIBER TO THE "BUILDING NEWS" (Cumberland).—Rowner and Co., Rathbone-place.

G. J. C. D.—A very objectionable arrangement.

R. E.—Shall appear if suitable; thanks.

V. R. S.—We cannot say.

M. G. W.—Not of sufficient interest to our readers.

A. READER (Gloucester).—Shall appear.

M. R. A.—Next week.

R.—We cannot assist.

JAMES W.—In course of preparation.

Z. Y. Z.—We have no doubt as to the legal aspect of the case, but cannot interfere.

A PUPIL.—Yes, deferred for want of space.

A BRUIEN (Yorkshire).—The facts are already in our possession.

B. R.—Received.

MESSRS. K. and G.—Shall be given next week.

MR. BLANK.—We cannot say.

GEORGE M.—N.—Below our mark.

Q.—Thanks.

LET SQUARE.—Apply by letter.

A HOUSEHOLD.—Spring-gardens, Charing-cross.

R. R.—Nothing of the kind.

X.—Review will be given.

NOTICE.

The Seventh Volume of the BUILDING NEWS is now ready, bound in cloth, price 21s. Subscribers can have their copies bound, either with or without the advertisement pages, for 4s. 6d., on sending them to the office. Cases ready for binding the volume may be had price 2s. each.

* * All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Bow-street, Strand, W.C., except letters referring to advertisements or other business matters which should be addressed to the Publisher, 18 to 21, Old Bow-street.

Advertisements are received up to six o'clock on Thursdays.

THE REMOVAL OF THE MUSEUM COLLECTIONS TO SOUTH KENSINGTON.

Tis hard, indeed, if the public cannot be made to believe that Brompton is the true centre of London, and the fittest site for every conceivable purpose under the sun. You must eat your whitebait at Greenwich, and your oysters on Lake Fusaro. So pictures and gardens, nature and art, are nowhere to be enjoyed in such perfection as beneath the shade of the "Boilers." Visitors are not yet deposited by a railway at the doors of the South Kensington Museum, but they will be. No one is thinking of carrying a railway into Great Russell-street, or to any other museum; so there can be no doubt, as the authorities at South Kensington assure the inhabitants of this metropolis,

that theirs is, or will be, the single establishment most readily accessible from east, west, north, and south.

It would be mere waste of time to say anything about the situation. Those in favor of it do not deny that South Kensington is an outlying district of London; but they maintain that, practically, locality is a matter of no importance, as when the working man goes out for a holiday, he takes with him his wife and children, and thinks nothing of distance. If anything, he rather prefers a walk of four miles or so, when, at the end of it, he has fresh air and a pleasant prospect. "The public leave the London streets," says Mr. Bowring, "and cross the London parks, and soon arrive at the site." Without discussing the exactness or otherwise of these statements, it may be not amiss to notice the carefully-compiled weekly return of visitors. Here is one announcement:—

SOUTH KENSINGTON MUSEUM.—During the week ending Jan. 25, 1862, the visitors have been as follows:—On Monday, Tuesday and Saturday, free days, open from 10 A.M. to 10 P.M., 6,901; on Wednesday, Thursday, and Friday, students' days (admission to the museum, 2d.), open from 10 A.M. till 4 P.M., 1,231; total, 8,132. From the opening of the

public, 6d.), open from 10 A.M. till 4 P.M., 2,454,626.

The object of this departmental arithmetic is clear. It is as if they should say, "Look here, see what an enormous number of persons visit our collections at Brompton, proving at once their popularity and convenience of access." At first sight such seems to be the fact; but when it is remembered that *no other free public exhibition is open in the evening*, any comparison between the numbers visiting South Kensington and those who go to the National Gallery and British Museum is ridiculously unfair. Let our readers imagine what would be the effect on the annual totals at the two last named institutions if they were to be opened *three days* in the week till ten p.m. We find it stated that the attendance at South Kensington is "nearly equally divided" between the day and the evening, so that from 35 to 40 per cent. must be deducted from the weekly total in order to place the question on its fair and proper footing. We pass over the consideration that refreshments are sold in the building, that the museum stands amid an idle population, and is much frequented by nurse-maids and children, although these must affect considerably the daily average. We have been led into making these remarks because, bound up with the report of the Committee on the British Museum, is a statement of the numbers annually visiting various public institutions, which are divided into "exhibitions in town and exhibitions out of town, to which the objection of non-accessibility would apply."

The Science and Art Department has won over to its views the Government which, on a recent occasion, put forth its whole strength of official Trustees in order to get a final decision on the removal of some of the contents of the British Museum. A rumour was industriously circulated that part of the Zoological Collection was to be conveyed to South Kensington during the recess. It proved, however, that the Trustees had advised the transfer of the Mineralogical and Geological Collections. This step can be carried out only with the sanction of Parliament. And we earnestly hope that, when the motion is brought forward, the independent members of the House of Commons will meet it with the most strenuous opposition.

The interest and delight taken by the general visitors of the Museum in the birds forbid the advocacy of their removal. The Trustees acted wisely in making their first attempt on the minerals and fossils. Here was the chink in which to introduce the thin edge of the wedge. Let them

succeed, and other collections will infallibly follow. The keepers of the departments assailed are opposed to any transfer, so that the resolution of the Trustees is marked by the distinguished qualities of being contrary to the plainly expressed opinion of those officers, in defiance of the remonstrance of the whole scientific world, in scorn of public convenience, and in the teeth of the Commons' Report.

The objects singled out for judicial separation cannot be packed and unpacked without injury to many, and some time must necessarily elapse during which they will be unavailable for purposes of study. "The mastodon," Mr. Waterhouse says, "is in a very bad condition." Its constant repair is rendered necessary by the mere walking of the people. He believes that it could not be moved, or, if moved, that it would have to be so made up as to become worthless. Beside the destruction of some, and injury to other specimens, there is a risk of the smaller ones being detached from the tablets to which they are affixed with gum, and of their identity being thus entirely destroyed. As many of these are type specimens, from which figures and descriptions have been taken and published, the loss to science would be considerable. Of the minerals in the possession of the Museum, a great number are not exhibited, but out of these a large proportion "would not be worth cataloguing." Shut up in drawers are inferior duplicates which, the keeper states, are positively rubbish, and, if shown, would not be worth the value of the ground on which they stood. We shall be curious to know if it is gravely proposed to transfer these valueless stones to the other end of London. As the Museum has power to sell, or to exchange, but not to give, it seems more than probable that we may yet have to witness the farce of carting this rubbish to a distance of three miles and a half, unless Parliament has strength to resist the Circæan blandishments of South Kensington.

This project of splitting up the national collection is viewed with the strongest dislike by every scientific man. It has been reported against by the Committee of the House of Commons, appointed to take evidence on the matter, as one that "would excite much dissatisfaction, not merely among a large portion of the inhabitants of the metropolis, but among the numerous inhabitants of the country, who from time to time visit London by railway." Not only so, but eminent foreigners have expressed their regret at hearing that any such idea was entertained. Sir R. Murchison expressly stated this fact before the Committee, and handed in a letter on the subject addressed to him by M. de Verneuil, member of the Imperial Institute of France. The writer says:—"The British Museum, as it now stands, is a monument unique in the world, which we envy you the possession of, and the preservation of which concerns your national glory. To bring together in a single assemblage the productions of nature and the *chefs-d'œuvre* of art is a grand and noble conception, which should not be abandoned. In our country nothing similar exists." M. de Verneuil strongly urges that every effort should be made to maintain the establishment in its integrity. "Endeavour," he says, "to have it extended where it originated, and where, up to this day, it has met with all those conditions which have insured its prosperity—remove houses and make room for it." This is, obviously, the better course to pursue, and the one recommended by the Committee after the fullest inquiry. Ground to the extent of 5½ acres can be obtained on three sides of the building; and, even if there were not this resource, much space might be gained by appropriating the houses now occupied by officials.

The dismemberment of the British Museum is disapproved of by every scientific naturalist, and by the keepers of all the departments. The single exception is Professor Owen, who, if the decision of the Trustees hold, will find himself like the "engineer hoist with his own petard." He says in his evidence that he objects to the transfer of the mineralogical collection; he thinks that the various classes of natural objects "should all go together, or stay together." Formerly Professor Owen thought as other leading men, and signed, in company with them, a memorial to the effect that any removal would be viewed by the mass of the inhabitants with extreme disfavour, and that persons from the eastern, northern and southern parts of London would feel it very inconvenient to resort to any distant locality. He has changed his opinion, but even now he owns that he would much prefer to have room for future extension found at Bloomsbury. He considers a space of at least five acres so essential to the right and healthy progress of a national collection of natural history as to outweigh the conveniences of any particular locality. The learned Professor adds "I love Bloomsbury much, but I love five acres more."

With the innate tendency which every one has to ride his own hobby, this eminent naturalist makes such extraordinary demands for space, and his ideas as to what a national collection should be are so vast, that the State would be heavily taxed in the attempt to carry them into execution. On all hands we hear complaints that the collections at the Museum are already so unwieldy and extensive as to bewilder and confuse, instead of instructing the visitor. But give Professor Owen the rein, and we honestly believe that an average parish would hardly hold the multitudinous objects. Birds, beasts, and fishes—all we must have; animals that live on the earth now, and every extinct species; species and varieties of species, represented by male, female, and young; one entire skeleton of the male and female of each genus, and, where there is any marked diversity of species, a skeleton of each.

Though we actually possess 12,000 specimens of fishes, we exhibit only 754. We are badly off for sharks—British sharks, 35 feet in length, which frequent our coasts. Such have been thrown up at Brighton, Worthing, and elsewhere. The only sharks we have are put between the wall-cases and the ceiling, where their distinctive characters cannot be seen or pointed out. We do not exhibit a single whale. As this animal is one with which English capital and English enterprise have largely dealt, the Professor

thinks that we ought to preserve at least one good specimen. If not, we shall be open to the reproach earned by the Dutch sailors, who, in their voyages to Batavia, were so intent on killing the dodo for food, that they ignored its value to science; the bird is now utterly extinct, and we show a solitary dried foot as one of our greatest curiosities. The public will be more easily reconciled to the absence of the whale when they hear that the dried skin is apt to become so offensive that few visitors would care to enter the room in which the animal is exhibited. The whale shown to country folk turns out to be an impudent imposture, and is really canvas stretched over a wooden framework, and cleverly painted.

Professor Owen would be satisfied with nothing short of a gallery that should contain every known species of mammalia. All must be obtained, and not only obtained, but exhibited. Enormous as is the space required—850 feet long by 50 wide—it would be insufficient, when we consider the great size of some of these mammals. Take the elephants, of three varieties, African, Indian, and Sumatran; to exhibit a full-grown male and female and the young animal would alone fill a fair-sized room. And, to turn to our whilom friends of Baker-street, where on earth should we put the cattle of various breeds, and other domestic animals, as horses and dogs? These last present considerable difference in the growing stage, as the greyhound; and, if we are to act on the rule laid down, we must show three specimens of each variety. The integument of many species of this class renders them difficult to stuff and set up; and thus some excuse may be found for the fact that our present mammalian saloon is a ludicrous caricature. The tumble-down attitudes and botchingly sewed skins of the animals make every one glad to pass through it as quickly as possible. The confined space and darkness are here of positive service in concealing these wretched creatures, which would ill bear the full light of day, or "proper exhibition."

The whole area devoted to natural history is at present 50,000 feet, and we are asked to provide 485,100. The Zoological collection is now contained in 37,500 feet, and Professor Owen estimates the required space (looking forward, of course, to future needs) at 240,000 feet! If the whole division of natural history were to be moved to some other locality, he would like to have 5 acres for a two storied building, and, for one of a single story, 10 acres!*. As these demands are hopelessly extravagant, and as the line must be drawn somewhere, what we have to consider is how, by a reasonable expenditure of public money, to make our collections most attractive to casual visitors, and most useful for purposes of study. Professional instincts would, perhaps, prompt us to lean towards the Department of Antiquities, in which the keeper wants 61,469 feet additional; and might, therefore, suggest a clearance in its favor of the Natural History Collections; but we prefer to view the subject at a broader range from the standpoint of the general public, and especially of the class dependent on wages, whose instruction is one (professedly) main object of the British Museum.

If it can be shown that the public, including in this term the crowd of mere holiday makers as well as the more intelligent, who really visit the Museum in order to obtain from its collections information as well as amusement, and that students, from the most cultivated and eminent persons down to the humble inquirer who has had his curiosity excited by some slight elementary work, will, each and all, be benefited by a rearrangement of the departments on another principle of exhibition; if the idle gaze of the ignorant and the thoughtful researches of the learned can be gratified in the self-same way, why should we hesitate to achieve so desirable a result? If, in addition, this end can be attained with a just regard for the national pocket, the adoption of any other system seems fatuous and absurd.†

FALL OF HOUSES AT HACKNEY.

ON Wednesday morning, about 10 o'clock, another accident of this kind happened in the Amherst-road, Hackney, near the railway station. On the south side of the road a range of houses, three stories in height, and having shop fronts, are in course of construction by Messrs. Amos, builders. The roofs had been covered in, the carpenters were engaged in laying the floors, and plasterers and laborers were occupied on the scaffolding, when a rattling noise was heard, and the next instant the front walls and the roofs and the whole of the floors of the second and third houses from the Hackney end of the road fell, dragging with them a portion of the end or corner building. The men at work, of course, fell, and were buried beneath the mass of ruins. After great exertion twelve persons were got out, two being quite dead. A similar accident is said to have occurred some months ago in the same locality.

We hope that a most searching inquiry will be instituted as to the cause of this accident, for it is quite time that some one should be held responsible, and that we should be able to go out without fear of being precipitated into an area, or of being crushed by falling houses.

FIRST CITY OF LONDON ENGINEERS.

AT a meeting of this corps, held at the City of London National Schools, White-street, Finsbury, it was resolved to form an artisan company, to be composed of the trades authorised for the Royal Engineers, viz., carpenters, joiners, cabinet-makers, masons, bricklayers, plasterers, smiths, engine-fitters, millwrights, coopers, painters, sailors, collar-makers, miners, draftsmen, &c. Members of the trades enumerated will not be required to pay an entrance fee, and will be provided with the uniform and accoutrements on terms to suit their convenience.

THE APPROACHES TO THE EXHIBITION BUILDING.

IMMEDIATELY after the beginning of the works at the International Exhibition building, we called attention to the inadequate nature of the approaches to it, and to the inevitable "block" which would take place in almost every one of the neighbouring thoroughfares when the tide of visitors flowed to South Kensington. It needed no great amount of foresight to arrive at this conclusion. The spectacle of entangled carriages and troubled Jehus seen in the Exhibition-road on an ordinary flower-show day at the Horticultural Gardens is a sufficient indication of what may be expected when the concourse of carriages is increased twentyfold, and when omnibuses, cabs, vans, together with stage-carts and every species of middle and lower class vehicle are likewise driven there to mingle in the confusion. We all recollect the congested state of the main London streets on the night of the Peace Celebration in 1855. If we will but fancy such another concrete mass of horseflesh, carriages, and humanity wedged into every road and lane around the Exhibition building, we shall have but a mild idea of the difficulties and disasters which will belt it like a Pasaal ring. Everybody seems to anticipate this "coming tribulation," but no one seems powerful enough to avert it. Mr. Cowper has been coquetting for the last three months with the parochial authorities of Paddington and Kensington, with a view of inducing them, jointly or separately, to make a road across the Park; and they, in their turn, have hoped to induce him to do it. Both parties desired the benefit of the road, but neither wished to pay for it; so the curtain fell upon the comical farce at that point when they mutually became acquainted with the object of each other's tender protestations. They then joined in an attack upon the unfortunate Board of Works, and thus diverted the growing discontent from themselves to that body. One would have thought the Board of Works was already sufficiently weighted; what with sewers, embankments, and speechifying members, it is not likely to make much progress in the matter. We may guess very well what their proceedings will be—to talk about it for weeks, to refer it to a committee, to listen to the representatives of the interested parishes, who will, of course, advocate it, to hear the opposition of other members, who desire an outlay to be made—where it is, of course, much more needed—in their own districts. Thus the subject will be laid out for death and burial, unless it be snatched from their stifling atmosphere.

The Exhibition Commissioners have received numerous suggestions upon the matter, but they have waited patiently, like the prey of the box-constrictor, to be compressed in its grasp or to be relieved by some one "in authority." The doughty champion has at length appeared in the person of Sir R. Mayne, but, with all the knowledge, he has not the weapons with which to subdue the growing monster. The Commissioners admit the value of his suggestions, and "entirely concur" in the opinion that the removal of the obstructions are essential to the safety and comfort of the visitors, but they add that "Sir Richard Mayne has only embodied the substance of what they already knew." If so, why did not they take steps to remedy it? They erected their building amidst a web of narrow, crooked lanes, and are as much to blame as a man who should build a house without a staircase. It is all very well to throw the responsibility from their shoulders, and to talk about the "discredit which will naturally attach to the metropolis if the approaches to the Exhibition are found in their present state on the 1st of May."

The Commissioners may be assured that the first blast of the anticipated discredit will very justly be towards them. All that the metropolis should be concerned about is to make sufficient thoroughfares for ordinary metropolitan traffic; it is no part of its duty to provide for the approaches to a temporary building, at a cost which would cover works which are urgently and permanently required, and simply because the promoters have planted their building in a spot unapproachable by existing roads. It is, beyond all question, the Exhibition building which necessitates the new cuttings, the expense of them ought consequently to have been calculated for and provided from its funds, the more especially as it is but a temporary structure.

The Commissioners will take all the money received at the doors, and the public will pay for its enjoyment. Had the Commissioners six months ago expressed the convictions which they now give utterance to, of the absolute necessity of improved approaches, and had they been firmly told that they must look upon such necessity as one which exclusively appertained to them, there is no doubt that they would have found the money, and have discovered it to be to their interest to afford safe passage to and from the building. They, however, found it convenient and economical to shut their eyes to this acknowledged apprehension, and now strive to shift the discredit to the "metropolis."

We are now within three months of the opening of the Exhibition, and no step has been taken which brings us a yard nearer to the end of the difficulty. Mr. Cowper, who found money for making a road in the Park, has no money for cutting one across it; the Commissioners earnestly trust that the "Government, the Metropolitan Board of Works, the various parochial boards and other bodies"—every one, in fact, except themselves—will not hesitate to take decided steps, i.e., to find the money. All these several Boards, on the contrary, earnestly wish that the Commissioners would make the honorable sacrifice. No one, seemingly, will do the work, and no one apparently can be made to do it. One little attempt at compromise, or at joint action, is amusing. Mr. Cowper offers, on condition of the Board of Works finding the necessary money, to procure a Bill from Parliament which will secure the road to the public.

Sir R. Mayne now comes forward, and in a very able letter to the Exhibition Commissioners, sums up the obstacles which must be removed, and the new approaches which must be made, before he can undertake to keep

* (Question 727, 728) 11 acres 21 poles, with libraries, offices, residences, and everything to make the whole complete.

† This estimate provides for all the present collections and also for moderate accessions.

‡ To be continued.

order in the streets. He insists on the absolute necessity—"1st, of the formation of a new road across Kensington-gardens; 2nd, opening Park-lane into Hamilton-place and Piccadilly; 3rd, of widening the Brompton-road; 4th, widening the short street from Ebury-bridge into Sloane-square; 5th, of making a tramway or a common road connecting the railway station near Kensington with the Cromwell and Gloucester roads; and, 6th, the removal of the barriers in Exhibition and Cromwell roads." The "observations" tacked to the Commissioner of Police's letter show very clearly that the police will have quite enough to do even if all his suggestions are carried out; but we are afraid, from the courteous reply in which Sir Richard is referred to all bodies "with whom the power may rest," that the Exhibition Commissioners will do nothing to facilitate the labor of the police, or to further the comfort of their visitors.

The Government does not appear to have power to make anybody do the work or rather pay for doing it. It had better therefore meet the difficulty at once and vanquish it. The approaches must be made, in spite of the affected indifference of the parties interested. Let Mr. Cowper but confess his inability to compel others, and Parliament will, we hope, grant him sufficient funds to dispense with even the advice of the irresponsible bodies. We should contentedly leave him to adopt the suggestions of Sir R. Mayne, and to carry them out with the same energy and determination which he evinced in forming the famous "ride." The inhabitants of Bayswater will even forgive him that "intrusion upon the privacy of the gardens," if he will but intrude upon it still further, and give them, gratuitously, a road across them.

If the Government fences with the matter as the other bodies have done, we must take the fruit of the Exhibition with its encompassed ring of discomfort. The public must calculate on inconvenience and disaster when it visits South Kensington, even as it bargains for thorns in plucking gooseberries, but it will be no more reconciled to the folly and inactivity of the Commissioners and "other bodies" when smarting from the consequences of it, than it is now when only anticipating it.

THE ART-UNION.

WE have received the engraving of the London Art-Union for the forthcoming distribution. It is a large and costly work, engraved by Mr. Sharp, from F. Goodall's picture "Raising the Maypole." Of the composition of the picture we cannot speak very highly; something to unite the two groups into which it is divided seems wanting, and this is not supplied by the maypole, which, occupying the centre, is not very happily posed. Either of the principal groups is satisfactory in itself, but attention is not sufficiently directed to the event—raising the maypole. It is a fine engraving, however, and could not, under ordinary circumstances, be obtained for double the amount of the subscription.

It appears that the Society has collected and expended over £280,000 in the advancement of the objects for which it was established.

THE PROPOSED NEW ROAD ACROSS HYDE-PARK.

AT the usual weekly meeting of the Metropolitan Board of Works, held on Friday, at the offices, Spring-gardens, Mr. JOHN THWAITES, the Chairman, presiding; Mr. POLLARD, Clerk of the Board, read a letter which had been received from the Right Hon. W. Cowper, First Commissioner of Public Works, in which he suggested that the proposed new road across Hyde-park (to give increased facilities of access to the ensuing Great Exhibition) should be carried out at the expense of the Metropolitan Board. He also stated in the letter that the estimated cost of the proposed road was from £30,000 to £40,000, and that if the Board would undertake the formation of the road at their own expense, he would undertake to obtain an Act for the purpose of securing to the public a permanent and unrestricted use of the road. Some members of the Board expressed an opinion that the road would in all probability cost at least £60,000.

Mr. ECKETT moved, in accordance with notice,

That considering there are many public improvements required in the metropolis which are of greater importance than that of making a new road across the property of the Crown, in Hyde-park, and which the Board at present cannot effect, from not having suitable means for that purpose, this Board therefore does not deem it expedient that it should undertake the making of the proposed new road across Hyde-park.

Mr. BROOKER seconded the motion.

Mr. ROCHE moved, as an amendment,

That the letter of Mr. Cowper, of January 30th, 1862, be referred to the Streets Committee for consideration and report.

Mr. LE BRETON seconded the amendment. After a long discussion the amendment was carried by a majority of 22 to 17, and thus became a substantive motion.

Mr. LEGG then moved as an amendment upon it,

That Mr. Cowper be informed this Board decline to take upon themselves the formation of the proposed road, unless Government place at their disposal funds for such purpose; the Board having already deferred the consideration of many great improvements in the metropolis, in consequence of not having funds to carry them out, but are prepared to take measures forthwith for the formation of the proposed road through Hyde-park, in accordance with the suggestion contained in the letter from the Right Hon. W. Cowper, dated 30th January last, provided he will obtain the sanction of Parliament for transferring to this Board, for the purpose of effecting public improvements within the metropolis, the income arising from Hackney cabs and omnibuses, collected within the metropolitan area.

Mr. ECKETT seconded the amendment, which was lost.

The motion of Mr. ROCHE was then agreed to.

Mr. ROCHE moved—

That Mr. Cowper be informed that the matter had been referred to a committee for consideration, and that he be requested to forward to the Board, as early as possible, the plans and estimates, which were understood to be then in course of preparation.

This motion was seconded and agreed to.

Mr. FRANCIS BEDFORD has been appointed to accompany his Royal Highness the Prince of Wales in his tour through the East, for the purpose of taking photographic views of the landscapes, figures, and architecture of the various remarkable places that may be visited.

AN ARCHITECT OUT OF PLACE.

IT is very seldom, we are glad to say, that an architect figures prominently in any of our criminal courts. The gentleman who played so conspicuous a part in a recent trial before the Common Serjeant deserves, consequently, a passing notice at our hands. It is true he appeared as prosecutor in the case, but the unanimous opinion of all who heard his cross-examination, or who read even the abridged report of it in the newspapers, undoubtedly was that he occupied a wrong position, and a position which it may be said very positively architects do not usually occupy. An "architect" (we have called him an architect, because he so styled himself), one Mr. Brown, indicted a carpenter in his employment, who had formerly been his petitioning creditor, for stealing a quantity of yellow battens. The evidence adduced was curious, for we all know that it is very unusual, and, in fact, contrary to all respectable practice, for an architect to furnish the materials of a building, and to claim the ownership of any such which may be missing from the works, or which had not, "to his knowledge," been delivered. Even the "continual laugh" and "great flippancy" with which the prosecutor answered the prisoner's counsel, did not gild the features elicited in cross-examination. They told us very plainly what an architect should not be. He had been engaged in a great many building speculations.

Further light was thrown on Mr. Thomas Thury Johnson Brown's professional practices by the questions of the opposing counsel. By his orders some of the men had broken open the prisoner's desk. He had reinstated men who had been discharged by the superintendent of the works. He had brought actions against Mr. Bosanquet (the Treasurer of the Association for the Improvements of the Dwellings of the Poor, for whom the building was being erected), for conspiring with others to charge him, the "architect," with forgery.

We have strung these pearls together neither for their beauty nor their rarity, but because they possess a certain negative value in showing what an architect is not. Mr. Brown, spite of his conveniently defective memory, has revealed himself in very positive colors. The whole profession does not, we believe, contain another such original. None but himself can be his parallel. A leopard might pass for a lamb, and a negress for the "lily maid of Astolat," but that Mr. Brown could ever be employed by educated gentlemen as an architect, and as observant of the usages of a liberal profession, excites our surprise. Nearly everything, in fact, which he professes to have done to the building, whence this trial sprang, is foreign to the practice of architects. They neither pay the men nor buy the materials. They neither engage nor discharge the workmen, nor do they receive their visits on a Sunday. An architect could not by any possibility, without losing the respect of his class through over-stepping the limits of his vocation, be the prosecutor in such a case as that upon which we now comment. The ordinary training of the profession at least preserves its members from such pitfalls, and it is well to remember this when a gentleman of some distinction has asked before a "Society of Arts" what an architect is. He pointed out what can be accomplished without regular education, and without "professional trammels." We will make him a present of this case to back his future arguments. He has a specimen at South Kensington of the art which can be got without them; he may now have a sample from the Central Criminal Court of the morality found outside them. Scylla and Charybdis naturally are reflected in the same strait. If an employer avoid the one, he is likely to be imperilled with the other. If he wants his work well done, artistically and morally, he had better sail in other waters, and steer his ship where men of cultivated taste, of common sense, and ordinary prudence are content to go.

If an architect of less extensive general experience than Mr. Brown, but with a conscientious regard for the duties and the honor of his calling, had been consulted and engaged, the Association for the Improvement of the Dwellings of the Poor would not have had their building now at a standstill; a respectable builder would have had the contract, and the work would have been satisfactorily done. We now find no mention of a builder in the case. He, seemingly, for some unexplained reason, was deemed useless, and the so-called architect and the workmen ran confusedly together. We more than half suspect that some foolish miscalculations have laid at the root of the business. An "architect and speculating builder" may have been just the man to know how to do the thing cheaply. The knowledge of many things economically concentrated in one vessel was spoilt, however, by the pot which contained it, and the old proverb of "cheap and nasty" found another apt illustration. We are sorry for the Society, which must suffer by this transaction; but societies, however philanthropic, are no more exempted than men from the consequences of folly. If they sow thistles they must expect to reap them. This Association began its building on a novel principle, and it has an exceptional result. We have some pity for the employers in this case, because we believe they meant well towards the poor for whom they had to provide; but we shall have none for any one who, with this example before their eyes, goes and does likewise.

Mr. T. Thury Johnson may relapse into either of the many vocations of his chequered and eventful career, but the account of his own life which oozed through his guarded and smiling lips in the witness-box of the Central Criminal Court, will not be without service if it establishes in the minds of all men entering the profession the conviction that such attainments as he acknowledged, grafted even upon an architectural education, bears but Dead Sea apples, and that it is only by honorable conduct, upright actions, and level steps, that we can do our duty to ourselves, our employers, and our profession.

BARRACK BUILDING.

Maidstone.—We hear that the difficulties in connexion with the enlargement of the Maidstone cavalry depot have now been entirely removed, and it is understood that the estimates will be brought before the Government forthwith. It is proposed to extend the barracks as far as Wharf-lane, necessitating the removal of the whole of the houses on the side nearest the garrison; a road, however, being still reserved down to the river. The Grasshopper Inn, and the adjoining houses facing the Sandling-road, as far as the above lane, will also be taken down; and as the front boundary will be in a line with the present railings, an ugly angle, as well as some very unsightly buildings, will be removed, and the road at this spot very considerably widened and improved. The plans for the new barracks propose to furnish accommodation for about 800 men and 500 horses. The quarters for the commandant, staff, and other officers, with the mess-room, &c., will be erected on the site of the present wooden buildings, with a considerable extension on the south side, the whole forming a range of buildings 600 feet in length. At right angles with this range, on either side, running down towards the exercising field, the soldiers' quarters will be erected, forming two very large blocks of buildings, each three stories high. Separate provision is to be made for the married soldiers. The stables will be erected in the rear of the soldiers' quarters, and a second riding-school will be built, exactly similar to that now nearly completed, which is covered with a light iron roof, 50 feet in the clear. The hospital will be enlarged to double its present size, and nearly an acre of ground will be thrown into the exercising field. It is proposed that the main entrance should remain at the same spot as heretofore, but a second entrance will be formed, leading from Wharf-lane. The new barracks will be erected of brick, with cut stone dressings. The expense of carrying out the whole of the work is estimated at about £30,000.

Colchester.—Government has accepted the tender of Messrs. Lucas Brothers for the erection of the new Cavalry Barracks in extension of Colchester Camp. The original estimate was £52,000, and the amount of the contract is understood to be £49,700. Eight firms tendered for the works, which are to be completed within 12 months, although it was at one time contemplated to extend them over 21 months. The foundations are to be completed before the close of the month of March, and an extensive system of main and lateral drainage will be carried out. The barracks, which are for a regiment of cavalry on the home strength, are, as lately stated in our pages, to be formed in blocks, affording accommodation for about 72 men each, and will be built of red brick, two stories high, except the officers' quarters, which are to be of three stories. The site of the erections will be the extensive grounds of the Abbey Farm, purchased about two years since by Government. Although these works will exhaust the Parliamentary grant made during the last Session, it is understood that further sums will be asked for in order to carry out the entire plan, which embraces accommodation for two or three batteries of artillery and a strong body of Royal Engineers. This scheme will bring together the various branches of the service, and make Colchester the principal military station of the eastern district of England.

Gravesend.—The barrack buildings now in course of erection at Gravesend for the accommodation of the officers and men sent to that station from the garrison at Chatham, will be completed and ready for occupation during the approaching summer. The additional buildings include a building behind the present block, running to nearly 200 feet long, 24 feet wide and 12 feet high. Adjoining this building is placed another block of houses for the officers' servants, accommodation being provided for 32 men. In addition to the several blocks of buildings already completed, a guardhouse is now in hand, together with quarters for the staff, mess-rooms for the officers and non-commissioned officers, and the usual offices. There are also buildings to be used as cook-house, commissariat store-rooms, reading-rooms, lavatories, and hospital. The buildings are erected of light colored brick, with quoins in red brick. The plan of ventilation adopted was suggested by the Army Sanitary Commissioners. The rifle range at which the troops will be instructed is situated some distance from the barracks, in a secluded part of the outskirts of the town.

PROGRESS OF THE METROPOLITAN MAIN DRAINAGE WORKS.

At the last meeting of the Metropolitan Board of Works, Mr. BAZALGETTE, the Engineer-in-Chief, in his monthly report on the progress of the Main Drainage Works, stated that in the Northern Outfall sewer contract Mr. Furness had made good progress during the past month. The ironwork for the river Lee aqueduct was upon the ground, and the girders were fixed. The subways for the East London Waterworks, and the suspension of the supply mains, had been nearly completed, without accident, and the cutting through the embankment of the Eastern Counties Railway, 24 feet deep, had been made without interruption to the traffic. The foundation works for the New Stratford-road, and the concrete foundation along the line of sewer towards East Ham, were considerably advanced. As to the three lines of intercepting sewers in course of formation between the Bow and Barking railway and East Ham, sixty of the arches, each of 18 feet span, which will carry the intercepting sewers across the marsh lands, were completed. The materials supplied were abundant and of good quality. The value of the work done was about £185,000. In the Middle-level sewer, Messrs. Brassey and Co. had constructed about 21,400 feet of sewer, varying in size from 3 feet in diameter to 9 feet 6 inches by 12 feet, at an expenditure of about £96,400. These works were for a time retarded by an accident to a cofferdam, whilst constructing the sewer underneath the Regent's canal, by which the water escaped into the sewer and emptied the basin of the canal, but it was again opened in two days, and no further mischief was done. Precautions had since been taken to prevent the possibility of a recurrence of such an accident in this difficult portion of the work. The completing works of the Ranelagh Storm Overflow were in a very confined space in the Uxbridge-road, and progressed slowly. The value of the work done was £26,900. The Southern High-level sewer progressed very slowly, and the works were subject to frequent stoppages, owing mainly to misunderstandings between the contractors and their work people. About 7½ miles of sewer were now contracted, valued at about £144,000. Mr. Webster continued to progress satisfactorily with the Southern Outfall sewer contract, which will, to all appearance, be completed early in the spring, and before the time named in the contract. He had then constructed about 6½ miles of sewer, at an expenditure of about £263,000. At the Deptford Pumping station Messrs. Aird and Son had brought up the foundations of both engine-houses to

the ground level. They had constructed 484 feet of the double line of Low-level sewer near to and below Deptford Creek, and had laid 3,648 feet of cast-iron pipe, 3 feet 6 inches in diameter, from the High-level sewer under Deptford Creek to the Pumping station, and driven piles for about 150 feet to the wharfing. The value of the work executed by them was about £57,000. Mr. Pearson had commenced his contract at Dulwich; and Mr. Dowds had constructed 332 feet of the Southwark subway, 335 feet of sewer, and 70 vaults, at a cost of £3,600.

DOORWAY AT KHOSH DINISSAR, MESOPOTAMIA.

WE this week engrave a view of the doorway of a mosque at Khosh-Dinissar, in the Mesopotamian Desert. The village in which it is situated is composed of a few mud huts, inhabited by cultivating Kurds, and lies some six or seven days' journey east of Aleppo, and a few miles south-west of Nisibin—the ancient Nisibis. The only object of architectural interest in the place is the mosque, which is very fine in its detail. It was built by Melek Mensur ibn Mahummad Thahar. Like everything else in Turkey, it has fallen into ruins, although it is still used as the village mosque, and guarded, consequently, with jealous eyes from profane intrusion. To the fortunate circumstance of our artist travelling in the company of a tribe of the Shammar, who divide the honor with the Anneyzee of being most dreaded for their foraging exploits, he was enabled to enter the sacred precincts and sketch at his leisure.

The building is a parallelogram, with a dome in the centre, occupying the whole width of the mosque. The doorway, which we have engraved, is in the middle of one of the longest sides. On either side of it are four niches, with pointed arches. They, like the doorway, have blocks of black basalt introduced in bands, resembling in that particular the early architecture of North Italy. A mutilated Arabic inscription formerly filled the tympanum of the arch. On entering, we find ourselves immediately under the dome, which has fallen in, but the corbelled springings of it remain. They are all different, and of beautiful design. Right and left of us, as we enter, run four bays of nave and aisles, separated by colonnades. Immediately in front of the entrance, the Kebab, which marks—or is supposed to mark—the direction of Mecca, is situated, and before it the faithful, at the stated hours, perform their genuflections and say their prayers. The Kebab is one mass of carved and interlaced work, designed with great taste and rich inventive power, and wrought with remarkable delicacy and finish. A modern wooden pulpit is fixed beside it. The whole building has a mournful look—dirty and dilapidated; but enough remains to show the style of art which once flourished, where now the plundering but artless Bedouen have undisputed sway.

THE HOSPITALS OF PARIS AND LONDON.

THE debate at the Imperial Academy of Medicine, on the relative advantages of the London hospitals compared with that of Paris,* still continues, its latest incident being a letter from M. Husson, director of the Assistance Public, of Paris, who expresses himself as follows:—

A large portion of the hospital of Glasgow has just been rebuilt on an improved plan, and in London the hospital of King's College has received an addition of two or three new wards, which, in truth, are rather large, but are by no means favorably arranged. Now, it is these improvements on which the whole debate is made to rest. The hospitals of London only contain 3,700 beds for a population which is double that of Paris. The hospitals of the latter city contain 7,000 beds, without counting the beds of the sick wards in the hospices; we have, therefore, to provide for greater wants under more difficult circumstances. Most of our hospitals are situated on high grounds or in the midst of plantations free from houses, as is the case with Beaumont, Lariboisière, St. Antoine, La Pitié, Cochin, the Enfants-Malades, and Necker. Nothing of the kind exists in London. With the exception of a single hospital situated near Hyde-park, all the hospitals of the city are built in the midst of populous districts, and in narrow streets. They have generally neither gardens nor courts, and the sick wards receive light from one side only, which is a great defect. There are even dissecting-rooms in several of the hospitals. Now these are the establishments which are compared to ours! It is true that the wards of these imperfect hospitals in general contain fewer patients than ours. The English like to leave large open spaces in their wards; but, by an illogical arrangement, they pack the beds closer together. There is no bad smell in the hospitals of London, although there is no artificial ventilation; and this advantage, with few exceptions, we certainly do not enjoy at Paris. But in London they open the windows during the doctor's visit, and several times a day, which explains the absence of smells. The English beds are much more simply constructed than ours, which are too complicated. There are no curtains to the English beds. The wards are warmed by fire-places, but it is a mistake to believe them sufficient to ventilate the wards, or to suppose that they can replace a well-arranged artificial ventilation.

DRESSING SLATES.—It is said that Mr. J. W. Greaves, of Port Madox, has patented an improved apparatus for dressing slates, whereby accommodation is afforded for two workmen at the same machine. The knives, or cutters, are mounted at a slight angle to the axial centre line of the machine upon a pair of holding discs. The cutting edges of the knives are in opposite directions, so that by imparting a circular reciprocating motion to the discs, the knives will alternately act upon and dress the edges of the slates, which are presented to them upon stationary cutters or knives at each side of the machine. The reciprocating motion of the discs and their knives may be derived from a revolving crank driven by a pulley and band, and acting upon a lever arm fastened on the main shaft, or by any other convenient mechanical arrangement. The different sizes of the slate are gauged by suitable gauges on each side of the machine.

PARIS.—The repairing of churches in Paris is being continued with great activity. The statues sculptured for the three niches in the church of St. Louis and St. Paul, in the Rue St. Antoine, at the junction with the Rue de Rivoli, have been put up. The statue of St. Louis, by M. Lequesne, is placed in the upper niche. A St. Anne, by M. Etex, is placed on the right, and a St. Catherine, by Auguste Préault, on the left. The church of St. Louis and St. Paul, of which the foundation was laid in 1627, was not completed until 1641.

* See page 33 ante.

SOCIETY OF FEMALE ARTISTS.*

THE landscape painters of this society now claim our attention. "Roslyn Chapel," by Miss Louise Rayner, is the most commanding, masculine and elaborate picture of the kind in the present exhibition. The colors are impasted with a boldness and character unusual from a female hand, but this lady possesses an energy in the execution of her subjects which shows her to be a thoroughly accomplished artist. In this picturesque interior, so often painted, but seldom excelled, there is a management highly creditable to her knowledge. The figure of the female drawing is admirably placed; and there is an excellent quality of color in the gradations and variety of tints with which the pavement is represented. The water-color drawings, by the same lady, of "West Bow Church, Edinburgh," and the "Head of the West Bow Church," in the same city, are really powerful, vigorous, and fine. Mrs. T. J. Thompson exhibits two landscapes, in both of which there is an elaborate attempt at rendering the luminous effect of daylight; but over anxiety to succeed has defeated the intention, for more middle tint of a cool color and less density in the shades, allowing room for more reflected light from the ground, would have brought her nearer to success. Mrs. Hemming treats her little subject with much taste and delicacy. "Grande Malines," and "Our Boarding House at Boulogne," are pleasing examples of her style. Mrs. Hussey, on the contrary, takes a dark view of nature, and although we have no objection to a peculiarity of tone when it tends to a poetic result, we do not discover in "Cottages at Studham, Dorset" that anything is gained to warrant the sacrifice of ordinary daylight.

"Rydal Water, Westmoreland," "On the Stock Gill River," "Bolton-le-Sands, Lancashire," and a "View in Wales," are very pleasing contributions by Mrs. W. Oliver. There is some clever execution in Miss G. Swift's "Shrimpers waiting for the Tide," and we observed a good family likeness in Miss C. F. Williams's "Morning on the Thames" to the numerous productions on canvas which catalogues class under the same name. "The Bass Rock, Frith of Forth—Approaching Storm," by Mrs. Dundas Murray, is treated with considerable skill and effect; we prefer it to her other picture, entitled "Grève de Leq, Jersey," because the sides of the view are better balanced by objects of interest. We know that the practice of many great masters is against our objection, but we always feel that when there is shore on one side of the scene and nothing but sea on the other, it looks more like half a picture than a whole one, unless great ability is exercised either in focussing the light or by the introduction of something which shall, apparently or really, produce the effect of a counterpoise. "Rock in Jersey," by Mrs. J. W. Bower, shows some courage, as it is treated in a decidedly Turner-esque feeling, and with good result. We should be happy to see her example more influential among our landscape painters, whether male or female. "Ante-Collegio in the Ducal Palace, Venice," by Madame de Feyl, is a highly-finished and an interesting production. "The View from Worcester Bridge" is an important drawing by Miss S. Wilkes. It has all the excellent qualities required in such a work. The water is flat, the distance retires well, there is great breadth of general treatment, and the whole thrown into air by the sharp and decisive manner in which the boats are touched. We admire the general treatment of "Ruins of St. Peter's, Chelmsford," by Miss Severn. "The Border Peel Tower—Moonlight," is highly creditable to the taste and execution of Miss Lucy Archer. Miss Isabella J. E. Jones is happy in her manner of coloring the old buildings in the "View of Monk's House, Gloucester," and "On the South Coast, near Hastings," by Mrs. Willis, is very freely pencilled and breezy in effect.

Of fruit and flower pieces, including "Still Life," there is not that numerous supply which might be expected in an exhibition of female artists. Miss Florence Peel is the leader in this branch of art; her "Azaleas" are painted with considerable feeling and power, but we confess our inability to discover her intention in the picture entitled "A Study of Color." It certainly is not a study suggested by the spectrum, and the result is, whatever the intention may have been, to show that a band of deep, rich, and powerful red around a mass of white and delicately tinted flowers will rebel against what may be considered the regular arrangement, overpower the centre group, turn the convex into the concave, and harmonise with no other part of the composition; against such odds it is useless to attempt a focus of light, and we noticed a piece of bank very unpleasant to the eye. "Goldfinches and Flowers," by Miss Emma Walker, shows great ability in closely copying the objects represented. The goldfinches are admirably painted, but they both possess so equal a prominence and individual distinctness that they might change places without the slightest change in the colors or in the effect; they therefore group badly, or, rather, not at all, and a great deal of really good execution is not only wasted, but actually employed to the detriment of the subject. A knowledge of *chiaroscuro* enables this lady to save her labor, and to produce a picture in the proper sense of the term, instead of a number of isolated studies on one sheet of paper.

Similar objections may be raised against an elaborate drawing, by Mrs. Withers, of "A Study of Garden Rock-work, with Robin and Nest." There is in this a great deal of labor bestowed on unworthy objects, to the injury of the whole. For instance, there is an unpleasant restlessness created by the endless repetitions of the peculiar forms of the leaves; and in copying a fragment of a flint the artist has lost sight of the substance in her effort to render the color. Now, this is a subject which, with more painter-like feeling in the treatment, might have been suggestive of a pleasing sentiment. A female bird sitting on her nest always excites an interest, and if the sparkling anxiety of her eye directed to the spectator had been made

the bright point in her little shady retreat, and the male bird, instead of standing out in unmeaning obtrusiveness, had been thrown into tone and mass with the surrounding accessories, a truly poetical result might have been obtained. From the hard and unflinching style of drawing and coloring in some strawberries on a cabbage leaf, this lady has evidently never heard of Titian's Bunch of Grapes. We must not forget to mention the ducks and geese, although certainly out of place, among "Still Life," by Madame Juliette Peyrol (*née Bonheur*), for the admirable style in which they are painted. There are a few miniatures on the screens, displaying a nice talent for that minute branch of art. Sculpture, by Mrs. Thornycroft, a whole-length model of the Princess Beatrice, from the Royal Academy, by no means so elegant as to warrant a second exhibition, and by Naomi Burrell, is distributed about the room, and a few animals in bronze after Rosa Bonheur.

INSTITUTION OF ENGINEERS IN SCOTLAND.

AT the conclusion of the paper on Wood-Planing Machinery (given in our last Number), the following discussion took place:—

Mr. J. BROWNLEE said that the earliest successful application of revolving cutters for dressing wood was by Mr. Bramah, who in 1802 patented a machine which is to some extent still used. In that machine the timber was passed beneath a horizontal wheel or face plate carrying gouges or knives, and running upon a vertical spindle with considerable velocity. It was not, however, until about the year 1827 that a machine was brought into practical use for the working of flooring boards, which was patented by Mr. Malcolm Muir, of this city; and, as Mr. Norton had said, the boards in Muir's machine were drawn over fixed plane-irons by an endless chain, the tongue and groove being at the same time formed by small circular saws running upon five different spindles; but, with the exception of a narrow strip along the edges, this machine did not operate upon the back of the board, nor otherwise reduce it to an equal thickness. In the year following (1828) another machine, of an entirely different character, was patented by Mr. Woodworth in the United States of America, where it was now extensively used, and so generally preferred as almost to have superseded all other methods, especially since the expiry of the patent, which, by two renewals, continued in force for a period of twenty-eight years, and, therefore, only expired in 1856. In the Woodworth machine the boards were fed by rollers. No stationary plane-irons being used, the boards were dressed smooth at the upper side and at the same time reduced to an equal thickness by knives fastened to arms (as represented by Mr. Norman), or to a block mounted upon a horizontal spindle which rotated with great rapidity. The tongue and groove were similarly formed by rotating cutters mounted upon two vertical spindles, one cutter head operating upon each edge of the board. The whole operation of facing, thicknessing, and tonguing and grooving, was thus performed by rotating cutters mounted upon three different spindles. About the year 1831 the rotating thicknesser of Woodworth—that is, the dibber or souter as described by Mr. Norman—was re-invented or imported and patented by Mr. Muir, up to which time the work produced by Muir's machine was very incomplete. Some time previous to the expiry of Mr. Muir's second patent, a machine was constructed and put in operation in this city by Mr. John Robb, in which he applied the feeding rollers and tonguing and grooving cutters of Woodworth; and being under the necessity of ending Mr. Muir's patent, he substituted for the rotatory dibber of Woodworth the revolving wheel of Bramah. Other machines, in which similar means were adopted, were about the same period made by Messrs. Norman and Clinksill, and by Mr. Thompson of Edinburgh. On the expiry of Mr. Muir's patent, the feed rollers, tonguing and grooving cutter, and dibber of Woodworth came into general use. The chief makers of those machines were Messrs. Norman and Clinksill, and the late Mr. McDowall of Johnstone, by whom many excellent machines were made and great improvements were effected. The modern machine, although scarcely presenting in its external appearance any resemblance to those originally invented by either Muir or Woodworth, was essentially a combination of both. For finishing the face of the board, the stationary planes, as introduced by Muir, were still retained, while the tonguing and grooving cutters—the thicknesser or dibber, and the feed rollers—operated precisely in the same manner as patented by Woodworth in 1828. The machine had undergone many modifications in the hands of different makers, but these modifications referred only to matters of detail and arrangement, the operating principle being the same in all. In the earlier machines proper attention was not bestowed upon the perfectly balancing of the different rotating parts of the machine, which was of first importance, and required not only great care on the part of the maker of the machine, but also upon that of the operator, who required to notice that the knives which he fastened upon opposite sides of the rotating block were always perfectly equal in weight. Negligence in this respect rendered it impossible to make good work with any machine. The necessity of this observance was, however, now generally understood. It was not, however, so well known that it was almost equally necessary that the belts by which the rotating cutters were driven should be as nearly as possible of equal weight throughout, without any clumsy or heavy joinings. Belts running at a moderate speed were sometimes joined by copper rivets, but this method of joining belts which run at high velocities was quite unsuitable, as the weight of the rivets not only communicated a vibratory motion to the machine, but also very soon destroyed the belt itself. After properly balancing the various rotating parts of the machine, the chief improvements which had been effected referred to the method of forming and fastening the cutters so as to facilitate the changes which were required for the various kinds of work, also to the means of adapting the machine to the various thicknesses of material, and in the methods of arranging the gearing, by which the feed rollers were driven, so as to accommodate itself to the different positions of the upper rollers, which rested upon the work, and rose and fell as the thickness varied. In the machine before them the rollers were driven, as would be observed from the drawing, by bevil wheels, the wheels which geared into those which were fixed upon the upper rollers slid upon the upright shafts, being supported by the ends of the shafts of those rollers, which ends projected into a groove cut out round the boss of the wheels sliding upon the upright shafts; and these wheels were thus held always in the same position with respect to the upper rollers, along with which they rose and fell. Although many machines had been constructed in this manner, he did not think the method commendable. The wheels which drove the rollers were by this arrangement limited to the same diameter as the rollers, which not only rendered the teeth liable to fracture from the strain they had to bear, but, from the smallness of the wheels, an extra pressure was also brought upon the journals and bearings of the rollers. The bosses of the wheels which slid upon the upright shafts were also liable to wear, and become loose and shaky. The grooves in the bosses of those wheels, and the ends of the roller shafts which turned in those grooves, and by which the wheels were supported, were no less objectionable. In a machine for working mouldings made for him some years since by Messrs. Forrest and Barr, and also in a flooring machine which he had more recently had made, the wheels upon the roller shafts were much larger in diameter than the rollers. In a line nearly horizontal with the rollers, a shaft extended across the machine between each pair of rollers, which shaft carried a pinion which drove two rollers—a roller wheel gearing into each side of the pinion. When the upper rollers rose or fell, the depth which the teeth of the wheel and pinion geared into each other varied slightly; but as the extreme thickness of wood which passed through the machine seldom exceeded 4 inches, the rollers were not required to rise or fall more than 2 inches above or below the level of the intermediate shaft, and this did not appreciably affect the proper action of the teeth. Within the last twenty-five years he had had in his works in this country and in America eight planing machines, no two of which were constructed alike; but he conceived this mode of driving the rollers to be the most simple and substantial which he had tried or seen. He had placed a number of samples of mouldings upon the table, worked by the machine made for him by Forrest and Barr, which had not been sand-papered, but were in the same state as on leaving the machine, and he thought they would be admitted to be as smooth as if dressed with the finest plane.

Mr. J. RUSSELL said the difference between the planing machines now in use lay chiefly in the gearing of the rollers; and he thought they ought to inquire whether the bevil or spur gearing—as pointed out by Mr. Brownlee—was the best. It appeared to him that the bevil gearing was correct in action, whatever might be the position of the upper roller. With the spur gearing the action was not absolutely correct, but yet it might be sufficiently so for all practical purposes; whilst if the bevil gearing were apt to give way on account of the small size to which it was limited, that would go far to condemn it. They had been told that the machine had worked well, and he would like to know whether the bevil wheels were, in practice, found liable to break. In the event of parties requiring a machine of this kind, it would be well if they could get some information about this—the only point of difference between the various machines. Any practical person who looked at the original machine of Mr. Muir, and compared it with the present machine, would observe that there were, perhaps, very few machines upon which so many improvements had been made. He happened to be at the making of one of the earlier machines at Leith, about the year 1832; and when it was started there was scarcely ever a day passed that a belt did not break. There was a drum and a considerable number of belts in use, and some of them were continually breaking. The pitch chains with the hooks split away the wood at the ends, and detention from that cause was common. In looking at the two machines, great improvements appeared to have been made upon the original one.

Mr. T. DAVISON asked how many adjustments were required in altering the machine to cut from one thickness and breadth to another thickness and breadth.

Mr. BROWNLEE said that to alter the machine to cut a different breadth of board only required the turning of a wheel, every turn giving an eighth of an inch; but in altering the thickness all the tonguelug and grooving cutters had to be changed. The thickness of the board could be elevated, as well as other holding-down rollers or dibber and feed rollers had also to be elevated. The machine had, however, been greatly improved in this respect, by so combining several of the parts that they rose and fell together. In some machines the feed rollers were elevated singly, whilst by various arrangements in others they all rose together by simply turning a wheel or handle. Both of the machines mentioned which he had last had made were so constructed; but in each machine this was effected by a different method, the arrangement by which this was effected in the last having been designed by the makers, Messrs. Smith Brothers and Co. But besides the feed rollers, there were others for pressing the board down upon the plane bed; and those rollers, as far as he was aware, had always been raised separately; whereas, in his last machine, he caused them to be supported in a frame, which frame was itself carried by the four bushes of the adjoining feed rollers, along with which it rose and fell, and thereby those rollers rose and fell along with the feeding rollers. By this arrangement not only was time economised, but an invulnerable pressure was also brought upon the back of the board, which was otherwise ever changing with inequality of thickness when those rollers were held down by springs, as was usually the case.

At the fourth meeting of the Session held on the 22nd January, the PRESIDENT in the chair, the SECRETARY read the following communication which had been addressed to the Council of the Institution:

"A great desire having been expressed by many members of the various learned and scientific societies in Glasgow, to make some efforts to obtain better and more suitable accommodation for their valuable and increasing libraries and other property, and for their meetings and business rooms, a preliminary meeting was held on the afternoon of the 31st December, in the Andersonian Library, by a few gentlemen connected with the Philosophical Society, Institution of Engineers, Architects, Archeological, and Geological Societies, for the purpose of taking steps to obtain the formal concurrence of all the societies to this movement. After fully talking over the matter, which met with warm approbation, a small committee was formed to bring before your society and others the following suggestions, and, if meeting acceptance, to request that you will appoint a committee of three of your number at your first meeting, to form a joint committee, for the purpose of carrying out, in this matter, the wishes of the different societies."

Among the suggestions were the following—
That all the learned and scientific societies of Glasgow be brought together into one building, to be built in some suitable situation, and to be named "The Royal Institution Buildings," with a Royal Charter.

The societies only to be so far united as to carry out the desired object of mutual accommodation and assistance at the least joint expense.

Each society will retain and maintain its own library and other property, with its own distinct management and funds, as at present.

All the libraries to be kept together in one library hall or reading-room, under the principal librarian, with assistants—the library-room to be fitted with every comfort and convenience for consulting, reading, and writing.

A large hall for general meetings to be provided, and such smaller rooms as each society may require.

A general museum for the reception of models and drawings—mechanical, architectural, or otherwise—and geological and archeological collections.

It is intended to raise a sum of money to carry out these objects by donations. It is believed there are amongst the wealthy citizens of Glasgow a sufficient number of gentlemen who will appreciate the motives with which the appeal will be made to them, and by their liberality enable their fellow-citizens who walk in the honorable but less lucrative paths of learning and science, to raise a building that will not only be an ornament, but a monument, to show that there is a taste and a desire amongst our merchant princes above that of merely making money.

On the recommendation of the Council, Mr. Johnstone, President, and Messrs. A. McOnie and R. Bruce Bell, members of Council, were unanimously appointed to represent the Institution, and co-operate with deputations from other societies, in promoting the objects referred to in the circular.

Cordale's sheet-metal splitting machine was then exhibited, and described by the SECRETARY, who explained that the improvement comprised in it were provisions for dividing a sheet into two or more parallel strips at once, and contrivances permitting of the easy adjustment of the parts for cutting different widths. The cutters consisted of square-edged steel rings mounted upon two parallel shafts, and working slightly past each other—the rotation of the shafts causing the cutting rings to draw the sheet through whilst cutting it. The machine, which was of very small size, was shown in action cutting sheet iron, of about 18 wire gauge, into three strips at once—the strips being delivered with square, clean-cut edges, and without twist.

ON THE INDURATION OF STONE.*

THE destructive influences at work in great cities upon stone are rather complex. But many buildings in country districts where the air is pure, and reveals to chemical analysis nothing but its normal ingredients, suffer greatly from decay; such decay, however, is nothing more than the "weathering" to which the particular kinds of stone in their natural mode of occurrence in rocks and hills would have been subject. Of the natural agents of destruction water and carbonic acid are those, the influence of which is exerted also upon the stones of buildings; for we may dismiss from consideration, in the present case, the sure but slow process of disintegration effected in stone by mosses and lichens, and the higher forms of vegetation; and also the more rapid destruction caused by wind and tempest. Water, as a destructive agent, acts not only chemically, but mechanically; it actually wears away by friction certain particles of stone, at the same time that it exerts its solvent action upon other particles, and upon the cementing material which binds them together. The more porous the stone, the more rapid is this action; for compact crystals of carbonate of lime, &c., offer a very small surface to this destructive influence of water, compared with that offered by a mass of minute particles separated from one another by an infinitude of open spaces. Even where the compact crystals of carbonate of lime, sulphate of lime, carbonate of magnesia, or even silica occur, they are often united together by a cement which, from its non-continuity, is easily acted on by water, disintegration of the stone following as the result. But it may be asked, how can the atmospheric water dissolve this cementing material, seeing that, if it were carbonate of lime, each grain would require 11,000 grains of water for complete solution? Had, indeed, this cementing material no other agency to contend against save that of pure water, its permanent stability need not be doubted. But, unfortunately, rain water is not pure water; it invariably contains a certain quantity of dissolved carbonic acid gas, as well as traces of nitrate and carbonate of ammonia, and, occasionally, of free nitric acid. Of these materials it is, however, the carbonic acid whose action is most pronounced. This gas, of which 100 volumes of water, at the ordinary temperature and pressure, are capable of taking up 100 volumes, dissolves the carbonates of lime, baryta, strontia, and magnesia with great ease; one part of carbonate of lime, requiring not 11,000, but only 800 of water saturated with carbonic acid, at the ordinary temperature and pressure, for solution. And their action, it must be remembered, takes place not only when rain is actually falling, but also in a lesser degree at many other times, since the air in England contains, on the average, in 10,000 volumes, 150 volumes of watery vapor, and four volumes of carbonic acid gas. Rain water often holds in solution several volumes of carbonic acid in 100 volumes of water, and is capable of retaining 100. But rain water collected, in, or near, large towns, contains several additional impurities, such as sulphate of ammonia, organic and carbonaceous matters, traces of fixed inorganic salts, and occasionally sulphurous, sulphuric, hydrochloric and hydro-sulphuric acids. Of these bodies sulphurous and sulphuric acid are more especially injurious, and their occurrence in the air of large towns complicates the destructive work going on in the buildings. Disregarding those curious and happily exceptional cases, where, from local and special causes, a considerable formation of the nitrates of lime or magnesia—extremely soluble salts—has taken place in stone to its serious damage, I would refer briefly to the extensive injuries suffered by buildings in consequence of the action of sulphurous and sulphuric acids upon them. Both these acids change the carbonate of lime or magnesia of the stone finally into sulphate of lime, or magnesia—the former a salt which is just two and twenty times more soluble in water than the original compound. Not only does this greater solubility of the sulphate of lime make it more open to attack, but the very transformation from carbonate to sulphate of lime causes a looser re-arrangement of the particles, and so favors disintegration. But though one part of sulphate of lime requires rather less than 500 parts of water for solution—a small proportion of solvent compared with that required by carbonate of lime (11,000 to 1)—yet sulphate of magnesia, into which the carbonate of magnesia contained in many building stones would be transformed by a process identical with that last mentioned, is an extremely soluble salt. There are other cementing materials in addition to sulphate of lime and the carbonates of lime and magnesia, which are less liable to injury from atmospheric influences. The chief of these are silica, silicate of lime, silicate of alumina, and per-oxide of iron.

The effects of the several destructive agents to which I have just referred may be traced in the change of appearance and composition, suffered by the decaying stone. Water and carbonic acid wear away the cementing material, and the softer layers and veins of the stone, causing disintegration and flaking off; while sulphurous and sulphuric acids aid this action by changing less soluble into more soluble salts, and by re-arranging the changed molecules into a less compact and more friable form. Chemical analysis discloses this latter change in a very interesting manner. Specimens of stone which, when freshly quarried, contained a mere trace of sulphate of lime, show, after a single year's exposure to the London atmosphere, a notable quantity of that salt; and this proportion often goes on increasing from year to year, being formed more rapidly than it is removed by the solvent action of rain water. In a magnesian limestone sulphate of magnesia is likewise produced; and in such quantities that, by the disruptive force of its crystallisation and subsequent efflorescence upon the surface of the stone, small particles of the material are torn off and fall away. This action closely resembles that caused by the absorbed water of the stone at the moment of its freezing. When we consider the vast bulks of air which in passing are continually bringing their influences to bear upon the exterior of a building, we need not be surprised that a marked effect should be experienced from the presence of so small a proportion as from 20 to 30 parts of sulphurous and sulphuric acids in 100,000 parts of air. In decaying stones two peculiarities are generally noticeable. The decay is often greater under mouldings, cornices, capitals, and other projecting parts of the buildings, than in more exposed situations; also, while one portion of a stone may remain sound, another portion will rapidly soften and fall to powder. This latter effect seems due, not to any difference in the chemical composition of the several parts of the pieces of stone, but rather to differences in the state of aggregation of its particles. In the former case the comparative immunity from decay of certain exposed portions of a building appears to arise from the heat and air drying up and evaporating the corrosive solution which falls upon them, while this liquid is retained longer in sheltered corners, and there exerts a more powerful and more enduring effect.

II. From what I have already said, it will be seen that in order to prevent or remedy decay we have to guard against not only certain chemical, but also certain mechanical actions. There are two general principles, either of which, carried into practice, seems likely to effect this protection more or less completely. Either we may, firstly, prevent all destructive changes by covering up the building in a coating of some unalterable substance; or, secondly, we may so modify the chemical and physical condition of the corrodible surfaces and parts adjacent thereto, as to render stone, previously liable to decay, as enduring as the most impervious rock.

As to the principle involved in the first of those theoretical general plans, it is evidently less advantageous in some respects than that of the second; for we have always to fear the risk of the protective coating, wherever it may be, proving partially imperfect, and so permitting the injurious actions to occur as before, only hid from view. The processes founded upon this principle have likewise another drawback, involving, as they do, an addition to the stone rather than an improvement of it. This addition generally necessitates a change of some kind in the appearance of the stone, whether that change be one of form, color, or texture. The second general principle may, however, as I shall endeavour to show, be carried out successfully into practice without causing these or other defects, and its adoption enable us to fulfil, partially or wholly, the following conditions:—

1. Any process to be thoroughly effectual in preventing or arresting the decay of building stones must be easy of application and moderate in cost.
2. It must render absorbent stone less porous and less permeable by water, and, at the same time, must counteract the influence of injurious bodies in the atmosphere.
3. It must effect the consolidation of stones in which the particles are loosely aggregated, and it must harden stones easily abraded by slight mechanical means.
4. The color and texture of the stone must not be materially altered by the process.
5. The protective material must not constitute a mere film upon the surface, but must penetrate to some depth; nor must it be liable to such contraction of the surface as shall cause a separation of particles from the mass of the stone.

* Read before the Architectural Association, on January 31st, by Mr. A. H. CHURCH, B.A., F.C.S.

PROPOSED WIDENING AND ENLARGEMENT OF THE LONDON AND BLACKWALL RAILWAY.—The plans for the widening and enlargement of this Company's line show that the proposed improvements will commence at Church-lane, Whitechapel, and St. George's-in-the-East, passing over Frederick-street, and terminating at Sarah-place, further extending over Cannon-street-road, running by Cross-street on the east, and Charles-street, and terminating at Little Union-street, St. George's-in-the-East. Additional lands are also to be taken for the accommodation of the increasing goods traffic and in connexion with the various stations, buildings, and the branch line now in course of construction to the London Docks; the cost to be defrayed out of a sum of £300,000, which the Company are already empowered to raise by issue of preference shares.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

6. The protective material must be generally less amenable to injurious atmospheric influences, and particularly less soluble in water than the original materials of the stones which it replaces or encloses.

7. No soluble salt, especially no efflorescent or crystallising salt, must remain in the stone as one of the products of the protective process.

These conditions are some of the most important, but they are given here rather as suggestive than exhaustive.

III. We now come to the consideration of the remedial and preventive measures proposed: these I will divide, as before suggested, into two classes; the first including processes where a coating or film of oily, bituminous, waxy, earthy, or other solid matter is applied to the surface of the stone; the second including all those where one or more solutions (the solvents being volatile) are applied in order to produce, by their mutual action or by their action on the stone, an imperishable protection to each particle.

1. I have already stated my conviction that processes belonging to this first division do not, and cannot, fulfil the necessary conditions of success. I shall point out the reasons of this conviction presently. I would now briefly notice, or, rather, mention, those processes in which an organic or solid body is employed. And here I must apologise for giving little more than a catalogue of certain examples of the more important processes of each kind, without entering into detail; but these are so easily accessible in all their completeness elsewhere that I should have been obliged to curtail my own observations on the subject under consideration.

I do not think there is any valid reason why I should not dismiss the processes of the first division in a very few words: their general disadvantages are so evident. The greater number depend upon the application of an organic substance to the surface to be protected; and, for the most part, of an inflammable substance, the presence of which on every part of a building seems undesirable. Among the materials suggested, we find the following:—Beeswax, applied either melted or dissolved in some solvent, such as turpentine; certain resins to be applied similarly; linseed, or other drying oils, either alone or in combination with sulphur, and bitumen; this latter in a state of solution in a volatile liquid. All these plans fail to fulfil several of our conditions. They alter the color more or less injuriously; the protective material is little more than a mere coating of paint, behind which destructive processes may go on as before, and it has no true adhesion to the stone, and is generally subject to decay itself. Gelatine and starch have actually been suggested as preservative materials, but they are evidently—the latter especially—subject to rapid destruction. Numerous suggestions as to coating stones with various solid earthy and mineral matters have been made, but they conceal rather than cure defects, and can have little or no effect in counteracting chemical injuries.

Among such processes the employment of a thin wash of Atkinson's cement in water has been tried with success on open porous freestones in Yorkshire; it would, however, be quite inapplicable to the surfaces of compact limestones.

2. Among the processes of the second division the application of silicates in some form or other has been over and over again suggested and carried out. The simplest and earliest process consisted in the application of soluble or water glass to the stone. An immediate hardening occurred, and a partial protection was achieved. But the decomposition of silicate of potash (for silicate of soda is inadmissible, on account of the disruption of the stone caused by the efflorescence of the soda salts produced) was very precarious; the carbonate of lime did not always act upon it with certainty, nor did the carbonic acid of the air separate from it the silica at a sufficiently rapid rate. Then a decided improvement was made in the process. The surface was first washed with silicate of potash, and then with chloride of calcium or barium. The silicate was indeed at once decomposed within the pores of the stone, but an equivalent quantity of a soluble salt was formed at the same time—an unnecessary and even injurious product. In point of fact the stone becomes so much less porous after this treatment, that it is impossible to wash away this soluble salt from it, although we constantly meet with the statement—"The chloride of potassium formed can be readily removed by washing." The same process in its essential features has been adopted in the formation of artificial stone. The tendency of the soluble salt necessarily formed in this plan to crystallise and rupture the surface, is one of the drawbacks to its use. Soluble silicates have also been applied in compound processes, where organic bodies have been likewise used; and also in combination with the carbonates of zinc and lead.

Among the other purely chemical processes I have only time to notice four. A solution of hydrofluoric silicic acid, followed by one of caustic baryta, is applied to the stone. A hardening occurs, and the stone is rendered, if a limestone, hardly alterable by acids; yet the surface is abraded by the violent effervescence caused by the hydrofluoric silicic acid; and a saline impurity is introduced by that chemical as ordinarily made. A solution of silicofluoride of aluminium has also been tried with symptoms of success, but this liquid, like hydrofluoric silicic acid, produces an effervescence with limestones. A third process consists in the use of superphosphate of lime, which, by acting upon the carbonate of lime of the stone (an action accompanied by effervescence), forms neutral of lime, hardening the stone, and rendering it less absorbent. The simplest of all these processes is the application of a solution of pure silica in water. This fulfils most of the conditions of success; it does not alter the color nor cause any effervescence, but, as a protective material, its action is inefficient; and, with very soft stones containing much carbonate of lime, it has a tendency to contract upon and injure the surface, without penetrating far into the substance. There is still another process, the nature of which I am, I regret to say, not at liberty at present to describe, but which, so far as I can see at present, theoretically and practically fulfils every condition of success. The process to which I refer will shortly be made public, and I believe a more extensive experience of it will strengthen my opinion of its merits.

IV. I need not detain you long with my observations on the effects, as revealed by chemical analysis and microscopical examination, of the several applications to which I have referred. In consequence of the general presence of a larger or smaller quantity of water in stones, this water existing in a state of mechanical rather than chemical union, a substance like oil, wax, fat, paraffin, resin, or bitumen can never come into sufficiently close contact with the particles of stone to be in intimate union with them, and it makes little difference whether the oily substance be applied hot or cold. Where the whole of the mechanically combined water has not been driven out by long heating of the stones previously to the application of the melted wax or oil, the surface of the stone and the subjacent parts present, when examined in thin sections, a great number of minute air spaces, amongst which the oil or wax globules lie scattered. These processes offer, therefore, no chemical, and only a partial mechanical protection against the ravages of water, carbonic and sulphuric acid. The oil, if a drying oil, like linseed, resinifies after a time, but does not form a coherent protective envelope for each granule even then. The same remark applies to wax, resin, paraffin, and bitumen, &c.; and where an excess of these materials is present it forms a coat of paint upon the surface, liable at any time to scale off, owing to its incompatibility with and lack of adhesion to the surface beneath. Where a stone can be thoroughly baked, so as to drive off every trace of water before being treated with oil, &c., the effect produced when examined under the microscope is manifestly more satisfactory, and the few trials that have been made have been attended with considerable success; but of course such a plan is impracticable on the large scale, although, if there should occur cases where it was admissible, crude paraffin suggests itself as the most unchangeable material for the purpose. Paraffin, however, suffers a most marked contraction when passing from the liquid to the solid state, and this might prove a slight drawback to its use. When examined carefully with the assistance of the microscope, stones coated with any of the various oily preparations of Class I. present a dirty appearance—an appearance which is often conspicuous enough to the naked eye, and depends on the stickiness of the surface; and in the case of specimens to which a solution of sulphur in linseed oil has been applied, crystals of sulphate of magnesia and sulphate of lime may be traced. These sulphates arise from the gradual oxidation of the sulphur in the oil. We have already pointed out how prejudicial their formation is, and any process causing or favoring it is inadmissible in consequence. I have obtained portions of decaying dolomite from two or three different buildings in London, and I have remarked most conspicuous disruptive effects produced by the crystallisation of sulphate of magnesia within them. This salt, in crystallising, takes up large quantities of water, and expands greatly in so doing. The effect of a protective coating of a mechanical character upon dolomite in this condition is very slight. The crystallisation proceeds, and finally throws off portions of the hardened oily or bitu-

minous coat, which in their turn drag away small adherent particles of stone. The merely mechanical protection afforded by washes of cement and similar materials is subject to failure from the same causes.

As to the effects on building stones of the chief processes of the second class, they are extremely varied. If salts of soda be employed, such as the silicate, then carbonate or sulphate of soda or chloride of sodium appears as a white efflorescence. Not only is this unsightly, but, if it be closely examined, a minute particle of stone torn off from the surface will be found upon the summit of each hair-like crystal constituting the efflorescence. If potash salts be used in the protective process, efflorescence does not generally occur, but the surface remains long damp, and when it has become dry (if this should ever take place), cavities would be left where the soluble salts have been washed out by the rain. Experiments on a small scale have proved to me that this is really the case. Furthermore, this washing out or cleansing process by the action of rain is a very slow one, and it will be found, on applying suitable tests to the stone prepared by any of the processes where an alkaline silicate has been used alone, that they invariably reveal the existence of a large quantity of alkali. Where a wash of alkaline silicate has been followed by a wash of chloride of barium or calcium, not only must a quantity of soluble salt equivalent to the insoluble salt be formed, but, if the chloride of barium or calcium be applied in excess, a still larger quantity of useless material will be introduced. Chemical examination of stone prepared by this process show how completely impracticable the attempt is to regulate the absorption of the two liquids properly. A porous stone saturated first with sulphate of alumina and then with caustic baryta, two solutions which, if applied in exactly equivalent proportions, should yield no soluble, but two insoluble compounds, presented, under the microscope, an immense number of most minute non-coherent particles of sulphate of baryta and alumina, easily removed by the mechanical action of water. Hydrofluosilicic acid produced a violent effervescence on the surface of stones containing earthy carbonates as bases, destroying the fineness of the surface, although it appears to exert a hardening effect, particularly if succeeded by the application of caustic baryta in solution. In the case of sandstones, hydrofluosilicic acid destroys the cementing material if it be carbonate of lime, and the surface is not rendered harder but actually disintegrated. The most interesting results are obtained in the examination of stones which have been treated with a solution of silica in water. This solution, which I have mentioned already as obtainable with great ease, owing to the recent discoveries of Professor Graham in Dialysis, and may be prepared of various degrees of strength, up to about 4 per cent. 4 parts in 100 of dry flint or silicic acid. When this solution comes into contact with carbonate of lime in any form, if strong, it gelatinises; if very weak, it forms with a portion of the lime, a silicate of lime, a very permanent and insoluble compound. By a similar action carried to its extreme limit, by which nearly all the original lime is removed, and nothing left but silica, corals and shells, and other bodies are now found (in the triassic red conglomerate of South Devon) converted into flint or hornstone. When this solution of silica is applied alone, and in a pure state, to a surface of stone in order to preserve it, if the stone be naturally soft and friable—chalk for instance—the result is in no wise favorable, for the silica solution first partly gelatinises on the surfaces, then as the gelatinous film dries it contracts, and, in contracting, draws away small particles of the surface with it; the film finally falls off. Its action under other conditions seems less unfavorable. But I have not examined the subject in all its details as yet. As to a solution of fluosilicate of aluminium, I have not had sufficient experience to pronounce a definite opinion as to its effects on stone; theoretically, the probable principles of its action are satisfactory. The solutions of lime and magnesia in water are so weak as to produce no appreciable alteration of any kind in materials submitted to their action. There is another process, the tangible results of which seem favorable. I refer to that in which solution of silicate of potash and aluminate of potash, of particular strengths, and in particular proportions are mixed, and the mixture then applied to the stone. If the mixed solutions be kept some hours previously to their use, they solidify into a glassy mass, containing silicate, alumina, and potash; this latter soon becoming carbonated. The mixed silicate of alumina, and hydrate of alumina produced, resembles very closely some of the varieties of the mineral allophane, and collyrite, neither of which are distinguished by durability or cohesiveness; yet, in actual practice, the artificial compound seems to have considerable binding power, so that powdered Caen or Bath stone may be effectually reconsolidated by its means. The presence of a large quantity of potash in the preservative solutions of course prevents the process from fulfilling our 7th condition, but the inventors are endeavoring to reduce the amount of soluble potash salt produced in the reaction; at present, the alkalinity of specimens prepared according to their plan is very marked.

NEW RAILWAY STATION AT STAFFORD.

A NEW railway station is on the point of completion at Stafford, in place of the dirty inconvenient sheds which have so long not accommodated travellers at this busy portion of the line.

The new station is of considerable extent. The whole extent of the platform being 740 feet; only 540 feet of this, however, is covered in. The main block of building on the up-line consists of a booking and telegraph office, flanked by dining, refreshment, and waiting rooms. The booking-office, an apartment 50 feet broad, is furnished with a semicircular screen, which, with a slight partition, divides the first from the second and third class passengers. To the left is a large dining-room and refreshment-room, while to the right run in succession the first and second class waiting-rooms for ladies and gentlemen respectively. The waiting-rooms are not very large, but as there are four upon each side, they will, perhaps, be found sufficiently spacious. Above the refreshment-rooms are the offices of the goods' superintendent for the district, while above the waiting-rooms are those of the permanent way manager. The platforms, which are paved with Staffordshire tiles, are covered in with iron and glass roofing, which extends over the nearer line of rails, and will consequently shelter the passengers while alighting. From a pipe, that runs the whole length of the roof, depend gas lamps. Flights of steps on each side of the booking office lead to the crossing bridge. On the down-line the central apartment is a first-class refreshment-room, fifty feet in length, faced at either end by a small office, which, with its projecting window, serves to break the monotony of the long length of building. At the further end of the first-class is a second-class refreshment-room, 43 feet in length. The waiting-rooms upon this side are equally distributed on each side of the central refreshment-room, the first-class being at the nearer and the second at the further end. At the ends of the platform on each side are covered sidings, for the reception of carriages from the North Staffordshire, the Shropshire Union, and any other branch lines which may be connected with the station.

New engine and goods sheds—the latter 150 feet in length—have been recently erected. The passenger station itself has occupied about seven months in erection.

The total estimated cost of the building is over £20,000. Mr. Baker is the architect for the Company; the contractor is Mr. Parnell, of Rugby.

THE new machines constructed for boring through the Alps, have been tried with success; 730 metres have already been pierced on the French side, and 950 metres on the Italian side; consequently nearly 1,700 metres, out of 12,000 metres, about seven miles and a half, have to be bored through.

PROFESSOR SMIRKE'S LECTURES ON ARCHITECTURE AT THE ROYAL ACADEMY.—LECTURE III.

IN my last lecture I touched upon a few of the more interesting objects on the shelves of the British Museum, that have special reference to architecture. The subject is well rich in material, for I doubt whether any library in the world equals that in the British Museum, either in extent or value; and I purpose, on a future occasion, to pursue the subject, and continue, in a cursory way, to direct your attention to such other works as seem to me best calculated to impart instruction or to excite interest in the minds of those engaged in the pursuit of architectural knowledge. But I will this evening call your attention to another library, which may be, in some sense, regarded as a public library, but which is very different, no doubt, both in respect to extent and value, from that to which I have already adverted. I refer to the library which forms an important part of the Soane Museum. Being a library wholly formed by an architect, and bequeathed by him in trust for the express use of architects, it seems to have special claims on my attention here, and those claims are enhanced by the long connexion that existed between this Academy and Sir John Soane.

It is by no means my intention or desire to constitute myself the apologist or the critic of that, in some respects, remarkable man. With his personal peculiarities—with his temper and disposition, with his foibles and eccentricities—we have nothing whatever to do here. Let those who have no defects of temper or of character throw the first stone; I certainly will not venture to do so.

As an architect, he undoubtedly was, in some respects, remarkable. He sought for novelty and originality in whatever he did, and not unfrequently he succeeded in attaining the object of his search. He was very deficient in greatness of style, delighting rather in small conceits and whimsical contrivances to produce effect. Though he can hardly be said to have possessed genius in the higher sense of that word, he had much ingenuity. He moreover had some aspirations after the attractive but hazardous quality of the picturesque in architecture. If I have declined, on the present occasion, to be the censor of his personal peculiarities, so I would equally refrain from investigating the motives which may or may not have influenced him to devote his museum and library to its present semi-public purpose. Let us take the fact as we find it, and admit at once that the bequest was a liberal contribution towards the education of his professional posterity.

It pleased Sir John to apply for and obtain the sanction of Parliament for the formation of a trust, imposing on the trustees certain very clearly-defined duties, which duties the trustees, by accepting their office, became morally and legally bound truly and faithfully to perform, at all events until the same authority that imposed them shall have thought fit to modify or annul them.

I have ventured to say thus much publicly to you because the trustees have not unfrequently been made the subject of considerable misrepresentation. Sir John evidently desired to limit the examination of his collection to those only who studied architecture either as professors or amateurs, certainly not intending to throw it open to indiscriminate view. That such was his intention is conclusively shown by the particular conditions which he so carefully imposed; and a trustee, like an executor, can by no means depart from, or even vary, a single condition laid down by the testator without incurring the very serious charge of neglecting or exceeding the powers of his trust.

The museum, properly so called, will not engage our attention this evening. Those who have made themselves acquainted with its contents know that they are of a very miscellaneous character, comprising some objects of great value and interest, and some of a most trivial and insignificant nature.

It is to the library only that I am now about to advert, avoiding, as far as may be possible, such objects as exclusively concern the mere antiquary, inasmuch as the time at our disposal is very limited, and as the special purpose of these lectures is, by the very constitution of the Academy, confined to such objects as are calculated to further the professional education of the students. This same consideration excludes us also from advertence here to the rich stores of mechanical knowledge which are to be found on the shelves of this library.

That Sir John was perfectly aware of the high importance to every architect of a thoroughly practical knowledge of building is sufficiently apparent from the contents of his library, and was repeatedly dwelt on by him in the lectures which he delivered from this place. But it is to his books on architecture as a fine art that I am bound here to confine my attention; and it is certainly to the works of this character that the library owes its chief attraction, and from them it derives its chief value. It comprises nearly every architectural publication of value that had appeared during his own professional career, down to the period of his death, in 1837, as well as a large store of books of early date. Among the earliest in the catalogue you will find Alberti's "*Libri decem de re Edificatoria*." Of this well-known book there are here six editions, but among those I do not find the original and earliest Latin edition of 1512. A folio edition, in Italian and English, appears to be that which its owner read with greatest ease, as it contains many marginal notes by him, and other evidences of his having carefully read it.

On a former occasion I have, from this place, expressed my admiration of Alberti's works at Rimini and elsewhere. His church of San Francisco is in the best style of the early Renaissance, before it had degenerated into the commonplace manner of the following century. It is worthy of note that Vasari touches but slightly, and with some apparent indifference, upon this work, although he must have been especially familiar with it, seeing that Vasari dwelt some time in Rimini.

In truth, Vasari, excellent as he may be as a biographer, had, as an artist, but little genius, and he was unable to appreciate the somewhat dry, antiquated manner of Alberti. That artist not only possessed undoubted talent as a practical architect, but remarkable merit also as a writer. His book is full of valuable remarks, and attests at once his good sense and his erudition.

What is also specially worthy of our observation is, that he appears, in an eminent degree, to have united a minute and accurate technical knowledge with a fine æsthetic feeling. The distinction which he draws between beauty and ornament is, I think, most just and true. "Beauty," he says, "is something lovely, which is proper and innate, and diffused over the whole body, whilst ornament is something superadded or adventitious, rather than innate."

Alberti, and, I might say, Alberti's school—the school of the Early Renaissance—well understood the distinction between beauty and ornament.

The vulgar of all ages, countries, and ranks are apt to think that ornament means beauty, and that in order to be beautiful we must needs be lavish in ornamentation. This great error leads directly to that excess which degrades art, whether it be architecture or her sister arts. It was excess which marked the decadence of Roman and of Medieval art; and it was the disfigurement of excess which stained the purity of the Early Renaissance.

I speak, as it is fitting and becoming that I should speak, with great reserve, and in the most general terms, when touching on the state of our art in the present day; but I think I am only fulfilling a plain duty in denouncing the tendency to a meretricious use of ornament, which may, perhaps, be discerned amidst the conflict and rivalry of prevailing tastes.

No doubt, in this country, the greatest diversity of feeling exists in matters of art; so impatient of all restraint is our countryman, that there is no privilege that he more freely exercises than that of differing from his neighbour in opinion; and in taste especially, we all proverbially and most widely differ.

Some will teach us that ornament alone is architecture, and that a building without ornament is but handicraft work, necessarily devoid of art, and beneath an artist's attention; whilst others will look with equal contempt upon all mere ornament as a frivolous and puerile inutilty, altogether unworthy of any serious regard. I believe that in this case, as in most others, each of these extreme opinions is equally remote from the truth.

At all events, I am confident that, however we may be led away by our imitative habits into occasional extravagancies and unseasonable excesses, the natural bent of the English mind is towards moderation in the use of ornament.

Flagrantly as we may sometimes err, and wild as may be the caprices we may sometimes indulge in, still, in the main, the tendency of public taste is of a plain, grave, and practical character; and I am very greatly mistaken if, when we regard, either on this side of the Atlantic or the other, the overloaded piles of enrichment which constitute the pretentious façades occasionally presented to us for our admiration, by far the majority of us fall into the unimpassioned and calculating inquiry of "*cui bono?*" Not only does this excess

offend, as it appears to me, the naturally simple taste of this country, but it is plainly at variance with the lessons daily taught us by our English climate. Moistness is the normal condition of our air, and clouds are the normal clothing of our sky; for at least two-thirds of the year our buildings are constantly liable to be drenched in rain, whilst for the remaining third they are subjected to the still severer trials of frost; and thus, in this matter, the dictates of common sense are in perfect harmony with the suggestions of our natural taste.

I perceive that the short and pointed sentence which I have quoted from Alberti has led me into a somewhat verbose diversion. In this respect I am failing to profit by the example of my author, whose style of writing is as free from verbiage and prolixity as his style of architecture is exempt from frivolous and intrusive ornament.

The next book which comes to hand is of a very different character. Indeed, one is sometimes almost led to feel surprise how books so widely asunder in their character and quality can submit to the close and constant juxtaposition that they are subjected to on our bookshelves.

The book, I say, which I now take up is that of Dieterlin's "*Architectura de Constitutione, Symmetria, ac Proportione quinquæ Columnarum*," published at Nuremberg in 1598. It bears sad testimony to the rapid deterioration of art, and to the special proneness to a corrupt excess among our German neighbours. In the extravagant and grotesque scrolls and cartouches which abound in this volume, we see at once from whence were derived the strange ornaments of our Elizabethan and Jacobite styles, although those styles as displayed in our own country might lay claim to the character of simplicity and sobriety by the side of these wild enormities of Dieterlin.

In a former lecture I expressed my belief that much of the degradation of architecture in the seventeenth century might be due to the practice at that period of the same individual pursuing all the three sister arts. Whilst any remnant of the purity of early art, and of the good sense of the early artists, survived, this combined cultivation of the fine arts was not attended by any evil consequences. On the contrary, the arts lent to each other that mutual aid from which they derived mutual advantage; but it was when the torch of genius had died out and our art fell into decay, that the dangers consequent on this union began to develop themselves.

When men ceased to understand the true scope of each art, and to recognise their respective limits, they lost the power of designing well in any art. The sculptor and the architect became merged in one artist, who was fain to build up his clouds, and to construct celestial glories as if he was erecting a stone wall; whilst, on the other hand, he designed buildings wanting many of the essential attributes of real architecture—buildings, indeed, that could only be made to stand by dint of ties and other hidden mechanical contrivances. The physical impossibility of executing in solid materials the architectural vagaries of Dieterlin, as exhibited in the designs before us, is sufficient evidence of his inability to design architecture. He seems to have been utterly regardless of the fact that architecture is a constructive art subject to static and dynamic laws. Far different was it in the good times of the previous century. I believe we may defy the most scrupulous critic to point out in any one picture of Raffaele's, of G. Romano's, or of M. Angelo's, a single building or fragment of architecture, which might not with perfect facility be executed, line for line, in stone or timber.

I touch with great reserve on the confines of my neighbours, and should regard it as presumptuous on my part to affect the critic in the sister arts; but still I would venture to urge on the students of the painting school that in the architecture which they may deem it proper to introduce in their pictures they should never be unmindful of the practicability of the structures they represent. It appears to me that it is just as incumbent on the painter or sculptor to give to his building a suitable and sufficient base as it is to place his figures properly and naturally on their feet. The error of representing an impossible structure is, in its degree, just as great as that of representing a man in an impossible attitude.

I must, however, at once revert to the Soane Museum. I find on the shelves a volume of drawings, chiefly executed on vellum, described in its manuscript title as "*Disegni di Architettura del Anno 1400*." It is a curious volume, the history of which I know nothing, although of its authenticity, for various reasons, there can be, I think, no reasonable doubt. The execution of the drawings is very indifferent, and there is little attempt at correct delineation, and yet there is not wanting freedom and a certain amount of manual and almost artistic dexterity. The volume seems to do for the fifteenth century what Willars de Honcourt's book of drawings, recently submitted to the Institute of British Architects, does for the thirteenth century.

There are between sixty and seventy drawings, but none bear any titles, and they are probably original studies or exercises in architectural and ornamental design. A very little correction and modification would make some of these designs elegant compositions. I have upon a former occasion observed upon the absence of the regular orders of architecture in the early works of the Renaissance. This volume remarkably corroborates my statement. There is not, I believe, a single instance in the book of a dominant order determining the proportions of a building. Columns there are in abundance, and of a great variety of whimsical forms; but in all cases, I believe, each tier of columns and arches represents a separate floor. A constant use of arches and niches, a prevailing habit of panelling, and enriching the panels with arabesques, as on the sides of square columns and pilasters, and a habit of covering all vacant spaces with square and circular panels and medallions, filled in either with slabs of colored marble or with foliage, generally in somewhat flat relief—these appear to be the prevailing distinctions of the quattro-cento style, which stands out with very marked differences from the styles immediately preceding and succeeding it.

Another book, which I must not pass by, is a fine copy of the earliest edition of Philibert de l'Orme's Architecture, bearing date 1567. Under the auspices of Catherine de Medicis, he may be regarded as the introducer of the Renaissance into northern Europe. She came of a race eminently distinguished in the history of art, and the author in his dedication eulogistically refers to her as delighting in architecture, and as sketching with her own hand the noble palaces which she caused to be erected.

It is curious to find at this early period the author groaning over the degeneracy of his profession, and complaining how few true architects there then were. Some self-styled architects were, he says, but mere "master masons," whilst others were but geometicians, or men addicted to the literature, but neglecting the practice, of their profession. His imaginary portraiture of the head-ideal of an architect savors of the quaint, allegorical taste of his time. He would represent an architect, he says, (and there is an illustrative diagram of such a man) with three eyes: one for the observation of divine things and the works of God; the second for the careful observation of things present and around him; and the third, for looking into the future, foreseeing, and so providing against coming evils. He should also have four ears, indicating that it more behoves him to listen than to speak. Four hands should be given to him, that he might be the better able to do all that is required and expected that he should do; whilst his feet are to be winged, pointing out that he must be of quick intelligence, and rapid in action. There are many other things worthy of observation in this curious volume; but I must hasten on to others.

I find a volume of original drawings by Carlo Fontana, formerly in the library of Paine, an eminent architect of the last century. It represents the state, at that period, of the Coliseum, at Rome, and Fontana's supposed restoration of it, with his suggestions, certainly not a happy one, for the erection of a church within the area of the amphitheatre, to be dedicated to the Christian martyrs who suffered there. I need scarcely say that this monogram on the Coliseum is greatly inferior to that unpublished work on the subject existing in the British Museum, to which I directed your attention last week. These drawings, of the seventeenth century, by Fontana, are very neatly and ably executed, quite free from the dry hard manner prevalent among architects at a later date. The lines are in brown, and the shadows delicately indicated with a cool neutral wash, probably Indian ink or some color equivalent to it. This mode of execution was retained throughout the last century, for I find here a large folio volume containing original drawings by Wren and others of his time which are all similarly treated. Some, also, in the volume attributed to Inigo Jones are so executed.

The use of a brown outline with cool shadows was, I believe, pretty general among English as well as foreign artists up to quite recent times, and it is, perhaps, doubtful whether the modern substitution of brown sepia shadows with Indian ink outlines can be regarded in any respect as an improvement.

Among the treasures which Sir John considered to be worthy of a place in the strong

DOORWAY OF MOSQUE AT KHOSH DINISSAR, MESOPOTAMIA.

room of his museum, I find a Roman missal of the early part of the sixteenth century, illustrated with miniatures of the greatest deficiency by Lucas van Leyden and his scholars. It is worthy of remark that all the architecture and ornamentation with which these miniatures are elaborately enriched, are, throughout, very distinctly Gothic in style; late, it is true, but without any admixture of classic taste, and yet this artist died in 1533, and was therefore contemporary with Raffaele and Giulio Romano. The co-existence of two schools so remote in character and spirit, yet geographically so near as Flanders and Italy, shows how little social intercourse could have existed in Europe at that period. Whilst admitting his merits and superiority to others of his school, Lucas van Leyden is described by Fuseli as "ignorant of light and shade in masses," and his forms are condemned as "lank, meagre, and ignoble," and yet this artist "was studying and painting within what is now a day or two's journey from the ensembles of Leonardo da Vinci, M. Angelo and Raffaele."

There are, I trust, few here present who are not aware of the beautiful work preserved in this same strong closet, known as the Commentaries on St. Paul's Gospel, by Marino Grimani, illustrated by the beautiful illuminations of Giulio Clovio. This work, certainly the gem of the collection, presents a curious contrast in its architectural accessories with that to which I have just adverted. The style is strictly Raffaelesque, with medallions and arabesques, such as we see in the Loggia of the Vatican. I cannot pass from this magnificent, and almost priceless, manuscript volume, without advertent to the elegant character of the hand-writing. When we look upon the beautifully uniform, clear, well-proportioned, deliberately-shaped, and, I would almost say, dignified, style of the lettering, and compare it with the calligraphy of the nineteenth century, in which the words look often more like the hasty, unmeaning scratches of a bad pen than the expressions of a man's thought and sense, it must be admitted that the lapse of 300 years has brought, in this respect at all events, no improvement whatever.

Nor, perhaps, can this be wondered at, when we find, as that eminent scholar, Mr. Panizzi, has lately proved, the great Bolognese painter Francia himself, did not think it beneath him to unite the study and practice of typography with the highest efforts of a most gifted pencil.

Descending, now, 100 years, we come to the sketch of Inigo Jones; not the original book, it is true, but an admirable fac-simile of it, presented to Sir John by the late Duke of Devonshire, the owner of Inigo's own handiwork. It is not for me to dwell on this sketch-book, as it consists exclusively of studies of figures and drapery. The book bears date at Rome in 1614, when the great architect was about forty years old. I cannot refrain, here, from adding that the motto which graces the first page of this sketch-book is "Altro diletto et 'Imparar non trovo" (I have no pleasure but in acquiring knowledge), a sentiment which does high honor to Inigo Jones, and one which should never be absent from the mind of an artist, be he young or old. When a man has reached the period at which he imagines that he has learnt his art and needs no more teaching, he may rest assured that he has fallen fully into the snare and yellow leaf.

In an evening devoted to the literary bequest of Sir John Soane, it seems natural that I should not altogether abstain from touching, for, at least, a few minutes, upon that eminent professor's own peculiarities of architectural design. Although within these walls we very wisely abstain from the remotest criticism on the works of contemporary artists, that salutary limitation has long ceased to exempt Sir John's works from the free comment of the critic. Upwards of a quarter of a century has passed away since his death.

I have, however, no inclination nor intention here to use that lash. I would, but remark, generally, that a constant endeavour to seek out picturesque effects, especially in the design of interior architecture, seems to have led to much of that eccentricity of manner which most critics are inclined to condemn in his works, although it may be found to have resulted in some ingenious combinations, and, perhaps, occasionally in some original conceptions.

We are apt to attach too great value to that quality, "the picturesque." The application of the word is somewhat vague. It is a word of no very remote origin, for there exists, I believe, no word of equivalent value in any Classic tongue; and, certainly, there is no trace of any word calculated to convey the idea in the written records of medieval times—a fact which is, perhaps, the more remarkable as the quality which, probably more than any other, characterises medieval art is this same picturesqueness. To the best of my belief, this word was the invention of the writers on art of the period of the Renaissance. Its primary meaning is clear, although its application is, as I have said, vague and indefinite.

Whatever is especially well adapted for representation in a picture is said to be "picturesque." In that sense its special applicability to natural scenery is obvious; but it is also very properly applicable to those objects of art which, either from their form or color, or from the combination of forms or colors, that they may present, are particularly capable of being agreeably represented in a picture. Thus, an old or ruined building is usually more picturesque than a perfect and new one; for there is a hard dryness in straight lines and sharp angles, and a crudeness, and almost harshness, in bright coloring, which cannot, by the exercise of any amount of ingenuity, be made so pleasing to the picture-loving eye as those more undefined lines and blended tints which almost necessarily characterise a ruin.

It is finely said by Byron—

"There is a power
And magic in the ruined battlement,
For which the palace of the present hour
Must yield its pomp and wait till ages are its dower."

And a somewhat similar idea is expressed by another poet—

"Time
Has moulded into beauty many a tower,
Which, when it frowned with all its battlements,
Was only terrible."

There is also a fruitful source of the picturesque in those combinations or compositions of lines of which the result is an ensemble or group of forms pleasing, though we know not why they please. To dwell on the picturesqueness of medieval art would be superfluous, and, indeed, trite, for picturesqueness is, as I have said, the special and appropriate quality of that style of art: the groups of towers and pinnacles, and gables and chimney-shafts, which characterise it, are the very embodiment of the picturesque.

I think it may be more useful to you to point out for your observation how that far simpler and less pretending forms are susceptible of this attractive quality when treated by the hands of an artist. It is impossible to stray over that land of art—Italy—without meeting at every turn with plain farm-buildings, ordinary lodges—nay, sheds and gateways, of high æsthetic interest. Not that they have been purposely so designed to please, but the old Italian mind seems to have been so thoroughly imbued with artistic feeling, that they could not help imparting it to every common object they touched. Vague and difficult of precise definition as this word "picturesque" is in the painter's art, when applied to architecture it is certainly still more vague. We may readily enough say that monotony, uniformity, and severity of outline are opposed to the picturesque, and that freedom and absence from restraint and variety of outline are circumstances favorable to, and consonant with, the picturesque. Yet to say that these latter circumstances are essential to its existence, or that the former are unreservedly incompatible with it, would be going a great deal too far.

Can we, for example, venture to say that the Doric temple of Minerva at Athens is not picturesque? Yet symmetry and severity of outline are its special characteristics.

So in an ordinary modern London street we may find entire absence from restraint, and a superabundant variety of outline, for every man builds as he likes, and so variety is carried even to excess, yet no one will quote Oxford-street or Fleet-street, on that account as furnishing examples of picturesque architecture. In truth, I apprehend that this very favorite but somewhat unintelligible word must be classed with the adjectives, grand, beautiful, and such like; words which address themselves rather to the feelings than to the judgment. Hence it arises that, in architecture, picturesqueness is a very dangerous object of ambition, for if it be sought for by those who cannot feel it, there would be imminent risk of their running into ridiculous conceits.

Their abortive attempts at the picturesque seem to have the same relation to really and truly picturesque compositions that nonsense verses bear to real poetry. Each may present the requisite combination of long and short syllables, and the legitimate number of them; but the one is empty and unmeaning, whilst the other may, perchance, be fraught with sense and genius.

Even among men who may really have some true feeling for the picturesque, there are those to be found who have a sort of maudlin love of it, leading them to an extravagant and morbid craving for it; to such an extent, I believe, as sometimes to affect even the religious faith of those who abandon themselves to it. There are those who can scarcely say their prayers with warmth and sincerity, unless assisted by such helps to devotion as the architect or decorator may be able to afford; "the dim religious light," the "storied window richly light," and the hierarchy of gilt and painted sails.

It may be uncharitable to doubt the reality of feeling of such devotees, and we are here all of us too well acquainted with, and too much alive to, the influence of the fine arts upon the mind and heart of men, to doubt their power of fostering a genuine religious sentiment; such an influence is, indeed, one of their most legitimate and salutary effects.

But every virtue has its sham: there is the courage which needs a dram to call it into existence; there is the charity which owes its birth to ostentation; and there is, as I have already intimated, the religious sentiment, which needs these external melodramatic appliances to stimulate it into active existence; its votaries need a picturesque architecture, and even a picturesque costume, for their sustenance, otherwise there is reason to fear that their pious zeal might wane and wax faint.

These, however, are but examples of a false and counterfeit feeling. Men's minds are curiously and variously affected. There are some more deeply affected by contemplating the lowly, unambitious village church, wholly wanting the attractions of sculptured art, than by gazing up at those vast petrifications of religion which have awed so many generations of worshippers.

Still, I repeat it, there is no denying the wide prevalence of that influence which architecture exercises, be it evidence of human frailty or of the potency of art; and it seems a very legitimate exercise of the witchery of art to practise those cunning devices by which she can be made to elevate the mind or touch the imagination. It is in truth the special province of the fine arts to do so.

The kindred arts of poetry, of music, and of painting, have in all ages asserted their dominion over the mind of man, and have claimed to bring even his enlightened intellect within the sphere of their potent spells; surely then, architecture neither abdicates its proper functions, nor forfeits its character for utility when it aims at exercising over the mind the like mysterious influence.

But if it be true that such power belongs to our art, it behoves all who practise it to regard that power as a sacred trust, and not to risk its character by exercising its influences improperly.

After all, I believe that the most legitimate and the most wholesome exercise of the power of art is that which is inspired by truthfulness of character.

I do not mean that the brewhouse or the laundry, when unavailably forming part of the landscape, may not most legitimately have their homely domestic uses veiled under some more pleasing forms than those afforded by the undisguised smoke-fue or the ventilator; but in buildings demanding architectural character I am confident in the opinion that by giving to each the expression that most befits it, we secure for it at least the one great merit of truthfulness of character. The tale that is most truthfully told is usually that which most affects us; and although it is not to be desired that the conventional forms and structural necessities, which an architect has always so largely to contend with, render it vain and futile to attempt to give a building all the expression of which the painter's or the sculptor's work is susceptible, yet our art would little merit the position which it is admitted by all to hold as a fine art were it unable to affect the imagination, and, to a certain extent, the passions. It is, I apprehend, more than a mere figure of speech to say that a building frowns on us or smiles on us, or that it appears to attract or repel us. There is in one building a majesty that subdues us, in another a levity that even amuses us. There are some buildings of so festive a character that in their very aspect they appear to sympathise with us in our joy, whilst others, on the contrary, are of an aspect congenial with an opposite tone of mind.

These are the qualities which constitute character in architecture, and, therefore, as I have said before, so do I repeat now, the character of his work should ever be one of the chief studies of an architect. But I perceive that Sir John's aspirations after the picturesque have led me into too long a digression.

There are other peculiarities in his works on which I need not especially dwell, far whatever may have been his faults, they have not been imitated by others, and have not, therefore, influenced his successors either for good or evil. There were so many of these peculiarities or eccentricities in his manner of designing, that I am inclined to believe that he was ambitious to found a style of his own. Without, perhaps, venturing to go so far as to condemn altogether any such attempt, I would, at all events, say that to found an original style of design in architecture would be a task demanding a very high rank of genius, and it is an enterprise which I certainly counsel no man to undertake.

I believe it was some vague and weak ambition of this nature which led Mr. Dance to conceive and execute so unfortunate a design as the front of the Guildhall of London; there is a tradition that such was his aim. He sought to produce a kind of cross between Gothic and Classic art, and the result was certainly not such as to tempt imitation or to enhance his fame.

I am convinced that no novel manner of designing which has deserved to be dignified with the designation of a style was ever the production of any one artist. It has ever been from the force of circumstances that styles, in one art at least, have gradually taken their rise. I need scarcely point out to you how greatly collateral circumstances, and accidental or local peculiarities, have, at all times, and in all countries, influenced the changes of style that have taken place in architecture. Of this, however, I took occasion in a former lecture to point out to you various notable instances, and many others might readily be adduced.

One of the ablest, as well as one of the most recent writers on the subject of the so-called Gothic architecture, M. Viollet le Duc, points to the use of small-sized stones as one of the special characteristics of that style, and nearly 200 years previously our own Sir Christopher Wren had made exactly the same observation. Both these writers point out how materially the style was modified and influenced by that practice. In the middle ages there were few good roads, and this rendered the cost of the transport of stone proportionately high; a cost still more seriously augmented by the inordinate tolls, private and public, then so often and so extensively, on some pretence or other, levied by the land-owners, whether lay or ecclesiastical, through whose demesnes or territorial limits the stones had to be conveyed to their destination. These causes of expense operated to so great an extent as to render the materials used in a building usually much more expensive than the labor required in working and setting them. Moreover, the want of regular employment for men in those times, and the consequent low scale of wages, rendered labor a comparatively unimportant part of the cost of a building. From hence a state of things arose exactly the converse of that which exists at present, when the mason is often better paid than the clergyman, and when canals, railroads, and machinery have reduced the cost of getting and carrying heavy building materials to a small fraction only of that which prevailed in medieval times. That former state of things naturally led to, perhaps, nearly all the peculiarities of the prevalent style of building. There was a lavish expenditure of labor in deep undercuttings and perforations, and the intricacies of every kind which, above all things, distinguish Gothic work, and which are, in truth, essential to the full and complete development of it. At the same time, the cost and difficulties of the transit of freestone naturally caused the use of it in small blocks, as observed by Wren and Viollet le Duc—a result which, of course, tended to encourage those very intricacies and delicacies which characterise Gothic carved work in general. Each boss and badge and crocket was usually a distinct stone; the capitals of the very largest pillars and piers were built up in courses of very moderate depth, each course of stone composing a distinct and independent band or tier of foliage or other ornamentation; whilst the shafts of columns, even in the largest structures, were, for the reasons I have adduced, usually of diameters measuring but a few inches.

In making these remarks I am very anxious not to be mistaken as making them with any view, in the slightest degree, to the disparagement of any special style. My aim is to show that, as the manner of building has always greatly depended on the particular circumstances of the time or the place, and as every phase of art has varied with the variation of circumstances, it seems as useless as, I think, it would be irrational to expect, to bring back architecture identically to any one past phase of the art, unless we can resuscitate and bring about again all the concomitant circumstances to whose influences that phase was due, and restore to it its special character—a resuscitation which, I think,

we may regard as of necessity impossible. At all past periods of our art every style has, in short, been the type of its own age, the result of that particular period which gave birth to it. The Byzantine style, for example, was the result of the grafting of an Oriental element on the Classic stock at a particular period of its existence. Had Byzantium succumbed to the West at an earlier stage of Classic art, the resultant style would probably have assumed a very different aspect.

Again, had not Peter the Hermit preached the Crusades at the particular period when a great æsthetic energy was developing itself in some parts of Europe, the aspect ultimately assumed by mediæval architecture might, perhaps, have been very different from that which in fact prevailed.

It is the stage of civilisation which a people may have reached, and the condition they may happen to be in, that determines the effect upon the arts of any great historical event.

To expect, therefore, to receive successfully in its integrity any style of art under circumstances wholly different from those which gave birth to that style, would be to entertain an expectation inconsistent with the experience of all past time.

We may very easily repeat, to any extent, the examples of any period we may fancy, but such repetitions, although it is occasionally—indeed, far too often—the fate of an architect to be called upon to produce them, are mere travesties, artistic whims, so to speak, the result for which on the part of the public taste, is by no means indicative of a well-founded or sincere love of art, but suggestive, rather, of the caprices of an uninformed, puerile taste which takes up or tosses away a style, as a child would its toys, just as the fancy of the moment or the caprices of fashion may dictate.

I have thought it well to say so much even at the risk of being reminded, perchance, that I am but repeating what I may already in another form, and on some former occasion, have ventured to say.

I am anxious to urge upon you, with all the emphasis I can command, that the modern tendency to repeat and perpetuate old forms, and thus to live, as it were, upon the wits of our predecessors, or, I might say, to feed upon the *réchauffés* of the past, is a mischievous tendency, when carried to excess, destructive of progress, and leading inevitably to debasement. I would not, then, have you to look with indiscriminating reverence on the architectural productions of past times; let those productions be ever judged with reference to their age and to the contingent circumstances of their existence.

In many respects the present age with justice may lay claim to the merit of having advanced as time has advanced. It has with truth been said that such has been the moral advancement of education and intelligence, that a poor child in a Sunday-school is in some respects better informed than the sages and philosophers of antiquity, and certainly much of what was called science by our forefathers has proved to be but foolishness. Nevertheless, we must admit that no such progress appears to be independent of those circumstances on which excellence of most other kinds depends, and to follow some different law. On a former evening I adverted to the apparent anomaly that in the twelfth century at a time when all Christendom was wrapped in the grossest state of moral and social tyranny, at that very period there existed in France a school of art which was then commencing to produce works which may, at the present day, be regarded as equal to those of the best days of antiquity.

Again, sculptors, as well as architects, are now, in the nineteenth century, endeavouring to rediscover the oldest principles of art, and to emulate, although *longo intervallo*, the works of artists who lived twenty-four centuries ago. We may seek illustration, too, in still another quarter. In Arabia a faith sprung up in the seventh century which deluged Europe with blood and tended to inculcate a gross sensual system—a faith which has raised the most formidable barriers against the moral improvement and civilisation of mankind; yet it was to the followers of that very faith of Mahomet that we owe some of the most graceful works that architecture has yet produced, as well as one of the most beautiful styles of ornamentation that human taste or ingenuity has yet devised. In short, we get bewildered in a labyrinth of contraries when we seek to assign the sources from whence has arisen that perception of beauty which constitutes fine taste.

However charmed, therefore, we may be by these manifestations of genius which past times afford us, our reverence for them need not be indiscriminate. We should endeavour to search out what is beautiful and worthy of our admiration and study, uninfluenced, as far as our weak nature will permit, by local, national, or sectarian prejudices.

It is from the high vantage ground of modern civilisation that we should pass in review before us the works of all preceding time, and of every creed and clime; not, however, by any means with a feeling of self-satisfaction or assumed superiority (for he must be, indeed, in a hopeless state who is not fully sensible of the inferiority of the present to the past in very many respects—so far, at least, as art is concerned); but rather let a due reverence for the works of past times be mingled with a sense of gratitude that so rich a storehouse of experience has been laid up by them for our use and benefit; and let us demonstrate our thankfulness by devoting all our energies, not to a dry, antiquarian, pedantic imitation, but to a painstaking endeavour to improve ourselves by searching out and studying those principles which may appear to have led artists of past times to so great excellence. Principles, remember, never change. To adopt, in conclusion, the language of a former eminent President of this Academy—language which, applied as it was to his own particular branch of art, seems, nevertheless, equally applicable to all art—"There may," he says, "be new combinations, new excellencies, new paths, new powers, but there can be no new principles in art."

It is to the exact understanding of these, therefore, that our best energies should be directed.

YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual meeting of this members of the Society was held last week in the rooms, Minster-yard, York, when the Rev. T. BAYLY read the minutes of the proceedings for the past month and the annual report, which referred to the improved position and prospects of the Society, and to the objects of interest visited at the last autumnal excursion. On the adoption of the report, the Rev. T. BAYLY drew attention to the dilapidated state of the spire of All Saints' Church, North-street, York. The spire had been patched up and plastered, and was thought by some to be safe; but, nevertheless, the actual state of the spire was not the less dangerous. The spire of St. Mary's Church, Castlegate, he feared, was also dilapidated. He thought it would be desirable if something could be done, so that these spires, the only examples in the city, might be restored, or, at all events, that of North-street Church rendered safe.

Mr. G. F. JONES stated that the base on which the spire rested had decayed, and the spire itself was not safe. Instead of being taken down and rebuilt, it had been plastered over with cement. The spire was unsafe, although it might stand for a long time. In answer to a question, he said that it was possible to strengthen the spire.

Mr. J. C. SWALLOW suggested that as the Society had a balance in hand they might consent to give a small grant from their funds towards the restoration or rebuilding of this spire, and by this means a subscription might be raised to carry out the work.

The Rev. T. BAYLY remarked that it was the conviction of the late treasurer that the entrance fee of 10s. prevented many persons from joining the Society who would otherwise do so. In that opinion he concurred, and he, therefore, moved that the fee be abolished. After a brief conversation, the motion was agreed to unanimously.

CONSTANTINOPLE.—The magnificent mausoleum of Sultan Mahmond, is to be redecorated, by order of the present Sultan, and, when completed, will form one of the most attractive ornaments of the Turkish capital. The sarcophagus is to be surrounded by a silver railing, on which inscriptions, in letters of gold, will set forth the praises of the reformer. Several candelabra, in massive gold, are to be placed inside, and to the costly carpets which already adorn the tomb are to be added different tissues, masterpieces of Indian and Persian art.

ON THE ESSENTIALS OF A HEALTHY DWELLING.*

WHILST such are the results of the experience of the two leading metropolitan societies in regard to old buildings—and, as far as my information goes, it accords with that of some other societies—I am glad to notice instances of individual effort which have had complete success, doubtless arising in the main from the sound judgment and more careful management brought into exercise in the cases referred to.

In the parish of Chelsea, our honorary member, the Rev. Richard Burgess, and some friends, established, in 1851, two of the earliest renovated houses for families, which have proved an admirable example for those disposed to promote this object in a quiet and unpretending way. The houses are always filled with good tenants, on whom the most favorable results have been produced, and from the net receipts, after the payment of 5 per cent. interest on the outlay, which was £300, that amount was entirely paid off at the end of 8 years, and, since then, there has been a clear profit of between £30 and £40 per annum.

To give another example in London: a few months since I went over a considerable property in the city, part of which, in a central locality, comprises dwellings for 86 families of the working class, and, in another, three entire houses. The owner is a private gentleman, who derives from this house property his chief income. On coming into its possession he felt the responsibility of ownership, and desired to put it into a condition fit for the occupation of well-conducted tenants. I can testify to his entire success in that respect, and also to the contrast with the neighbouring property which his presents. All that he was anxious to do has been accomplished without pecuniary loss. His rent-book, kept with much exactitude, showed the greatest regularity of payment, and this he told me compensated for extra expenditures on various objects beneficial to the tenants. The following results of the experience gained in this instance may be useful. Of the gross amount received for rent, about one-fourth covers the taxes and general repairs, or one-third covers the whole of the landlord's expenditure, including the collection, contribution to schools, &c. A great secret of success has been the forbidding the practice of underletting as a rule, though occasionally a lodger is allowed. Another custom tending thereto is that of the owner going over the property himself quarterly. With much consideration and justice to the proprietor, one part of this property was, on a recent application made to Parliament by a railway company for power to take it, treated as an exceptional case, and allowed to remain as an instructive lesson to neighbouring owners: amongst others, the railway company which coveted its possession.

The success which has—doubtless, in the main, owing to careful management—attended the Society at Hastings, renders it worthy of special notice. It was established about five years since, and has now a paid-up capital of £18,000, of which £14,000 has been expended in purchasing the freehold and putting into good condition about 130 old cottages and two lodging-houses. An annual dividend of 6 per cent. has been paid to the subscribers, besides laying by 1 per cent. per annum as a reserve fund. A benevolent fund is formed among the tenants, and two visitors inspect the property every fortnight.

Three examples referred to in succession, after the two metropolitan societies, are instances in which old buildings have been exclusively operated upon. I shall now briefly allude to some instances in which societies have constructed new buildings, with more or less pecuniary success; and as there have been, since 1850, from 25 to 30 such societies established in various provincial towns in England, besides those in London, you will not expect me even to name them all.

The Strand Building Company, on their houses for 25 families, in Eagle-court, has paid a dividend of 4½ per cent.

The Windsor Royal Society, which was established in 1852, under the special patronage of her Majesty and the late Prince Consort, has now £9,000 invested in new cottages and in two lodging-houses, the net returns from which, owing to temporary circumstances, have lately yielded 4 per cent. to the shareholders, instead of 4½ or 5 per cent., which they would otherwise do.

The Redhill and Reigate Cottage Improvement Society, in a late report, stated that, from the eagerness with which their first built cottages were taken, they have been induced to add twelve more to the nineteen with which their operation commenced. The contract for the second series was at the rate of £120 7s. 1d. per cottage. A dividend of 5 per cent. has been paid to the shareholders, and £55 16s. 3d. added to the reserve fund, with every prospect, apparently, of the same dividend being continued. These cottages are very near to the railway station, and have a neat appearance; they resemble much some of those built by the Windsor Royal Society.

Amongst the efforts which may be classed with those of associations are the model lodging-houses built by the Huddersfield Improvement Commissioners, in pursuance of powers granted by their Acts of Parliament; and this, I have been informed, is the only instance in which municipal authorities have erected such buildings at the public cost, and out of improvement rates. Provision, in this instance, is made for the accommodation of 221 men, 34 single females, and 12 married couples.

In 1855 the Corporation of the city of London contemplated the construction of several large piles of buildings for the occupation of such of the working classes as were ejected from their dwellings in the construction of new streets; but they have done nothing.

It is not necessary for me to notice at length what has been done in Scotland, where, however, exertion, both in the towns and in the country, is quite as much needed as it is in the south. The lack of municipal supervision in Edinburgh was proved very recently by a melancholy catastrophe, which issued in the death of 35 human beings, and brought prominently into view the way in which the poorer population are huddled together in gigantic buildings of seven and eight stories, divided into dwellings of one and two rooms each.

In a paper which I read at the Glasgow meeting of the National Association for the Promotion of Social Science, and which is published in the Transactions of the Association for 1860, a somewhat detailed account is given of numerous blocks of improved or model dwellings which have been constructed in Edinburgh since 1850. In several of these, but very recently finished, the external gallery (supported by cantilevers) and open staircase system has been adopted, and in other instances, where there is only one upper story, the dwellings in that part—for all are arranged in flats—have their approach on the opposite side of the building to that on which the ground floor is entered, and the access to each dwelling is through its own garden. The Pilrig model buildings, near Leith-walk, is an example of this arrangement; there are 44 houses, the cost of which, including drains, was £32 per house, and they pay to the shareholders a dividend of 5 per cent., exclusive of additions to a sinking fund. A spirited association of gentlemen in Glasgow has lately had it in contemplation to expend £20,000 in cutting a new street through the Winds, and improving right and left that wretched property.

The measures for improving the dwellings of the laboring classes, which have, from benevolent motives, been taken by associations on the Continent, and in the North American States, are so distinctly traceable to our own in England, that it would not be right to pass them entirely over in silence.

I have noticed already those adopted at Mulhouse, in Franco, and have alluded incidentally to some others. All that was done in Paris, to the summer of 1855, I have seen, and having conversed on the subject with those most competent to form a correct opinion, feel warranted in saying that the good intentions of the Emperor, in appropriating 10,000,000*fr.* to the encouragement of this object, in the form of a subvention of one-third the outlay, have not, excepting in a few instances, been seconded. Most of those who engaged to any extent in the enterprise appear to have done so exclusively as a commercial speculation, expecting to derive a considerable pecuniary profit, and uninfluenced by benevolent motives. In addition to this unfavorable feature, the leading French societies had a similar misfortune to that which befel one of the earliest established societies in London, through the

* Concluded from page 89.

† The plans given by me for twenty of these cottages have been published by the Laborers' Friend Society, and will be found in the last edition of my Essay on the "Dwellings of the Laboring Classes," fifth thousand.

‡ A copy of this paper is in the library of the Institute, as well as another, on "The Improvement of the Dwellings of the Laboring Classes," read by the author, at the meeting of the same Association, held in Liverpool in 1858.

§ Those who desire to know something of the actual condition of the working-classes in France, will do well to consult a recent work, "L'ouvrière, par Jules Simon."

dishonesty of the then secretary, causing in both instances a very serious discouragement to the work. It is necessary to refer to these adverse occurrences, as they alone will account, in a great measure, for the sudden check which this movement had in both capitals between five and six years since.

Turning to a brighter feature of the case, I mention with pleasure, that when passing through Paris last autumn, it was stated to me, on reliable authority, that a very considerable number of suitably arranged dwellings have been recently built in different directions by private enterprise, and with a return of full 8 per cent. on the outlay. Thus, as in our own experience, private enterprise has proved more successful in a pecuniary point of view than similar work undertaken by societies.

The first society on the Continent to follow the example given in England, is stated by Dr. Huber, who was for some years its secretary, to have been that at Berlin, formed under the patronage of his Majesty the King, to whose enlightened and personal interest in the work I can testify, having on two occasions had the honor of conversing with his Majesty on this subject. At a late meeting of this society, over which his Royal Highness the Prince Frederick William presided, it appeared that the capital embarked is about £34,655, and that there are dwellings for about 219 families and 31 work-shops; the number of occupants being 1,168. The shareholders receive a dividend of 4 per cent. and the available addition to the reserved fund was in one year about £1,195, one half of which was, however, repaid to the tenants. At the same time the annual meeting was held of a kindred, but smaller, society, called the "Alexandra Stiftung," by desire of the Emperor Nicholas of Russia, who, at its formation in 1852, gave 1,000 ducats to the funds. They amounted, in 1858, to about £21,358, partly arising out of donations and partly from loans at 4 per cent.

With an express view to the construction of suitable dwellings for the working classes in St. Petersburg, where they are greatly needed, an architect was deputed to visit London about three years since, and a large number of such houses have been built by a company formed for that purpose.

At Frankfurt, a society formed on a strictly commercial principle, to supply a want greatly felt in that city, is now in successful operation, under the guidance of its energetic and philanthropic promoter Dr. Vancuttrapp, who visited England eighteen months ago to obtain information on the subject.

More recently, a gentleman from Bremen has been to me for advice in regard to the carrying out of an extensive undertaking, which contemplates the building a very large number of workmen's houses on church property, without the city. The remarkably favorable terms required for the ground, and the unusually low rate of interest sought for by the projectors, prove the earnestness of all engaged in this good cause, and how really anxious they are to meet the necessities of a case, which is here seen to be, as it is in reality everywhere else, most intimately connected with the well being of the masses of the population. The study of this example might be profitable to some in our own country.

The usual rate of interest which is sought from such undertakings on the Continent appears to be 4 per cent., with a small sinking fund for paying off the capital. In some few instances it is 5 per cent., and the opportunity is frequently afforded the tenants of becoming the owners of their own dwellings, by a gradual payment, in addition to the rent—a system which renders the dwelling a saving bank, and has been found greatly to stimulate habits of forethought and sobriety.

Much time would be occupied were I to enter on any detailed account of what has been done for this object in other countries besides those which have been named already. The movement has extended to Sweden, to Amsterdam, and to other towns in Holland; to Belgium,* where enlightened views on the subject have been advocated in two International Congresses, held under the patronage of the King and the royal Princes. In Bavaria, and in several of the minor German states; in many parts of Switzerland, and in Italy, where one of the earliest and most suitably arranged piles of model dwellings is that at Florence, which accommodates 100 families. How greatly sanitary improvements have long been needed in most parts of Italy, many of my auditors can testify, whose first recollections of Rome and Naples are of a more recent date than mine, which go back to 1828-29. When I was at Genoa in 1856, its chief magistrate told me that the municipality had there been put to an expense of £500,000 sterling during the recent attack of cholera, mainly in relieving those of the population who live in narrow streets and filthy dwellings; and he added, "I can now, from experience, confirm what is stated in the publications you formerly gave me, as to the heavy expense which may be incurred in consequence of a defective sanitary state." It is rejoicing to know that Naples is in this respect greatly benefited by its emancipation from a rule so jealous of the semblance of foreign interference, that our ambassador cautioned me against the attempt to diffuse any of that light which even Cardinal Antonelli had spoken of as being especially needed at Naples.

A periodical which has a wide circulation in the North American States, published much of the paper I read before the Institute in 1850, together with plans of the Streatham-street model houses for families; and since then, partly, no doubt, owing to the great interest taken in this object by the late Mr. Abbott Lawrence, American Minister in London during the Great Exhibition, piles of well-arranged model dwellings for families, five stories high, have been constructed in New York and in Boston. In the former city the return on the capital invested is 4 per cent., and in the latter, 6 per cent., with reference to which it is stated that "the effect of proving that houses for the poor can be built on the best plan for the health and comfort of their inmates, and, at the same time, be good investments of property, is manifest in many private undertakings. Several large houses have been already built on similar plans; old lodging-houses have been in many instances remodelled and otherwise improved."

The measures which have been adopted by individuals, with a view to aid in helping themselves those who need such aid, remain to be noticed. Our most gracious Sovereign has honored by her royal patronage two societies established for this object, and has given substantial proofs of interest in their success; whilst the laborers' dwellings belonging to her Majesty abundantly manifest a kind and thoughtful regard for the welfare of their occupants. These are but some amongst many other illustrative facts which might be added to show that the feelings of the lamented Prince Consort on this subject "are," in the words already quoted, "entirely and warmly shared by her Majesty the Queen."

Much has been done towards a fulfilment of the desire so happily expressed by an ancestor of our gracious Sovereign, "That a Bible should be placed in the dwellings of all his subjects," and we rejoice at it; but who that knows the actual state of vast numbers of those dwellings can be unaware of the obstacles they present to the profitable reading of that book, and to the embodiment of its holy precepts in the daily life of their occupants?

I have briefly stated some of the efforts made of late for the removal of obstacles which impede alike the physical, the moral, and the religious improvement of the masses of the people, and have endeavored to point out the practical means which are calculated, through their extensive adoption, to extend more widely the benefits of a healthy dwelling to our laboring population.

It is my conviction that the feeling of a weighty responsibility, which rests, much more extensively on the upper and middle classes in regard to this matter than is generally admitted, needs to be pressed home and brought into more active operation than it has hitherto been.

With this view I desire to urge on all the example of that truly great and excellent Prince, whose irreparable loss must be long and deeply felt in every branch of effort connected with the objects of social science. And it is with the earnest hope of encouraging and stimulating many to follow in a path which has been trodden by one so illustrious, that I bring before you some of the many and wide-spread results traceable to a single manifestation of the great interest felt by his late Royal Highness in the subject under consideration.

The Commissioners for the Exhibition of 1851 having replied to an urgent application made for a site, "that a model lodging-house does not come within the design of the Exhibition," a memorial on the subject was presented to his late Royal Highness, who immediately expressed the most lively interest in the project, and a desire that the contemplated model houses should be constructed on his own account, which was done, under my direction as honorary architect. With much personal trouble to the Prince, the requisite official consents of four Government departments were obtained, for placing the

houses in the Cavalry Barrack yard, opposite to the Exhibition. An objection to this was made by the Commander-in-Chief the Duke of Wellington, lest they should give rise to a feeling of dissatisfaction in the army with the want of any accommodation for married soldiers; an evil which his Grace apprehended the country to be then unprepared to remedy. I notice this fact in order to show how clearly their effects were foreseen by the great Duke, and how speedily good results arose out of their construction. Within twelve months after the Exhibition, a large and well-arranged lodging-house for married soldiers was commenced near the Vauxhall-bridge-road, by an association of officers of the Battalion of Guards.

The benefits resulting from this first essay soon led the Minister of War to commence building separate dwellings for the married non-commissioned officers and men at the Chatham Garrison; and a grant of £30,000 has been recently made by Parliament for carrying out the same object elsewhere, at the instigation of that great friend to the soldier and I may add also, to the laborer, the lamented Lord Herbert. In a note, dated as recently as April last, that distinguished example of sacrifice to self-denying duty expressed to me his "hope of seeing a great change in the next few years in the dwellings of the rural population." I mention this as an additional call to zealous effort in the good work, for "the night cometh wherein no man can work."

Amongst the number of visitors to these model houses, amounting to upwards of 250,000, many gave evidence of their having duly appreciated the object for which they were placed in the Exhibition, viz., the conveying practical information, calculated to promote the much needed improvement of the dwellings of the working classes, and also of stimulating those whose position and circumstances enable them to carry out similar undertakings, and thus, without pecuniary sacrifice, permanently to benefit those who are greatly dependent on others for their home and family comforts. The building was adapted for the occupation of four families of the class of manufacturing and mechanical operatives who usually reside in towns, or in their immediate vicinity,—those, in fact, by whose labor the larger portion of the objects in the Exhibition had been produced. The open staircase and gallery, giving access to the upper-floor tenements, were prominent features in the arrangement of these dwellings, and their subsequent adoption in buildings constructed for working people in towns has come under my notice in Edinburgh, at Liverpool, Ramsgate, Brighton, Windsor, and other places, as well as in London and on the Continent. The example which may, perhaps, be pointed to in London as bearing the closest resemblance to the original structure, and as fully answering in a pecuniary point of view, is at Shadwell, close to the line of the Blackwall Railway, where a number of miserable dwellings, tenanted by the lowest class of persons, came by inheritance into the possession of a private gentleman, W. E. Hilliard, Esq., of Gray's Inn. Actuated by the most philanthropic views, he decided on endeavouring to improve, not only his own property, but also by example the immediate neighbourhood; and his efforts have been crowned with signal success. The old dwellings have been replaced by an entire street of considerable length; on both sides of which houses for accommodating in the whole 112 families have been built, on the general plan of the Prince Consort's Exhibition model houses, with an open staircase, giving access to each pair of upper-floor tenements. The twenty-eight blocks of four houses cost £187 each; and, after allowing for ground-rent and all charges, I can state, on the authority of the owner, that "they continue to pay upwards of 6, in fact nearly 7 per cent. as a net return on the investment; and what," he adds, "is, perhaps, of more consequence, they are almost constantly let, and are appreciated by the tenants, who, as a rule, are pretty stationary, and not migratory, as that class frequently are."

Scarcely any foreigners who visited the Exhibition of 1851 returned without examining the Prince's model houses, and but few left without carrying back to their several countries some of the publications bearing on the improvement of the dwellings of the laboring classes, which were there abundantly distributed. My own opportunities of judging of the effect of this little structure enable me to say that it gave to the movement an impulse such as it has not received from any other single effort, and the results of which have spread far and wide. The descriptive account of the building was translated into German and published at Berlin, much of it also appeared in French.

The collection of sanitary and other appliances adapted to the circumstances of the working classes, which occupied part of the cottages, was the first public exhibition of the kind, and which I had hoped to see continued and increased, when, at the close of the Exhibition, the building was removed to Kensington-park, under the charge of the Office of the Woods and Forests; a proposal with that view having been made to the Chief Commissioner, Lord Seymour. The practical value of such a collection was recognised at the Congrès Général d'Hygiène, held in Brussels in 1852, where, on my proposal, "the utility of establishing in each country, and also in the principal centres of the population, a collection as complete as possible—a kind of museum where shall be gathered together models, plans, specimens of materials, &c., relating to hygienic amelioration and progress," was unanimously declared.

The Economical Museum, formed by my worthy friend Mr. Twining, at Twickenham, is an expansion of the same idea.

Amongst the other numerous instances of individual effort which might be given, I shall only notice—

1st. The building in Lambeth, on the property of his Royal Highness the Prince of Wales, as Duke of Lancaster—a range of model dwellings for families, with shops on the ground floor, at a cost of £16,000. The close proximity of extensive gas works has, I regret to say, impeded that full occupation which is almost invariable in such buildings elsewhere.

2nd. The establishment, by Lord Kinnaird, in Peter-street, Westminster, of some of the earliest renovated model lodging-houses, and his promotion of similar houses in Dundee. In the latter case, the original outlay, as well as the interest thereon, has mostly been paid out of the profits. Although the beneficial operation of the Lodging-house Act has tended to diminish, in some measure, the great necessity for such houses, the adoption of a suggestion made to me by Lord Kinnaird, would doubtless prove of great service to those of the working-classes who migrate in search of employment. It is, that "every town ought to have a model lodging-house, with notice thereof stuck up at the different railway stations."

3rd. Miss Burdett Coutts has contributed in various ways to the object under consideration, the most important of which is the building, under the direction of Mr. H. A. Darbisher, a considerable range of dwellings for working people in Bethnal-green, one of the poorest parts of the metropolis. In the upper part of this structure, which is four stories high, a covered area for exercise, and a play place for children, as well as a laundry, are provided.

4th. The five piles of family dwellings,† built by Mr. John Newson, in different parts of the metropolis, although susceptible of improvement in some of their details, deserve to be mentioned, on account of the striking contrast which they present to the dwellings generally occupied by the working classes in London. They accommodate 125 families, and have cost £13,200. The annual gross receipts are £1,500, the ground-rent, taxes, current expenses, and repairs average £830, which leaves a net return of about 5½ per cent. on the outlay. All these buildings are arranged with open galleries, resembling, in that respect, the Streatham-street and the Prince's Exhibition model-houses, which renders them exempt from house duty, each tenement so approached having been pronounced by the Judges to be a separate house in regard to taxation. One important recommendation of this system, besides that of its healthful tendency, from the free circulation of air, and the distinctness of the tenements.

The scope of my paper will only admit a passing remark with reference to Benefit Building Societies,‡ of which Mr. Tidd Pratt stated recently that there exist 2,000 with a paid up capital of £8,000,000. A machinery so extensive, and having such resources, might, if well directed, accomplish much for the object under consideration; but it is to be feared

* This point was justly held by H.R.H. to be of primary importance to the adequate extension of the work. The detailed estimated cost of the model block of four houses was £458 2s. 6d.

† Two of them are in Grosvenor-mews, near Berkeley-square, one in Bull Head-court, King-street, Snow-hill, and another is the Bull Inn-chambers, Holborn-hill.

‡ Those who may desire information as to the working of some of these societies, will find an account of the origin and progress of four such associations in Yorkshire, given in a paper read by Mr. J. A. Bains at the Bradford meeting for Social Science, and published in the Transactions of the National Association for 1859.

* The Belgian Government has published an instructive series of resolutions on the construction of dwellings, which was drawn up and adopted at the meeting of the Congrès Général d'Hygiène, held in Brussels in 1852.

that many of the houses built in connexion with these societies are inconsistent with a healthy and convenient dwelling. This evil, which has been pointed out to me by the late eminent Dr. Southwood Smith, and other sanitary reformers, would probably be most effectually remedied by the circulation of sound views on the subject, through the medium of Mechanics' Institutions and kindred associations. Here is a fruitful field for individual effort, in the cultivation of which much assistance might be derived from the exhibition of suitable plans for the dwellings of working people, as well as from small collections of domestic appliances conducive to health and comfort.

The nucleus of such a collection was formed under my direction at the office of the Laborer's Friend Society more than twelve years since, and the idea was carried out, as already noticed, on a very small scale in the Prince's Exhibition Model Houses, 1851, as well as in the compartment belonging to the Laborer's Friend Society in the Exhibition itself.

Experience having shown me the great necessity for a general diffusion of sanitary knowledge, I was led to follow up the declarative resolution, in regard to the establishment of illustrative museums, already referred to, as having been adopted at the Congrès d'Hygiène in 1852, by proposing at the Congrès International de l'Enseignement, held in Brussels in 1856, the following resolution: "The Congress declares that it is of public utility that the working classes be enlightened by all possible means in regard to the improvement and keeping of their houses in good order. It declares that the instruction of the young in the laboring classes ought to comprise all which relates to the benefits resulting from good ventilation, and the evils resulting from bad air. Lastly, it thinks that the study of the science of preserving health is one which ought to be rendered accessible to all." The unanimous adoption of this resolution by the representatives of upwards of 20 different countries, recognised the wide-spread extent of the ignorance referred to, as well as the serious nature of the evils resulting therefrom.

Amongst individual efforts for promoting the object under consideration, the prominence given to it as an object of vital importance, in public addresses by many distinguished statesmen, ought not to be forgotten; those of Lord Palmerston have justly carried with them all the weight and high official influence of Prime Minister.

Within the last five years many Ladies have directed their zealous efforts to objects which tend in various ways to domestic improvement. The Ladies' Sanitary Association, the Female Domestic Mission, connected with Bible colportage, and Meetings for the Instruction of Mothers, exercise a highly beneficial influence in this respect.

Notwithstanding, however, all our recent ameliorations, it is a well-ascertained fact that tens of thousands of human lives are sacrificed annually in Great Britain through ignorance and the culpable neglect of means within our own power. But, owing to the noiseless and almost imperceptible way in which such multitudes are carried off by preventable diseases and their homes desolated, we witness no manifestation of the practical sympathy so justly shown by the public, when, through some lamentable accident, a score, or perhaps hundreds, are suddenly deprived of life, and their families of the means of subsistence.

When recommending sanitary ameliorations to influential persons on the Continent, the misery and degradation in which vast masses of our fellow subjects are sunk, owing, in a great measure, to their domesticity state, has been so often pointed at as a reproach to England, that the words "Physician, heal thyself" have frequently occurred to my mind, as a call to renewed exertion for this object.

And now, in conclusion, if the remarks offered and the facts stated have tended to show that it is not through the exclusive adoption of any one of the means which have been pointed out, nor by any infallible specific, that the benefits of a healthy dwelling can be extended to all classes of the working population, I yet entertain a sanguine hope that through the general and earnest adoption of a combination of suitable measures, existing evils will be greatly mitigated, if not entirely rooted out. Such an expectation is warranted by the well-known results of the improvements in our prisons, which are no longer hotbeds of fever and of moral contagion as they formerly were. Whilst the ameliorations very recently introduced in our military barracks and hospitals have led to a diminution by one-half in the mortality of their inmates, as was lately stated by the Chancellor of the Exchequer.

Encouraging facts like these should stimulate all to exertion in their various spheres of action, in order that the laboring population may, to apply the words of his Royal Highness the lamented Prince Consort, adopted for my motto, participate "in the blessings bestowed on us by the Almighty," but which, in their case, "can only be realised in proportion to the help which we are prepared to render to them."

LIVERPOOL ARCHITECTURAL SOCIETY.

THE ninth meeting of the present session was held at the Royal Institution, the President, Mr. J. M. HAY, in the chair. The usual donations were announced by the Secretary, Mr. W. H. PICTON, who also directed attention to specimens of enamelled tiles presented to the museum at the Free Public Library, by Captain Anderson, of the steamship *Europa*. They had been brought from a pagoda at Pekin. It was supposed that they formed part of the celebrated porcelain tower, erected 500 or 600 years ago, but lately destroyed. The production of these specimens evoked a discussion as to the desirability of using absorbent or non-absorbent materials in the erection of buildings, the general opinion being in favor of absorbent materials.

The paper for the evening was "Notes on a Recent Visit to Normandy," by Mr. J. A. PICTON. Having apologised for his absence on a former occasion, when he was announced to read a paper to the Society, stating that he was prevented doing so by a serious illness, Mr. PICTON intimated that he was not prepared to give them an elaborate disquisition. He would merely give them the result of his observations just as he jotted them down whilst on a short tour through that strange country, Normandy; he had not had time to write them out at length. He then proceeded to give some details respecting the architectural features of the principal churches he inspected on his route, the general aspect of the localities in which they are situated, &c. The peculiarities of the styles of the various edifices were also pointed out.

THE PROGRESS OF TELEGRAPHY.—At a dinner given in Liverpool, to Sir Charles Bright, of the Magnetic Telegraph Company, Sir Charles, in his speech, made some interesting statements referring to the progress of telegraphy in this country. Ten years ago, he says, the Company's staff did not exceed a score of people, now it amounted to about 1,500. At that time there was only one telegraph in the country, now the mileage was computed at 15,000. The total amount received for telegraphic messages in this country in a year amounted to the enormous sum of £350,000. The Government line between Malta and Alexandria, Sir Charles said, produces a revenue of £600 a week.

TEMPLE BRIDGE COMPANY.—The prospectus of the Temple-bridge Company has appeared, proposing to erect a suspension bridge of three spans of 300 feet each across the Thames between Essex-street, Strand, and Princes-street, Upper Stamford-street, Borough. The capital is to be £70,000, with borrowing powers for £20,000. The contractors of the Lambeth-bridge are prepared to contract for the erection of the Temple-bridge for £45,000, taking one-third in shares. It is expected that the traffic will be little below that of Waterloo-bridge, which in 1861 was £22,000, but should it amount to only one-half of that sum, it will yield a return of 12½ per cent. per annum on the capital of the company.

THE JENNER STATUE.—The statue of Dr. Jenner has been removed to Kensington-gardens. It is placed on a pedestal in the vicinity of the bridge spanning the Serpentine, on the Bayswater side. This statue, it will be remembered, was some time ago placed near the Nelson Column in Trafalgar-square.

REMOVAL OF ST. THOMAS'S HOSPITAL.

A CORRESPONDENT desires to point out the advantages that "must accrue" by the removal of St. Thomas's Hospital from its present position to that of a more suitable site at Lewisham, both in a social or commercial point of view.

It is said the site in question is one of the most stately in the south of London, and the district of Lewisham is proverbial as the healthiest in the great metropolis. The estate has a gravelly soil, and is situate about 60 feet above the high road, on the apex of a hill, contiguous to that of Blackheath, and commanding lovely scenery; the air, light and bracing, is of the purest, and free from the smoke of London or neighbouring factories, and will tend materially to the rapid restoration of the convalescent patients.

It is mentioned that the rate of mortality for 1,000 in Southwark is 33, whilst that of Lewisham is 17 in 1,000, or about one-half.

THE STEAM REGENERATOR.

LAST Saturday a large number of gentlemen connected with the press and engineering science attended at Collinge's Patent Axle Works, Westminster-road, for the purpose of inspecting a "steam regenerator," perfected by the joint labors of Mr. Imray and MM. Pigua and Datchy, and lately attached to the steam-engine in that establishment.

The object of the apparatus is to condense and again employ the steam after it has acted on the piston. This is effected by conducting it into an iron chamber, over the outside of which a stream of cold water is constantly flowing; it is there condensed into water, still at a high temperature, and in that state is pumped into a chamber in connexion with the boiler, where, being again converted into steam, it passes into the boiler itself.

The inventors say that, by constantly employing the same steam, the feed-water, which usually exceeds 25 gallons daily per horse-power, is reduced to less than one quart daily, a quantity required only to make up for the unavoidable leakages at joints, packings, and valves; there is thus a saving of more than 99 per cent. on the feed-water, and a consequent reduction of boiler surface and capacity. That, no cold water being thrown into the boiler, and all the feed-water being perfectly pure and distilled by its continual circulation, there can be no sudden changes of temperature, and no deposit or incrustation. And that, from the reduction of the quantity of feed-water, from the increase of effective steam-pressure caused by the vacuum formed in the receiver, and from the complete prevention of deposit and incrustation in the boiler, there results a proportionate saving of fuel—a saving which amounts to 50 per cent. for high, and 32 per cent. for low-pressure engines.

The experiments showed that, with the apparatus attached to the engine, the strokes of the piston were 50 per minute, while, with the apparatus detached and the steam blowing off, the revolutions were reduced to 30 per minute.

LIGHTING RAILWAY TRAINS.—Mr. Newall has recently applied to several of the passenger trains of the Lancashire and Yorkshire Company his method of lighting railway carriages with gas. The trains to which these lights have been applied include the fast trains between Manchester and Bradford, and Manchester and Blackpool. The London and North-Western Company are about to avail themselves of this mode of lighting some of their fast trains, and among others to the limited express between London and Holyhead. Mr. Newall is now fitting up carriages for the last-named train at Bury. By means of compression by hydraulic power the quantity of gas required for one of these trains is contained in a box of small size in the guard's van, and the advantage derived from these lights by the passengers are spoken of in high terms. As an improvement upon the lamp at present used in railway carriages, and in which the supply of oil to the wick is regulated by a bird-fountain. Mr. Alexander Allan, in a paper read before the Institute of Engineers in Scotland lately, proposed the dip-pipe fountain lamp, which he states will maintain the oil in the burner dish at a constant and invariable level, thus insuring the uniform saturation of the wick, and a steady flame under all circumstances. Mr. Allan uses in connexion with the lamp fountain a tube, which is inserted through the filling screw, and descends down the fountain and oil tube to the level at which it is desired to maintain the oil in the burner dish. Whenever the surface of the oil in the dish falls below the level of the lower end of the dip-pipe, the surface also falls below the bottom of the dip-pipe, and a bubble of air passes from the latter, and rises to the surface of the oil in the fountain, liberating exactly as much as and no more than will restore the true level in the dish, and this action will continue so long as there is waste by burning, and until the oil is exhausted.

CO-OPERATIVE OIL AND COLOR SOCIETY.—It is being endeavored to form a company for the purpose of manufacturing and supplying "genuine white and red lead, zinc, paints, and colors of all descriptions, ground and dry, mixed paints ready for use, wood stain, unadulterated, raw, boiled and refined linseed, and all other oils used for burning and painting, and every article requisite for the oilmen and painters' trade. Also to lease or purchase manufacturing premises, and erect machinery for grinding and pressing the raw materials into the different products, and sell the same at a trade price to the shareholders of the society or company at a month's credit." In a copious list of those whom it is presumed will apply for shares are ship chandlers, oil and colormen, country ironmongers, chemists, grocers, and—architects!

WOOD FOR SHIPBUILDING.—Professor Craze Calvert is now making an investigation for the Admiralty of different kinds of wood used in shipbuilding. It appears that the Professor is at no loss to explain why so many of the fleet of recently-built gunboats became rotten and others escaped untouched. He finds the goodness of teak to consist in the fact that it is highly charged with caoutchouc; and that, if the tannin be soaked out of a block of oak, it may then be impregnated by a solution of caoutchouc, and thereby rendered as lasting as teak. A few years ago an enterprising individual spent £30,000 in trying to introduce a new wood for shipbuilding purposes from South America, where it is known by the name of Santa Maria, but the dockyard authorities could not be persuaded to take it into use, and the imports were entirely neglected. This is one of the specimens investigated by the Manchester professor; and he finds it to be sound and resinous, and but little inferior to teak. Of the durability of teak there can be no question.—*Engineer*.

* Our readers are requested to correct, in the last Number of the BUILDING NEWS, at page 88, the following error in the note. The first item of net amount should be £295 0s. 10d., instead of £293 0s. 10d.

CHURCH, CHAPEL, AND SCHOOL BUILDING.

St. Paul's, Hooton, Cheshire.—This building, erected at the sole expense of Mr. R. C. Naylor, of Hooton, has just been consecrated. The edifice consists of a nave and chancel, with transepts surmounted by a lantern at the intersection. The nave has side aisles; and the chancel, terminated by a semicircular apse, is surrounded by an ambulatory. The central lantern rises on a square above the four central pillars, chamfered off into an octagonal base supporting the lantern, which is crowned by a pyramidal spire. From the western extremity of the chancel, on the south side, a small open arched cloister projects, over the south end of which there rises an open arched belfry bearing a figure of St. Paul as its finial. This is the private entrance from Hooton-hall, and beneath it is built the family burying vault. On the side of the chancel, opposite to the private entrance, is a small vestry. Exteriorly the church is substantial and plain rather than elaborately enriched; but some effect has been obtained by the arrangement of the stone of which it has been built. One of these is the Stourton stone, of a warmish grey color; the other is a dark red stone, got from quarries on the Hooton estate, near Eastham. The window and door dressings, and the window shafts, are of Hooton stone, with the exception of a band or two of Stourton stone, the external pillar shafts are of Hooton, and the capitals of Stourton. At the central tower Mr. Colling has crowned the intersection by a hemispherical dome, constructed alternately of courses of red and grey stone. The eastern or altar windows are small in size, in accordance with the general style of the architecture, and three in number. They are filled in with stained glass, the centre one representative of the Crucifixion; the northern, Christ Bearing his Cross; and, the southern, the Descent from the Cross. The ambulatory, already spoken of, is cut off from the chancel by a double row of slender pillars, whose shafts are of polished Peterhead granite, supporting semicircular arches, carried round the chancel, on which rests its main wall. The chancel is fitted with open pews of oak. The altar itself is massive, and almost destitute of ornamentation. Abutting on the north-east column of the central tower is placed the pulpit, cut from a square block of Caen stone, highly ornamented, an angel's bust, sculptured in relief on the west front, supports the book board. In the west front of the base of the south-east column is sunk a brass plate, on which is engraved in mediæval characters:—"Gloria in excelsis Deo." This church, dedicated to the Apostle St. Paul, was erected by Richard Christopher Naylor and Mary Sophia, his wife. This stone was laid by them on the 5th day of October, in the year of our Lord MDCCCLXIII., and the 21st year of the reign of Her Majesty Queen Victoria. James Kellaway Colling, architect; Samuel Hild Holme and John Nicol, builders." The side aisles are divided from the nave by a range of short massive columns, with shafts of polished Peterhead granite, supporting on semicircular arches the main wall of the edifice, which, like all the other portions of the interior walls, are composed of alternate courses of the red and grey stone. Above the western window is a wheel window, filled in with stained glass, by Clayton and Bell. The nave is seated with open benches, of stained and varnished pitch pine. The floors are laid with encaustic tiles. The capitals of all the columns in the interior are of Caen stone with natural foliage. The font is of Cornish serpentine, polished, and elaborately carved outside in diaper work. The bowl is supported on a cluster of five columns. This font is one to which a medal was awarded at the Great Exhibition of 1851, and was purchased by Mr. Naylor to be put up in the church. The church is supplied with heating apparatus, and is seated to accommodate about 300 persons, besides the children attending the schools, who are accommodated in the ambulatory on the north side of the altar. In total length from west to east it measures 105 feet. Its width across the transepts is 52 feet. The width of both the nave and the chancel is the same, namely, 19 feet; and the aisles on each side are 8 feet wide. The total height of the lantern is 95 feet. Mr. J. K. Colling was the architect, and Holme and Nicol, of Liverpool, the contractors.

Leicester.—St. John's Church.—The circular window at the west end of this church was filled last week with stained glass, in memory of the late Mr. W. Hardy. In the centre of the window is an Agnus Dei, surrounded by a circle of adoring angels bearing various musical instruments. One of the angels holds a scroll inscribed with the words, "Dignus est Agnus qui occisus" (Worthy is the Lamb that was slain). The rest of the window is filled with a diaper pattern executed in warm colors on a groundwork of grisaille. Mr. Wailes is the artist.

Nailsea Old Church.—The parish church of Nailsea, near Bristol, whose original construction dates back five centuries, and which had fallen into a most lamentable state of dilapidation and decay, has, during the last twelve months, been undergoing renovation and restoration. The church, which has the characteristic Somersetshire tower, consists of a nave and south aisle, and is dedicated to the Holy Trinity. The edifice has been partially restored on many previous occasions, and the oak roof and south aisle, which have been allowed to remain, bear date about 1700. The unsightly gallery in the south aisle has been removed. All the existing windows are new, and the stained glass which was scattered through them has been collected and placed in one of the east windows. A new open stained deal roof has been put up in the chancel. The walls have been replastered, and during the process a priest's door, which had been concealed from view, was discovered in the chancel. The roof of the church has been re-slatted. The entire cost of the work has been about £1,000. The work has been executed under the direction of Messrs. Fripp and Co., architects, of Bristol, by Mr. Robert Newton, of Nailsea. The glass was provided by Mr. Bell, of Bristol.

Rochester.—St. Nicholas' Church.—The works in connexion with the rearrangement of the interior of St. Nicholas' Church, and the alterations and additions made to that edifice are in such a forward state that in a few weeks the whole will be completed. The whole of the pews, some of them dating two centuries back, have been swept away, and in their places have been erected open seats. A gallery has also been erected round the church. The alterations effected will provide sitting-room for about 670 persons. A stained-glass memorial window, by C. Gibbs, of Marylebone-road, has been erected at the east end, over the communion table, in place of the small oriel window which formerly lighted that part of the chancel. This window, which is now completed, is divided into several compartments, the centre one of which represents our Saviour raising the widow's son at Nain. The organ has been removed from the western end of the church in order to exhibit a large stained-glass window. The south-west window is also to be filled in with stained glass. The organ will be placed in a gallery especially built for it in the north-west end of the church. —We understand it to be the intention of the Dean and Chapter of the Cathedral to remove some of the old houses in High-street, which belong to the

capitular body, and which now so greatly disfigure that portion of the city, in order to open a new entrance to the cathedral and the deanery. The houses intended to be removed are now all empty, and it is stated that the demolition of the unsightly blocks of buildings will shortly commence.

Higham, Kent.—St. John's.—This new church, dedicated to St. John the Evangelist, is constructed of Kentish rag-stone, with Bath stone dressings and slated roof. It consists of nave, side aisles, tower and spire, and a chancel. There is a vestry-room on the north side of the chancel. It will afford accommodation for about 400. The cost of the building was £2,624. Messrs. Peck and Stephens, of Maidstone, were the architects, and Mr. G. Myers the contractor.

Dublin.—The New Presbyterian Church, Rathgar.—The foundation stone of this church was laid about eighteen months ago. The style of architecture adopted is the decorated Gothic, and the material used is granite, with dressings of Portland stone. The shape of the building is cruciform. There is a ground floor forming a large apartment, which is used as a schoolroom. Above this is the church itself, which is approached by a gradual ascent. The length of the building is about ninety feet, its breadth about sixty, and its height from the ground floor to the roof is fifty-five feet. There are sittings for upwards of 500. Stained glass, in which blue and crimson are the dominant colors, has been freely used, and above the pulpit is a rose window, filled in with stained glass. The roof is formed of open timber, varnished, and supported by pillars which rest upon carved stone corbels. The gallery occupies a portion of the nave facing the pulpit, and is placed immediately over the vestibule. The pulpit stands upon a high platform, which is surrounded by an open balustrade of trefoil arches; underneath is space for the choir. The architect was Mr. Andrew Herton; Messrs. Cockburn were the builders.

Brandon Parva, Norfolk.—The parish church has recently been restored. The old roof has been entirely removed, and a new one constructed, of oak with curved principals and moulded purlins. The windows, buttresses, and stonework have been cleaned off; the walls of the church and chancel stuccoed, and a new south porch built. Plans have also been prepared for the entire re-seating, with new pulpit and reading-desk, which will be carried out as soon as the necessary funds shall have been raised. The present works have been executed by Boardman, of Norwich, under the superintendence of Mr. J. D. Ellis, architect, of that city.

Lincoln Cathedral.—We learn that for some months past the Committee of the Lincoln Diocesan Architectural Society has been in communication with Mr. George Gilbert Scott as to the design for the pulpit about to be presented to the Cathedral as a public testimonial to the Rev. Edward Trollope. At the desire of the Chapter, the pulpit, when finished, will be placed at the eastern end of the northern range of stalls, and immediately in front of the south-western pier of the upper or eastern transept. From a moulded base of Caen stone rises a solid circular pillar, surrounded by six colored marble or granite shafts, with worked capitals; these support a stone capping; upon this the pulpit proper is placed, of a hexagonal form, and of oak, enriched with carvings. At each angle there will rise, upon brackets, figures of the Four Evangelists, placed within ornamented niches, surmounted by canopies, and on the panels between these the subject of "preaching" will be set forth by carvings in high relief inserted within enriched frames or borders—the series comprising Moses, Elijah, John the Baptist, St. Paul, and St. James, in the act of making known the Word of God to man. The whole will be surmounted by carved capping, and a book-rest supported by an angel. There will also be a canopy, of carved oak. The pulpit will be approached by a stone staircase, with a wrought hand-rail of brass work.

CHAPELS.

Hull.—A new Wesleyan chapel was opened on the 16th inst. It has a frontage to the Beverley-road of one hundred and twelve feet, and stands back forty-five feet from the road. The style is Decorated Gothic; all the external walls are faced with the Wallingford white stock bricks, the masonry and other dressings are generally of Brodsworth stone. The Beverley-road elevation is divided by buttresses into three spaces, having a doorway in each, with columns of red Mansfield stone and foliated capitals. There is on each side of the central doorway a two-light window, the hood mouldings of which are united with those of the doorway, and rise triangularly from carved terminations, forming three small gables, with finials. Above the central doorway is a five-light moulded window, with tracery head, running up into the roof gable; and above each of the side doorways is a two-light window. Octagonal pinnacles rise from the principal buttresses, and square pinnacles from the heads of the side buttresses. The gable is surmounted by an octagonal turret, with two stages of arches, and a small spire, the projection before the face of the wall resting upon a moulded and carved corbel. In the front of the chapel is a wing on each side for the gallery staircases, and the flanks of the building are divided by buttresses into bays, with two tiers of tracery windows. The eaves are finished with an iron gutter, resting on stone blocks. The roof is covered with Westmoreland slates, having an ornamental tile crest on the ridge, and louvred ventilating gables on each side. The windows are glazed with Hartley's patent quarry glass. The pulpit is placed in the centre, near to the end of the chapel. It is octagonal in form, resting upon a pedestal, with tracery panels on the sides and circular shafts at the angles, with carved capitals and trefoil arches. There is a gallery on two sides and one end of the chapel, supported on clustered iron columns. The plan of the chapel is a parallelogram, 90 feet in length by 54 feet in width. The side walls are 32 feet in height from the floor of the chapel, which is two feet above the level of the finished ground on the outside. The roof of the main building is in one span, the framed principals of which have curved wall braces springing from moulded and carved corbels. The ceiling is of lower pitch than the roof, and rises from the side walls at an angle of about 30 degrees, being in the centre 45 feet from the floor of the chapel. It is divided by moulded ribs into panels, colored blue. At the rear of the chapel are a vestries, and class-rooms. The whole of the interior woodwork (with the exception of communion rail and handrails to staircases, which are of oak) is executed in red fir, stained and varnished. The lighting of the chapel is by ten corone of mediæval design, suspended from the intersection of the ceiling timbers, and by brackets of similar design from the walls under the galleries. The heating is by the patent gill air-warmer, placed in a vault at the rear of the building. Ventilation is secured by means of perforated zinc panels in the ceiling, with a simple apparatus for regulating the same at pleasure, and by air flues with valves carried up in the side walls, opening near the gas burners under

the galleries. The heated air is carried off from the space above the ceiling by the louvered gables. The sitting accommodation is for 1,150 persons, 550 of which are on the floor of the chapel, and 600 in the galleries. The amount of the contracts, including lighting, heating, and fencing, was about £5,600, and the cost of the site about £1,200. The works have been executed by several contractors. The excavators', bricklayers', and plasterers' work by R. Bailey; the masons' work by Simpson and Malone; the carpenters' and joiners' work by James Jackson; the plumbers' and glaziers' work by P. T. Harrison; the slating by Dawber and Son; the iron work by Pearson, Dannatt, Kruger and Co.; the painting, staining, and varnishing by W. Wardale; the gas-pipes by Stones, Settle, and Wilkinson, all of Hull; the gas-fittings by T. Brawn, of Birmingham; and the heating apparatus by Stuart and Smith, of Sheffield. Mr. W. Botterill, of Hull, is the architect, Mr. C. Pulman having acted as clerk of the works.

Tunstall.—*New Independent Chapel.*—This building, which is situate in High-street, has been erected from the designs of Mr. Edwin Boon, of Burslem, and is of a mixed style of architecture, the dimensions being 56 feet by 36 feet. A transept forms the chapel, capable of seating 325 persons, and the wings at each end constitute the schools, which are adapted so as to open to the chapel. Galleries are placed over the class-rooms. The total accommodation will be 625 sittings. The builders were Messrs. Cawley and Curran, of Tunstall; the total cost of the building, including heating apparatus, gas fittings, &c., is £500.

SCHOOLS.

Manchester.—The extension of the school for the deaf and dumb, Old Trafford, is now completed. The additions consisted in extending the back part of the building 24 feet for a printing office, additional play-room, sewing-room, and assistants' room, and also to increase the size of the school-room and dormitories, now making each 77 feet 6 inches by 27 feet 6 inches. The object in view was, not to accommodate a larger number of pupils, but to give more space to the existing inmates, with a freer circulation of air. This has been accomplished by a system of ventilating shafts round the rooms conducted into flues, the air of which is rarefied by the heat of a smoke shaft adjoining. The dormitories have louvres placed in the roofs, and the cubical space for each individual has been increased from 430 feet to 630 feet (still below the mark). Messrs. Southens, of Salford, were the builders, their estimate being £1,120, whereof £40 was deducted for old materials. Mr. James Redford, of Manchester, was the architect.

Stapleton.—*New Culston's Schools.*—These school buildings have been arranged for the reception of 120 boys. The buildings contain on the ground floor three school-rooms, about 32 feet by 24 feet each, besides two smaller class-rooms, a chapel, a spacious entrance-hall with stone staircase, a dining and examination hall, 65 feet by 31 feet, and 18 feet high, with a spacious vestibule leading to the play-ground; usher's sitting-room, surgery, consulting-room, and the usual domestic offices, with bed-rooms for servants over the latter, and communication therewith. On the first and second floors are the boys' dormitories, ushers' sleeping-rooms, sick wards, wardrobes, store-rooms, &c., and on the basement floor the boys' lavatory, shoe-rooms, bath-rooms, and dressing-room, &c. At the extremity of the new dining-hall, and communicating therewith, a new residence for the master has been erected, containing entrance-hall, two parlors, study, three bed-rooms, dressing-rooms, store-rooms, &c. The works have been executed by Lewis and Sons, of Clifton, under the superintendence of Messrs. Fosters and Wood, of Bristol, architects to the trustees. The entire cost of the alterations has been under £3,000.

Caverswall, Staffordshire.—New school-rooms have been erected at this place. The buildings consist of a room 40 feet by 18 feet, an infant school-room, 27 feet by 18 feet, and a residence for the teacher. The materials are red brick intermixed with blue, with stone mullions, and dressings for the windows. The roof is open, of pine, stained and varnished. The erection of the building was commenced in July, and the children assembled for the first time on the 5th of January. Mr. Dain, of Burslem, was the architect, and Collis and Hudson, of Longton, the builders.

Long Ashton National Schools.—This building is in the Early Decorated style, of Nailsea pennant stone, with freestone dressings, and comprises a dwelling-house for the master and mistress; a boys' school, 50 feet by 20 feet, able to accommodate 100 boys; a girls' school, 46 feet by 18 feet; to each school is attached a class-room. The boys' school is surmounted by a bell-turret, supported by four polished Purbeck columns, with carved capitals; underneath will be fixed a large dial. The work has been carried out by E. and J. Tucker, builders, of Long Ashton. The cost of the building was £2,200. Mr. James Wilson, F.S.A., of Bath, is the architect.

Reviews.

The Historical Finger-Post or Handy Book of Terms, Phrases, Epithets, Cognomens, Allusions, &c., in Connection with Universal History. By EDWARD SHELTON. 8vo. Lockwood and Co. pp. 376.

THIS is one of those epitomes of knowledge so popular in these days, when every one affects to be "well read." Books of this class save a world of trouble, there is no doubt, but it is very much to be doubted if they tend in any way to the advancement of sound education, the temptation to rely on their aid is so great to lazy memories, that it must result in the neglect of more studious reading, which can alone give the real historical connexion between the disjointed facts which it has been the custom to crowd into "Handy Books."

To those, however, who possess but a superficial acquaintance with historical events, the book before us will be of use, so long as they do not entirely rely on it to supply deficient knowledge, which, at the best, it can but partially do. It is offered as aid to those readers of general literature who find it impossible to take up a newspaper, periodical, or an ordinary volume, without meeting with allusions of an historical character, which may have never been met with before, or which have been forgotten.

The allusions and phrases are divided into classes, and are easily found on referring to a very copious index. The work is not quite so free from errors as might be wished, but will, within proper limits, be found of assistance to the particular, and, perhaps, large, class of readers to whom it is addressed.

NOTES FROM THE PROVINCES.

Cliff Town, Southend.—A new town is rapidly rising to the westward of, and quite distinct from, Southend. The houses are built of white brick, with freestone dressings. They are constructed in terraces laid out on the summit of the cliff, connected diagonally at intervals in such a way that those lying back get sea views in one direction. The front basement and parlors have bay windows; the first floor is fitted with French casements, opening on to a slate balcony, formed on the top of the bay window. The houses are of various classes, differing in size, in position, and in rental. The row facing the sea consists of twelve fourteen-roomed houses, surrounded by gardens; forty-five are ten-roomed houses, laid out in six terraces, having gardens; twenty-seven laid out in three terraces, contain seven rooms; and thirty-two six rooms, also forming six distinct terraces. In addition to the above there is a row of eight houses, built as shops, containing ten rooms and two store-rooms. The rental of the private houses varies from £60 a year for the first-class down to £20 for the smallest. The spaces between the rows of houses are turfed and planted out with trees and shrubs. Cliff Town was erected by Messrs. Lucas Brothers, Mr. W. Mitchell being clerk of the works. Very few of the houses are unoccupied, and the experiment is said to be so successful, that it is in contemplation to increase the number, and to add a church, an hotel, and a library and reading-room.

Improvement of Rochester.—A meeting of the Estate Committee of the Corporation has been held, to take into consideration the erection of the new town quay, the plans and drawings for which were laid before the committee by Mr. Andrews, the city architect. The new quay will occupy, as nearly as possible, the site of the old town quay, which was taken by the bridge wardens, several years since, on the occasion of the building of new Rochester bridge, and who have presented the city with the site on which to erect the new quay, a vacant piece of ground between the railway bridge and the offices of the water-bailiff. The plans were approved, and the work will shortly be commenced. The cost will be from £1,000 to £1,500.

Malton.—Operations have lately been in progress for exhuming the contents of two ancient tumuli—one on the Howardian Hills in the North Riding, the other on the East Riding Wolds. The first tumulus opened was upon Amotherby Heights. After removing a portion of the mound and excavating below the reach of modern tillage, it was found the tumulus had been previously opened, and, but for the accidental discovery of a British urn, the work would have been abandoned. This urn was of the cinerary group, of baked clay, and ornamented by dots, as if made by the end of a stick when the clay was in its softest state. The discovery of this urn led to the inference that a double burial had taken place in the tumulus, as the centre (the usual place of sepulchral deposit) was not reached. It was, therefore, resolved to continue the explorations, and the searchers were rewarded by the discovery of another urn, also of slightly-baked clay, but profusely ornamented, and having four claws or feet. This was also a cinerary urn. The first-named urn has been added to Sir George Strickland's collection; but it is to be regretted that the second and most valuable was, while being dried before a fire, crushed to atoms. The two following days were devoted to the opening of a large tumulus on the wolds above Sir George Strickland's seat at Newton. This ancient burial-place was of considerable size. The men encountered quantities of flint, which, being removed, disclosed the fact that the cist, or pit, had fallen in (having been walled with unhewn flint stones), the removal of a portion showing the skeleton crushed to fragments. Portions of a Saxon urn were found near the head. No ornaments or weapons were found. In the neighborhood, during marling operations, portions of pottery have been discovered, which seem to indicate the high lands of the wolds to have been under Anglo-Saxon occupation.

Liverpool and Birkenhead.—*Memorial to the late Prince Consort.*—At a meeting of the Liverpool Town Council, the special committee on the memorial to his late Royal Highness the Prince Consort stated that, after having considered the letter of the Lord Mayor of London, they were of opinion that it was the unanimous feeling of the inhabitants of the town that all funds raised in the borough for the above object should be expended in a local memorial to the late Prince. They recommended that an equestrian statue of the late Prince Consort be placed in the area on the east side of St. George's Hall, and that a sum not exceeding £5,000 be appropriated for this purpose out of the borough fund. Mr. Still objected to the statue, and believed that the £5,000 would have been better devoted to a suitable building in which to enshrine art treasures. The Council, however, almost unanimously agreed to the recommendation of the committee. Mr. Jackson, M.P., has offered to erect a statue in the Birkenhead Park at his own expense.

Brighton.—*Drainage.*—The Town Council of Brighton have held a special meeting upon the question which has been forced upon their attention—the complete drainage of the town. The special business of the meeting was to receive a report from the Town Surveyor (Mr. P. C. Lockwood), submitting for approval a drainage scheme, involving an outlay of £75,000. The Surveyor's plan is to drain into the sea by means of a central sewage pipe 30 inches in diameter and 1,000 feet in length, beyond the margin of the sea, the south end of this pipe to be 18 feet below the mean level of the sea. In the Surveyor's opinion this mode of draining the town will not be attended with any unpleasant results; it will neither affect the bathing nor the purity of the air, upon which the prosperity of Brighton so much depends. It was resolved that this report be approved and referred to the Works Committee, for them to consider the proper steps to be taken for proceeding with the works with as little delay as possible, and for raising money to defray the expenses.

Edinburgh.—*The Late Catastrophe.*—Two reports, by professional men, on the fall of the tenement in the High-street, on the 24th of November last, are in the hands of the authorities. One of these is the joint report of Messrs. Leslie and Stevenson, civil engineers, to whom the matter was remitted by the Procurator-Fiscal two days after the fall of the building. It is understood that these gentlemen attribute the catastrophe to the subsidence and ultimately sudden fall of the wall running from east to west which existed in the centre of the building, and that such fall was occasioned by the wall having been on the lower floors pierced by successive alterations for the "improvement" of the property till it became quite incapable of sustaining its own weight, independently of that of the upper floors, the joists or beams of which ran into and rested upon it. The other report is by Mr. J. D. Peddie, architect, made subsequent to, and with knowledge of, Messrs. Stevenson and Leslie's report. It is understood that Mr. Peddie substantially concurs in those gentlemen's views of the causes of the catastrophe, though he attributes more weight to certain specified alterations of the central wall than they do. We believe that Mr. Peddie also expresses much

regret that examination of the building had not been made immediately on symptoms appearing of the subsidence of the wall; and also that the examinations on the Saturday previous to the catastrophe on Sunday morning, which were only partial, had not been more searching and complete.

Leighton Buzzard.—New Corn-exchange.—A number of men have been set to work to take down the old premises, which for many years was known as the George Inn, to make way for the contemplated new Corn Exchange. We hear it is intended to have the building proceeded with as quickly as possible, so that it may be expected to be erected in a few months, and opened for general business during the coming summer.

Chichester.—The Ruins of the Cathedral Tower.—A sale by auction has been held in the Cathedral yard of the greater portion of the stone which belonged to the older structure. All the moulded stone has been carefully preserved, either to be worked into the new structure, or to serve as models for its restoration; the stones which have been considered useful for the rebuilding have also been retained. A considerable quantity has, however, been declared useless for the purpose; it is this which has been disposed of. The total sum realised was £235 odd, the price being rather above the price of bricks at the same measurement.

Twerton.—New Bridge over the Avon.—A new bridge has lately been built at Twerton, across the river Avon, for Messrs. Carr and Co., clothiers. The bridge is built on the principle of the Bowstring Girder Bridge. It is 116 feet in length between the abutments. It is simple in detail, and there is no tie-beam or tie-rod required to keep it from expanding, the floor forming the tie or string of the bow. It is composed principally of wood, and is said to have been built by two carpenters and a smith (not including the smith's work) in less than twelve days of nine hours each. It took three days to get it across the river, but much time was wasted from the want of proper materials. The weight of the bridge is about 4½ tons; it is called the "Aerial Bridge."

Leeds.—The success which followed the experiment of erecting ten model cottages at Beeston Hill has induced the gentlemen who initiated that project to propose to build eight other dwelling-houses at Burley-lawn, upon the same improved principles, and at such a moderate cost as to place them within the reach of the limited means of working men. The foundation-stone of the second set of cottages has just been laid. The site on which they are to be erected is on a spot of ground forming a portion of the Burley-lawn estate, just beyond the Viaduct. Each house, upon the ground floor, will possess a parlor 15 feet 8 inches by 12 feet; a living-room, or kitchen, rather larger, and beneath these cellars, pantry, coal-place, &c. They will have separate front and back gardens; and on the second floor of the house there will be three bed-rooms, the two end houses having each also a couple of attics in addition. This accommodation is a slight improvement upon the houses at Beeston, and the expense will be proportionately increased. The six smaller houses will cost about £160 each, and the end houses from £180 to £190.

Hull.—A home for the laboring poor is now being erected in this town, at the junction of Midland-street and St. Luke's-street, by the Society for Improving the Condition of the Laboring Classes. The accommodation provided is for thirty-two families, each having a long room, scullery, and one, two, and three bed-rooms, according to the number of children. The cost is £3,435, exclusive of land. Mr. H. M. Eyton is the architect, and Messrs. Simpson and Malone are the builders.

Bideford-bridge.—On Wednesday se'night a joint meeting of the Bridge Trustees and Town Council was held, to consider the subject of widening the bridge. It was resolved to send Mr. Page his plans, together with his reports, that gentleman having intimated that he had no doubt he could modify and improve them so as not to exceed the original sum named for widening the bridge—viz., £3,500.

IMPROVEMENTS IN BUILDING, &c.

WINDOW-SASH FASTENER AND DRAUGHT EXCLUDER.—Dated July 6, 1861.—J. E. Reid, Fleming-road, Newington.

This consists of a hollow bar of brass or other metal fixed horizontally on (and the entire width of) the upper side of the meeting rails of sashes to ordinary windows, immediately over the cavity formed by the junction of the inner and outer sash. It is fixed by means of a continuous hinge partly let into the wood of the inner sash rail, and being in shape half round, or semicircular in section, it forms, when closed, a bridge over the before-mentioned cavity, its opposite edge falling into a small groove cut in the outer sash, thereby effectually excluding all draught. The ordinary catch of the present sash-fastener is not required, in lieu of which the hollow bar is made solid in the centre or point opposite the bolt, and a quadrant shaped slot is cut in a transverse, and also in a horizontal direction, to allow of the free traverse of the spindle of the bolt.

MACHINERY FOR CUTTING, SHAPING, AND DRESSING STONE, &c.—Dated June 28, 1861.—J. W. Graham.

The stone is placed upon a bed or table to which a reciprocating sliding motion is imparted. Above this table a beam extends from end to end of the machine, upon which an adjustable framing is supported, carrying an arrangement of bevil gearing in connexion with toothed wheels, which are attached by cranks to a tool box containing the chisel or chisels, and at the required angle for cutting; and the upper portion of this tool box is furnished with a weight by which the chisel is caused to cut or chip the stone. When motion is imparted to the gearing, the cranks will cause the chisel in the tool box to make a succession of strokes upon the stone, which, by the effects of the weight or hammer, will cause the stone to be cut or chipped to any form or size, which together with the depth of the cut may be regulated or controlled by the attendant. In order that the edge of the chisel may not become unequally worn, it is turned half round at each stroke by a crank or other means, so that each side is presented alternately to the stone.

INDURATION AND PRESERVATION OF STONE AND OTHER ANALOGOUS SUBSTANCES OR MATERIALS, AND THE PRODUCTION OF ARTIFICIAL STONE.—Dated July 9, 1861.—F. S. Baril.

This consists in using solutions of the alkaline silicates combined with the aluminate of potash or other suitable re-agent in such proportions as to allow sufficient time to elapse for manipulating the said solution, and thus enabling it, when applied to the surface of the stone or otherwise, to enter into and effectually penetrate the same. The solutions in combination with powdered pumice stone or other like material are also used for producing artificial stone for attrition, building, &c.

MIXTURE FOR EXTINGUISHING FIRE; APPLICABLE ALSO FOR PREPARING OR SATURATING VARIOUS KINDS OF MATERIALS AND FABRICS, FOR THE PURPOSE OF RENDERING THE SAME NON-INFLAMMABLE.—Dated July 5, 1861.—G. Williams.

The patentee claims combining into a mixture water, soda of commerce, alum of commerce, roach alum (or mineral salt), common salt, borax, oil of vitriol, and chloride of zinc, and the use and application of the said mixture for extinguishing fire and rendering materials and fabrics unflammable.

DRAWING BOARDS.—Dated July 19th, 1861.—E. A. Penley.

Here the object is to strain sheets of paper upon drawing boards without the necessity of using glue or other cement. The inventor proposes running an acute angular channel around the back of the board a short distance from the edge over which the edge of the paper is to be brought; wooden flaps are hinged on to the back of the board, and are provided with angular strips of wood to fit the channels. These hinged flaps are pressed down upon the edges of the paper which are turned over from the front, and the entire sheet becomes tightly strained without the use of paste, glue, or cement.

SEWER AND SINK TRAP.—Dated July 5th, 1861.—B. Fowler, Junr.

This invention consists of a square or other suitably shaped box, formed of iron, clay, or other suitable material, having the sides thereof flanging outwards from the bottom upwards, and having on the upper edge a ledge surrounded with a lip, upon three sides of which the lid rests when closed. The back ledge is formed a little lower than the front and side ones, and the back of the sides of the box is hollowed out to receive the lugs on the under side of the lid, by which it is jointed to the sides of the box by a horizontal transverse pin or pins. The bottom of the box is formed with an oblong hollow truncated pyramid, which rises some distance inside of the box, and is open at the top. The grated cover or lid is cast with an oblong box in the centre, which, being open on the under side, surrounds the top of the truncated pyramid escape port when closed, but is not in contact therewith, the inverted box being sufficiently large to allow the water to pass up into the inverted box on the under side of the lid, and escape through the opening on the top of the truncated pyramid into the sewer, the sediment remaining in the bottom of the box, from which it can be readily removed.

PRESERVING AND INDURATING TIMBER, AND FOR RENDERING THE SAME NON-INFLAMMABLE.—Dated July 15th, 1861.—T. Cobley.

By this invention a strong solution of potash, baryta, lime, strontia, or any of their salts, or of the salts of any metallic or other base capable of forming an insoluble compound with hydro-fluo silicic acid, is forced into the timber, or other vegetable matter to be acted upon by hydraulic or other means, and this process is repeated until the material is sufficiently charged or impregnated with the solution to enable it to withstand the influence of flame. After the impregnation has been thoroughly effected with any of the solutions, hydro-fluo silicic acid is forced into the wood by analogous means, with a view to render the solutions insoluble.

FIREPROOF CONSTRUCTION.—Dated 22nd July, 1861.—W. Hood, Reading.

For the purposes of this invention hollow iron beams or girders are constructed in such manner that they may be rendered suitable for conveying water into and distributing it in the buildings where such beams or girders are used. Girders so constructed and employed will also, by reason of their having water supplied to them, be prevented getting red-hot in case of fire, which would render them weak, and unequal to resist the weights thereon. The hollow beams or girders are made of iron and suitable angle iron, as common heretofore, and they are also closed at their ends or other parts, as well as at their sides, and are suitably formed to admit of their being connected to supply pipes leading to water mains or other sources of supply; they are also made with suitable perforations for distributing the water supplied to them into the rooms or parts of buildings where such beams or girders are situated, by which means such beams or girders will not only be the means of conveying water to extinguish a fire in the locality where they are situated, but will, at the same time, be prevented from becoming highly heated by reason of the passage of water through them, and will thus be caused to retain the requisite strength for upholding the weights thereon.

TENDERS.

DWELLING HOUSES, BROMPTON.

For erecting 6 seven-roomed houses, Old Brompton. Mr. F. Kersey, architect.
 Patrick and Son..... £3,700 Bass £3,200
 Jackson 3,575 Freeman (accepted)..... 2,300
 Pearson..... 3,499

PAVING, LONDON.

For repaving the portion of Chancery-lane, within the Holborn district. Lewis H. Isaacs, C.E., surveyor.
 Aspinall £1,298 0 0 Mowlem and Co £1,265 0 0
 Stiles..... 1,287 0 0 Sewell (accepted)..... 1,207 10 0

SEWER WORK, HOLBORN DISTRICT.

For the supply of materials, and the execution of jobbing and measured works, required for the sewers and drains within the Holborn district for one year.
 Abbot and Hopwood..... 10 per cent. under schedule prices.
 James Heyard 18½ " "
 John Phillips (accepted)..... 21 " "

CEMETERY, WHITBY.

For the chapels, superintendent's house, and iron railing and gates, for Whitby Cemetery. Messrs. Pritchett and Son, architects.

Masonry.—Wood and Sons..... £1,140 0 0
 Slating.—Oberend 79 6 8
 Plastering.—Braithwaite 40 15 0
 Joiners' Work.—Readman 233 8 0
 Plumbing.—Brown and Son 65 12 0
 Painting.—Readman 18 10 0
 Ironwork.—Hutton 80 0 0

£1,637 11 8

Architect's estimate..... £1,680

CHAPEL AND SCHOOL, RYDE.

For erecting a Baptist chapel and school, at Ryde. Quantities supplied. Francis Newman, architect, Ryde.

Kemp £2,700 Jolliffe £2,300
 Sibley 2,574 Denham 2,200
 Smith 2,396 Meader 2,140
 Langden James and John 2,310

ALTERATIONS, LONDON.

For alterations at 1, Greek-street, Soho, for the House of Charity. Mr. Joseph Clarke, architect.

The chapel and extension not included.
 Houghton £2,069 T'Anson £1,869
 Brown and Robinson 1,977 Lawrence and Son 1,888
 Trollope and Son 1,940 Foster 1,815
 Piper and Wheeler 1,897 Ashby 1,562
 Warrin and Son 1,893 Conder (accepted) 1,493

COTTAGE, LEICESTERSHIRE.

For a woodman's cottage, North Kilworth, Leicestershire. Mr. Joseph Clarke, architect.

Bromwich £245 0 Law (accepted)..... £221 18
 Wells 225 0

HOUSE AND SHOP, HERNE BAY.

For building a house and shop, at Herne Bay. Mr. Benjamin Adkins, architect, Faversham.

G. Creed £747 0 C. Welby £390 0
 J. Kelson 693 12 E. J. Jell (accepted)..... 584 10

HOUSES, &c., SOUTHAMPTON.

For erecting houses, &c., at Southampton, for Mr. John Smith.			William Hives, architect, 23, Portland-street, Southampton.		
Hillier	£1,372	0	Philips	£1,132	0
Scott	1,264	0	Newton	1,121	13 5
Samuels	1,248	0	Ball	1,083	0
Gaulding	1,240	0	Rogers	1,072	0
Lewis	1,222	10	Jessop	1,070	0
Bailey	1,198	0	Martin	975	0

COTTAGES, ELTHAM.

For the erection of a pair of semi-detached cottages, at Eltham, for Mr. Charles Wilson.					
Mr. Thomas Chester Haworth, surveyor, Eltham.					
Blackhall and Gorrur	£726	J. and C. W. Todd	£319		
Elliott	615	J. Wass (accepted)	480		
Thomas O. Todd	540				

COMPETITIONS AWARDED.

WETTERBY WORKHOUSE.

We understand that nine designs were sent, in reply to the advertisement for this work, and that the one by Messrs. Pritchett and Son, of York and Darlington, has been selected, and is to be carried out by them on the usual terms.

COMPETITIONS OPEN.

BRIDGE.

BRISBANE RIVER.—The Municipality of Brisbane are prepared to receive designs and tenders for the construction of a bridge over the Brisbane river, at Brisbane, the capital of Queensland. The author of the best design, at the lowest cost, will receive a reward of £150, or be employed to carry the work out, providing he furnishes sufficient proof of his competency and experience in similar undertakings. A premium of £80 will be awarded to the next best design, and £40 for the next best. The plans, specifications, and estimates of the first and second designs will be retained by the Corporation as their property. The remainder will be returned to the competitors; but the corporation will incur no responsibility as to their safe delivery. Each set of drawings, and the documents accompanying them, are to be distinguished by a motto only, and accompanied by a letter in a sealed envelope, marked with the same motto, and containing the author's name and address, and such testimonials as he may think proper to furnish. Professional judges, being non-competitors, will be appointed by the Corporation to determine the merits of the respective designs. Eligible tenders for the work, accompanying the design, will be entertained. All drawings and tenders to be delivered at Gresham House, on or before the 15th of March next. Copies of the instructions to competitors, and the plan of the city, can be obtained of F. Mangels and Co., the Colonial agents, and agents to the Municipality of Queensland, 86 to 88, Gresham House, Old Broad-street, London, E.C.

HARBOR WORKS.

LYME REGIS.—The Borough Council require a plan, specification, and estimate for carrying out certain works at the Cobb or harbor there; to be sent in to G. Hingerton, town clerk, by March 1st, when the successful competitor will receive 15 guineas. Full particulars can be had at the offices of the Cobb clerk or town clerk, Lyme Regis.

CONTRACTS OPEN.

HOSPITAL.

DEVONPORT.—For the erection of the Devonport Stonehouse, and Cornwall Hospital, at Devonport. Drawings, &c., with Alfred Norman, architect, Ker-street, Devonport, until the 22nd February, where tenders, sealed, and endorsed "Tender for Hospital at Devonport," must be delivered not later than eleven a.m., on the 24th February.

CATTLE MARKET.

COLCHESTER.—For the formation of the New Cattle Market, in Colchester. Plans, &c., at the office of James Cooke, Esq., C.E., Colchester. Tenders, under cover, addressed to S. Turner, town clerk, Colchester, on or before the 17th Feb.

WAREHOUSES.

LEEDS.—For the erection of three first-class woollen warehouses, in King-street, Leeds. Plans, &c., at the office of Mr. Cuthbert Brodick, architect, 2, Park-place, Leeds, to the 10th February. Bills of quantities will be provided for parties requiring them. Sealed tenders, addressed to "The Directors of the Leeds King-street Warehouse Company, Limited," to be delivered at the Company's office, 1, Bond-place, Leeds, not later than February 19.

CHURCHES.

IRELAND.—For works to be executed at the churches of Island Magee (Kildollagh), and Ramoon, co. Antrim, Kildart, co. Armagh, Down (cathedral), co. Down, Kilsaran (Castibellingham), and Mansfieldstown, co. Louth. Plans, &c., with the resident ministers of the parishes. Tenders to be forwarded, sealed, prepaid, and addressed thus—"Proposals for the church of ———, the Ecclesiastical Commissioners for Ireland, Dublin," by February 22nd.

CHAPELS.

BRISTOL.—For the erection of the Clifton Wesleyan chapel. Drawings, &c., with Fosters and Wood, architects, 6, Park-street, Bristol, till the 28th inst., on or before which the tenders are to be sent to the architects, sealed and endorsed "Tenders for Clifton Wesleyan Chapel."

CEMETERY WORKS.

UTTOXETER.—For works to be done at the new cemetery, Uttoxeter. Particulars on applying to Benjamin Wilson, architect, No. 12, Corn-market, Derby. Tenders, endorsed "Tender for Work at Cemetery, Uttoxeter," to be delivered to A. A. Flint, Esq., Uttoxeter, on or before the 19th February.

PARSONAGES, &c.

YORKSHIRE.—For building a small parsonage house and offices, at Garnton, twelve miles from Hull. Tenders, to be prepaid, on or before the 20th February, addressed to the architect, Mr. R. J. Withers, 51, Doughty-street, London, W.C.

PERTH (N.B.).—For the erection of a new manse and office, at Dunning, Perth, N.B. Drawings, &c., with the architects, William G. Habersham and Pitt, 38, Bloomsbury-square, London; and on application to the clerk of works (Mr. Jones), at Duncrub-park, Dunning.

PRISONS.

KENT.—For certain works to be done at the county prisons, Maidstone, to form store-rooms, &c. Plans, &c., with Martin Bulmer, county surveyor, Maidstone. Sealed tenders, endorsed "Tender for Works at the County Prisons, Maidstone," are to be delivered to Mr. Bulmer, by four p.m., on the 27th inst., and persons tendering are to be in attendance at the Courts of Justice, Maidstone, at half-past twelve on the 28th February.

DWELLING HOUSES, &c.

LANCASHIRE.—For the erection of a dwelling-house, together with spacious business premises, proposed to be built in Lytham, Lancashire. Plans, &c., with Mr. S. Wartenberg, the Bazaar, Lytham. Tenders not later than 26th February.

WATERWORKS.

WELCHPOOL.—For laying and jointing about 6,500 yards of cast-iron pipes, and for providing and fixing sluice cocks, hydrants, and other works, for the Welchpool Waterworks. Specifications, &c., may be obtained of Messrs. Robert Dymond and Sons, surveyors, Exeter, at 10s. 6d. each. Tenders by March 10.

RAILWAY WORKS.

IRELAND.—For the execution of the work of the Letterkenny Railway (15 miles 5 furlongs). The line is set out and lockspitted, and the contract, drawings, and specification, may be seen on application to John Bower, Esq., the Company's engineer, 28, South Frederick-

street, Dublin. Tenders received until the 20th of February next, addressed to Alexander John Robert Stewart, Esq. (the Chairman of the Company), at the Office of John Storey, secretary, Letterkenny, County Donegal.

IRELAND.—For the construction of the works upon the Midland Counties and Shannon Junction Railway, between Clara and Banagher, and commencing at a point a mile and a half from the Junction of the Midland Great Western and Great Southern and Western Railway Companies, on to Banagher, a distance of about 17½ miles. Plans, specifications, quantities, &c., are to be seen with the engineers of the Company, John Hill, Esq., Tullamore, and Henry Brett, Esq., 8 Harrington-street, Dublin. Tenders to be sent in not later than the 8th March, at 12 o'clock noon, endorsed "Tender for Works," and addressed to J. Fowler Nicoll, secretary, offices of the Company, 53, Lower Dominick-street, Dublin.

COLENE VALLEY AND HALSTEAD RAILWAY.—For the erection of a booking-office, waiting-rooms, dwelling for station master, and offices in connexion therewith, at Halstead Station. Drawings, &c., at the offices of Mr. Watt, at the Railway Station, Halstead. Tenders before 12 noon, on the 24th inst., addressed to the Directors, at Halstead Station.

MILITARY WORKS.

LONDON DISTRICT.—For works and repairs at the undermentioned stations, separately or otherwise, from the 1st of April, 1862, to 31st March, 1863, inclusive, viz.—London, comprehending the Tower of London, all the barracks and other buildings within five miles of that place, and Turnham-green Militia Barracks; Croydon and Carshalton Barracks; Hounslow, Hampton Court, and Kneller Hall Barracks; and Richmond Militia Barracks; Windsor Cavalry and Infantry Barracks, and Belvedere Fort; Militia Barracks, Barnet; Militia Barracks, Hatfield; Militia Barracks, Uxbridge. Schedules and printed forms of tender, price 7s. 6d. each, and all necessary information, on application at the Royal Engineer Office, 11, James-street, Buckingham-gate, London, S.W. Sealed tenders will be received at the War Office, Pall Mall, London, S.W., addressed to the Director-General of Contracts, on or before the 21st of February, 1862.

WELL-SINKING.

DONCASTER.—For boring, to ascertain if water can be had by means of an artesian well, in the Borough of Doncaster. Tenders to state the cost per yard for the boring; the contractor to find all implements and plant. Mr. John Butterfield, No. 25, Horse-fair, Doncaster, will afford every information, and point out the site or sites of the intended work. Sealed tenders, with references, to the Mayor, Mansion House, Doncaster, on or before the 24th February.

HULL.—For the sinking a shaft and making a bore-hole at the Derringham Springs, and other works connected therewith. Plan, &c., with Thomas Dale, resident engineer, Engineer's Office, Stoneferry, Hull. Sealed tenders, addressed to the Chairman of the Water Committee, must be sent in to Robert Wells, Esq., the town clerk, not later than the 25th inst.

ROADMAKING, &c.

LIVERPOOL.—For executing the various works required in laying out and forming the Liverpool Cemetery, at Anfield Park, Walton, including the making of roads and walks, the levelling, shaping, trenching, and digging of the ground, the formation of drains, and other similar operations. Plans, &c., at the offices of the Board, No. 12, Clayton-square, Liverpool. Sealed tenders, addressed to the chairman of the Board, marked "Tender for Ground-work," must be delivered at the offices of the Board on or before the 19th inst.

IRELAND.—For the following works, in the barony of Goresy, in the county of Wexford:—1.—For making a new line of road from the corner of the Post-office in Goresy, to Edward Foley's cottage in Ballyraheen, containing about 415 perches; not to exceed £500. 2.—For making a new line of road from Goresy to Tinnahilly, containing about 300 perches, in the townland of Ballygarry. Plans, forms of tender, &c., obtained at the office of Henry E. Wynne, secretary to the Grand Jury, County Court House, Wexford.

SEWERAGE.

OXFORD.—For constructing an open sewer along a portion of the Trill Mill Stream in the city of Oxford. The drawings, &c., at the Commissioners' office, Town Hall, Oxford; or particulars obtained from Mr. John Galpin, surveyor. Tenders, on printed forms, which may be obtained either of the clerk or the surveyor to the Commissioners, must be delivered, sealed, to Frederick J. Morrell, clerk to the Commissioners, No. 4, St. Giles's-street, Oxford, on or before twelve noon, on 10th March, endorsed "Tender for Open Sewer."

SUPPLY, &c.

SWANSEA.—For the following contracts for the Swansea Local Board of Health. Contract No. 2.—For supplying cast-iron water-pipes, and other castings. Contract No. 3.—For supplying sluice valves, hydrants, and other steel fittings. Contract No. 4.—For laying and jointing cast-iron water-pipes, fixing sluice valves and hydrants, and for other works. Duplicate specifications, &c., on payment of £1 for each contract, on application at the office of the town-clerk, Guildhall, Swansea; or at the office of Robert Rawlinson, Esq., Civil Engineer, 34, Parliament-street, Westminster. Sealed tenders, endorsed, "Tender for Contract No. 2, 3, or 4," must be forwarded to the office of C. B. Mansfield, town clerk, Guildhall, Swansea, on or before the 25th Feb.

CLOCK TOWER.

WARRINGTON.—For the erection of a public clock tower on Trinity Church, Sankey-street, in the borough of Warrington. Drawings, &c., at the office of W. P. Coxen, C.E., Market-street, Warrington, to the 22nd inst., and tenders for the work must be left at the Town-hall, on the last-mentioned day, endorsed "Tender for Clock Tower," addressed under cover, to the Chairman of the General Purposes Committee.

BRIDGE.

BOLTON.—For the erection of a timber bridge across the river Irwell, at Agecroft-bridge. Plans and particulars at Mr. A. Pilling's, Contractor's office, Davenport-street, Bolton.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favor us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

H. J. JEN.—We give those subjects which we may deem suitable, and in such order as may seem to us desirable. Many other matters claim our attention.

R. Y.—So much depends on the nature of the work arranged for, that it would be impossible to give a fair decision without knowing more of the matter.

J. C. Y. (Leicester).—As soon as possible, the delay is not with us.

R. J. R.—Certainly not.

B. A.—Next week.

E. C. (Clapton).—Yes, both may be had of our publisher.

J. B. (Ipswich).—We have no time to teach engraving.

F. W.—Not suitable.

K.—v.—In type.

Mr. M.—Thanks; view shall be engraved.

Z. Z.—Shall appear when we receive name and address; it is our rule.

O. U. O.—A view is being drawn.

Messrs. A. and H.—Statement contains nothing new.

BART. MUS.—Too late.

A. T. B. A.—J. P. C.—Thanks.

A DIRECTOR.—We cannot assist.

M.—Shall hear from us.

St. PANCAS.—Below our mark.

A SUBSCRIBER FROM NO. 1.—Send sketch.

ADVERTISER.—Yes, if noteworthy.

NOTICE.

The Seventh Volume of the BUILDING NEWS is now ready, bound in cloth, price 21s.

Subscribers can have their copies bound, either with or without the advertisement pages, for 4s. 6d., on sending them to the office. Cases ready for binding the volume may be had price 2s. each.

* All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Bow-street, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 78 to 21, Old Bow-street. Advertisements are received up to six o'clock on Thursdays.

RECENT ACCIDENTS.

HAT with the fatal calamity at the Hartley Collieries, and the more recent accidents in the Waterloo-road and in the Amherst-road, Hackney, the public will have supped full of horrors. We have had hardly time to recover from one deplorable mishap before, in rapid succession, the sickening details of others meet our eyes in every newspaper. Life is crushed violently from the bodies of fellow-creatures, limbs are broken, human flesh frightfully lacerated, and, above all, looms the melancholy spectacle of homes broken up and made desolate by the loss of those props which heretofore sustained them. The most painful reflection which these sad catastrophes suggest is that they might, perhaps, all, with proper precautions, have been prevented. It can scarcely have escaped notice that they are all referable to one and the same cause—to a desire to work property cheaply—and that thoughtlessly, we honestly believe, men's lives have been risked, and, as it turns out, sacrificed, to insure large returns. An extra shaft to the collieries would have insured a safe retreat to the

entombed miners; good bricks and mortar, less haste, and more efficient supervision, would have made sound buildings instead of a ruinous heap in the Amherst-road; a compliance with the notice of Mr. North, the Lambeth Surveyor, would have made the grating in the Waterloo-road safer now than it has been for years past; and yet we cannot justly lay the deaths at the doors of the respective employers, for we should remember that they are but types of their several classes. The Hartley mine was not a solitary instance of work done with a single shaft. North, south, east and west of the metropolis buildings have been run up as quickly and as *economically* as those at Hackney. Wherever tenements are let and sublet there is always an evasion, as far as possible, of a landlord's duties. Further, this method of business is but another phase of the tradesmen's fraud which adulterates every morsel of our food, dilutes our drinks, falsifies our fabrics, shortens the length, and diminishes the number of twists in our "warranted" cotton. It is part and parcel of the great lie which encases our social life. By the aid of unlimited "competition" we have created the Frankenstein, and the monster's cold touch is ever startling us. He smirks and smiles behind every counter, he tints our elaborate and deceptive perspective views, he guesses at estimates, and wheedles committees. He copies pictures, buys them knowing them to be spurious, and then, with becoming gravity, dilates upon their genuine character. The employers of the unfortunate victims must, we believe, with natural retributive justice, suffer considerable pecuniary loss, to say nothing of other grief. He who is without sin of the same character may cast another stone at them. We would rather stretch out our hand in the hope of catching hold of some remedy for the evils of which they are the victims, and which have not yet put forth all their upas-leaves.

We may dismiss the colliery accident. It was of such magnitude as to insure Parliamentary provision against its recurrence.

The Waterloo-road calamity suggests one or two striking points for observation. It is admitted that the paving-stone and the iron railing were private property, and, consequently, that they were beyond the control of the vestry. The circumstance of their fall shows clearly their dilapidated and badly constructed state. The stone with a flaw in it was 5 feet 4 inches wide, and it had no supporting brick arch. It was simply let in to the wall of the house, and rested on the other side upon the pavement wall. The cause of the accident is apparent to every man of common sense, and the jury was not drawn off on a false scent by the insinuation that the broker's violence in breaking open a door dislocated the landing. Mr. North, the surveyor of Lambeth, appears, from his evidence, to have brought the dilapidated state of these gratings before the General Purposes Board between two and three years ago, and he believed notice was served on the landlord's agent to repair the landings by putting brick arches under them. Subsequently to that time he "called Mr. Legge's (the landlord's agent) attention to the matter," but still *nothing was done*. The landlord had, meanwhile, sublet the premises, and, we are informed by Mr. Jeffs, the sub-tenant, said nothing of this notice to repair. He, like other "business men," made the best bargain he could, and was not bound to proclaim the defects of the property. Now, in common fairness, we ask, do not such proceedings take place daily? Does not even law—we talk not of morality—side with the lessor, and proclaim that the lessee should

use his eyes when taking possession of property? Do not let us be too hard upon the revealed evader of moral obligation, when we should but acknowledge his shrewdness if no investigation had been needed into the whole of the circumstances attending it.

It appears to us that the real flaw which caused the accident is a little removed from the scene of it. In the first place, surveyors can only act when their "attention has been called" to a dangerous structure. They, who from practice are most likely to see defects and dangers, must wait until less expert men discover and complain of them. They may know of unsafe spots, but they must know them officially before they can report upon them; and this brings us to the second noteworthy fact, that a complaint of the state of this identical landing was received, and that a notice was served for its repairs, but, strangely, no one seems to have had authority to compel the defect to be made good. For two years and a half people have walked over this condemned landing, its state has been known, and yet neglect has been allowed to culminate in disaster. Surely a little extra power might wisely be conceded to the surveyors. We can, in future, dispense with their waiting to have their attention directed to dangers, and we might advantageously allow them to enforce compliance with their notices. Failing such compliance, they should have power to get the necessary work done and to recover the amount expended from the parties who disregard their notices. We believe that a simple enactment like this would do more to prevent future accidents of the kind than fifty expressions of opinion—unfortunately, too soon forgotten—by an inquest jury.

The accident which occurred at Hackney was, if we are to believe all the witnesses, something very mysterious. A portion of a range of "superior" houses, three stories high, and having shop fronts, which have been only just roofed in, and wherein the carpenters were laying the floors, suddenly fell, like a child's card-house, burying no less than twelve persons in the ruins. The foreman of the carpenters stated that there were bond-timbers of the usual size round the buildings of each house. The roof "was tied in a proper manner." He believed the mortar was "good." "The largest proportion of bricks used were 'stocky.'" Old bricks had been partially used, but they were sound. No story posts were put to the houses which fell. This witness attributed the accident to the frost having got into the work, and the mild weather coming suddenly afterwards had caused the wall to buckle out.

A plasterer, likewise in the employ of the builder, also bore testimony to the good quality of the mortar, and confirmed the statement of the carpenter as to the bricks. They were, "generally speaking, 'stocks,' but he *had* seen better." He likewise thought the frost "might" have something to do with the accident; and, also, that the trains passing along the line—fifty yards distant—"might" have something to do with it.

A third witness, also in the employ of the builder, attributed the accident to circumstances over which his master had no control. "The mortar was good, being formed of three parts sand to one of lime;" but added, as the sand had been lying there for a long time, no doubt other substances got mixed with it. A larger quantity of lime was mixed with it in consequence of the presence of this "foreign" material. The bricks were not of the best quality. As he agreed with the former witness that the bricks were inferior, we are at a loss to understand what he means by the *second-rate* being placed on the top of the walls. Does he wish to infer that the third and fourth rate ones were placed below, for no witness has hinted at the fact of first-rate bricks being used.

Henry Ketteridge, on the contrary, decidedly condemns the mortar; it "ought not to have been used in such buildings as these." Loam was mixed extensively with the sand. The bricks "*crumbled in his hand when he put them into his hod*." He gives us a clear insight into the nature of the work, when he tells us that the inferior mortar, made of the sweepings of old buildings, was used *at the back of the 4½-inch facings*. "The bad bricks were used for filling-in work." He further tells us that "the piers have been *cracked this last three weeks*." Another witness said, that "the bricks were of the worst description," and that "the mortar was of a very inferior sort."

Leaving the testimony of the workmen engaged, we come to that of the professional men.

Mr. Topham, civil engineer, decidedly condemned the materials; the mortar was "soft and loamy," part of the bricks "were very much over-buried." The "pier was not of sufficient strength." In his opinion "the accident was caused by the defective materials used in the buildings."

Mr. Tillitt, the surveyor, attributed the accident to the number of men on the work. His "practical experience" led him to believe that the bricks and mortar were of fair quality, and as a proof he brought forward the fact that the party-wall was still standing, but he admitted immediately afterwards that he had not much faith in his practical experience, for he did not think the wall sufficiently secure to go him-

self inside. Mortar made of the sweepings of the old houses is certainly a common article and frequently used, but we are certainly surprised to hear a surveyor of "large experience" approving of such work. Altogether, we think Mr. Tillitt might, advantageously for himself, have withheld his opinion on the matter. A gentleman who proclaims the security of a wall which he instinctively fears to approach, can scarcely be expected to have his "practical experience" of it valued.

The evidence of Mr. Ashpitel showed that the *outside* bricks and mortar were good. He believed the defective pier was the main cause of the accident, that the frost had contributed to it, and that the weight of men and materials was the moving cause.

Mr. Legge, the district surveyor, on the contrary, attributed the accident to the frost, the vibration, and the subsequent loading of the work whilst it was yet green.

There was a good deal of conflicting evidence brought forward, but the jury hit the truth in their finding. There can be no doubt that the materials were inferior, that there was inefficient supervision, and too much haste in the construction; but again we say buildings of this description are run up every day. Money is invested in them, and they are occupied.

Mr. Amos uttered the simple truth in saying that the materials were "suitable for buildings of the kind," by which he meant that they were such as were ordinarily used in buildings of that character—in buildings which have made the fortunes of the speculators who constructed them. It was a mere accident which caused these buildings to fall and others to stand, with their deceptive 4½-faced work successfully masking their rottenness. We are not inclined to be severe upon a man who, by a sudden lurch, has been thrown upon a rock, whilst others who have steered equally close rest at anchor uncensured. The blame is not with an individual, but with a system. Every outskirt of London is studded with buildings not only as bad but worse than these in the Amherst-road.

Again, if a speculating builder were to erect houses with materials of uniform good quality, he would get no advanced price in selling or letting them. If they *appear* good, it is sufficient for the discriminating public, who buys what is cheap to procure a large per centage on its investment. Even the mortgages, by Mr. Green's evidence, do not require specifications. All they require is, that the buildings be constructed according to the Act, and according to approved drawings, and that there is their money's worth on the ground. Mr. Legge, the district surveyor, even informed the jury that it was doubtful whether he had power under the Act to make any representation about the quality of the materials. The walls must be a certain thickness, but they may be built of place bricks or "sloughs," and "loamy mortar," without violating the Act, whilst a wall of the best possible materials would be condemned if it were found a trifle deficient in thickness. This is an anomaly which requires immediate rectification.

The only efficient provision which can be made against future accidents of this kind is to compel builders to submit a general specification, describing the quality of the materials, with the drawings, to the district surveyor, and to give him the same authority respecting it as he now possesses about the thickness of walls. This would insure good building to a sufficient extent, and in case of failure we should know upon whom the blame would rest. It would be in the end better for the speculating builder, because it would be a guarantee which he could produce to a future purchaser that the hidden portions of the building were what he represented them to be, and justify him in asking a proportionately larger sum for it. It would raise the reckless man to the more honourable level of the sturdy conscientious builder, and diminish considerably the risk—of necessity great—which all labouring men are exposed to.

THE BUILDERS' BALL.

THE Annual Ball in aid of the funds of the Builders' Benevolent Institution took place last night, at Willis's Rooms, King-street. It was numerously attended, and the company broke up at a late, or, more correctly, early hour.

PORTUNNA, IRELAND.—A mansion is about to be built at Portunna, Ireland, for the Marquis of Clanricarde, from designs by Sir Thomas Deane and Son, architects. The style adopted is French Gothic. In the main buildings are comprehended on the ground floor an extensive suite of apartments, together with grand hall and staircase, spacious corridors, &c., and on the upper floor are various bed, dressing, and bath rooms, &c. The building will cost £15,000.

GAS.—London housekeepers, who are paying 6s. per 1,000 cubic feet of gas, will be glad to hear that the recently-invented "water-gas" is likely to take the place of coal-gas. According to the *American Gas-Light Journal*, this gas, seventy-three parts of which are derived from water and twenty-seven from oil, at nine cents per gallon, is in all respects better than coal-gas, besides the advantage of being very much cheaper.

SIMMONS' GAS AND WATER CONNECTOR.

AT a meeting of the Metropolitan Association of Medical Officers of Health, on Saturday, February 15th, Simmons' Gas and Water Connector was introduced by Dr. Aldis, of St. George, Hanover-square. A specimen of the machine (here illustrated) was upon the table, attached to a circular piece of wood,

to represent a gas or water main pipe, whereby the action of the machine was pointed out. It was said that the number of accidents which happen from the present system of connecting the service-pipe to gas mains render it highly necessary that some method should be adopted of carrying out the work without risk either to the men engaged in it or to the adjoining property. The Connector has been patented. It is simple and compact in construction, and so easily adjusted that the most unskilful workman may thereby connect a piece of pipe to a gas or water main, charged with any amount of pressure, without escape of gas or water. The machine is screwed to the main pipe, and the drilling of the required hole commenced when the opening has been made into the main; the drill is partly withdrawn from the stuffing-box. The handle on the left side is pushed in, closing by the valve attached thereto all communication between the interior of the main and the stuffing-box. The drill being then removed, the top is inserted, and the valve is opened, so as to allow of the hole in the main being tapped. The tap is then withdrawn in the same manner as the drill was previously, and the connecting piece of pipe being inserted, the machine is removed.

Dr. Aldis proceeded to explain the working of the machine, the necessity for its general adoption, and the benefits which would result therefrom, as follows:—Its use would avert the risk of human life, as he could fairly testify, having seen it in operation in Herscherry-road, Westminster. The most expert workman could not attach a service pipe to the main without the escape of from 35 to 40 cubic feet of gas according to the calculation of a gas engineer, but by the means of the invention before them the escape of gas during the operation alluded to is almost imperceptible. One workman had been knocked down seven times in attaching service pipes, from the pernicious effects of the same escape of gas on the present objectionable system. The small stuffing box receives all the gas that escapes from the main whilst the connection is made, so that no injury is experienced by the workman.

Mr. Simmons, of New Palace-yard, the inventor, who was in attendance, observed that Dr. Aldis had been kind enough to explain the general principles of the Connector, and it only remained for him to give the details of its working; he then explained the details of his machine.

The Chairman observed that he thought it was very effective for the object in view. Dr. Gibbon moved "That the thanks of the Association be given to Mr. Simmons for his invention, and to Dr. Aldis for introducing it to the meeting. He (Dr. Gibbon) thought that it would be especially beneficial in the case of subways for gas and water pipes, because the escape of 40 or 50 feet of gas under such circumstances would be highly dangerous.

Dr. Randle observed that the principal opponents to the application of new inventions were found amongst the workmen themselves, though they were in cases like the present most interested in the success of them. The motion of the Chairman having been carried unanimously, Mr. Simmons remarked that the Chartered Gas Company had approved of his invention.

SOCIETY OF ARTS.

AT the weekly meeting, held in the Society's Rooms, on Wednesday evening, THOMAS SOPWITH, Esq., F.R.S., in the chair, the paper read was "On the Relative Merits of the different Systems of Working Metallic Mines and Collieries," by Mr. H. C. SALMON, F.G.S., F.C.S. The author remarked that among the mineral resources of Great Britain coal and iron occupy by far the most important position, their value having been, in 1860, nearly seven and a half times as great as that of the produce of all the metallic minerals put together. The values were—coal, twenty millions; and pig-iron, twelve and a half millions; while all the other metallic minerals only yielded about four and a half millions sterling. In comparing the systems of working collieries with those employed in metallic mines, it should be borne in mind that coal was usually found in nearly horizontal beds, while the lodes of metallic minerals were generally nearly vertical, the position of the former being pretty easily ascertained, while the latter were most irregular, and often difficult to find. The mere discovery of metallic lodes became, therefore, a point of the greatest importance in this class of mining, and the value of the minerals, when found, was so great, that economy in the mere mechanical arrangements for bringing them to the surface was often a matter of secondary importance; while in coal mines the primary object was the economical and safe removal of the largest possible portion of the coal. The systems of driving and winding were never likely to be so perfect in metallic mines as in collieries, and in many of the former the workmen were still obliged to ascend and descend as much as 300 fathoms by ladders—a most exhausting addition to their day's labour. The ventilation of metallic mines was usually a matter of little difficulty, while in collieries it required the utmost skill, and, even with all the appliances of modern engineering, was often found difficult to carry out effectually. The author described the various plans usually employed for this purpose, and concluded by arguing that much consideration should be shown to the managers of mines, lest, as they were, with many difficulties.

BRITISH INSTITUTION.

SEVERAL of our contemporaries indulge annually in attacks on this Institution, because there are not more pictures by Royal Academicians exhibited on the walls, and attribute the fault to *diletante* management. The answer is a very simple one; it is against the rules of the Royal Academy that any of its members should exhibit in any other public building than its own; and the rest of the profession say that as the members of that body have a right to exhibit eight pictures every year at the Royal Academy, with the privilege of indicating by numbers chalked on the back the precedence they wish to be observed by the hanging committee, it is not just that artists enjoying advantages so exclusive should occupy the principal places in a gallery so small as that possessed by the British Institution. It is true that Royal Academicians and Associates occasionally exhibit, but it is by sufferance from the council in Trafalgar-square, and with respect to the merit of their recent contributions their absence need cause very little regret.

The present exhibition, although presenting a large mass of good painting, is not, upon the whole, perhaps, quite equal to its immediate predecessor. The collection of last year possessed several landscape and small subjects, painted and designed in a style which indicated an incipient feeling for a most pleasing branch of art now practised with success by the French painters,—we mean a mode of treating subjects of little importance in themselves with an elegance and refinement giving them a classical air, which rendered them very pleasing. Pictures in that style, we regret to find, have nearly disappeared on the present occasion; and another failure in the collection is the want of a real “sensation picture.” No. 1 in the catalogue generally indicates the committee’s opinion in this respect, and the object of their selection is always placed over the fireplace in the north room, and there consequently is now to be seen “The Jury,” by Mr. J. Morgan. The twelve heads are well painted, varied in character and expression, and very amusing withal; but we think the individuality of each is so strongly marked, that if the idea suggested be followed out, we should desire to know who they are, and then when we were told and found that they were studies from the artist’s friends, who never were assembled together for any particular occasion, we should then feel the true value of the picture as a permanent work of art. This was the fault in a less degree to be found in Webster’s Village Choir, but it is not a censure which can be cast upon Hogarth’s Group of Country Musicians, nor his Laughing Audience. In all his heads there was quite enough of the reality to satisfy the mind, and not so much individual peculiarity as to induce a wandering of the mind beyond the subject for a satisfactory resting-place. This picture, therefore, although possessing the merits we have stated, falls short when looked upon as the means of communication between the mind of the artist and that of the observer. It is, besides, when studied in a thoughtful manner—not looked at cursorily—only half a subject, because we are not shown what it is that occupies the attention of “The Jury,” and produces so great a variety of expression. This may be said to be the case with Hogarth’s Laughing Audience, but in that they are all decidedly laughing in various degrees, and from habit we can more easily fancy what they are doing on the stage than in a court of law.

Near to this picture, a little to the right, is, for homely feeling, the best picture in the exhibition, entitled “The Return of the Runaway.” The figure of the stalwart young sailor is admirably drawn; there is a nice bit of sentiment conveyed by the red stripe on his shirt sleeve, showing that although a runaway from his parents he has behaved well at sea and been promoted by his superiors. The astonishment of the mother, overpowering for the moment the instinctive sense that it must be her son, is admirably expressed. The little granddaughter is realising with wonder the actual individual of whose doings at sea she has heard so much, and the old father looks up from his newspaper with a vacancy of expression indicating that, possessed by the subject he has been reading, he has not yet had time to receive a new impression. The perspective of the furniture in this humble interior is excellent, and the tone is skilfully subdued so as not to attract the eye and attention from a quiet contemplation of the subject. The tone of colour has been objected to, but, if it be a fault, it is a fault on the right side, and it must be remembered that pictures painted in subdued and “broken tints” always look better out of exhibitions. We must not forget to state that Mr. J. Clark is the painter of this excellent picture.

Still continuing to the right, we come to a large picture by Mr. J. Gilbert, entitled “Cardinal Wolsey and the Duke of Buckingham,” which occupies the centre of the east wall, and which locality reminiscence connects in our mind as the *pons asinorum* of this gallery. We remember several unfortunate attempts at historical painting by Sir G. Hayter, which have hung here, and more recently the seriously pictorial mistake called “The Sacrifice,” by Sir Edwin Landseer—the sticklers for pictures by R.A.’s must have forgotten that—and now we have as great a failure from Shakespeare’s play of Henry VIII. by that most daring of *bravura* painters, Mr. J. Gilbert. We have frequently admired the dashing manner in which he represents a group of warriors, and his “Interior of Rembrandt’s Studio,” which hung on the opposite wall last year, was not very deeply studied though it was pleasing. The present picture, which has some merit in the disposal of Wolsey’s retinue, and in the successful although sketchy execution of some of the figures, may be praised in those respects; but when we come to the principal characters in the scene, the faces are almost hideous in drawing and painting.

Mr. Lance exhibits several clever fruit pieces, and among them is a frame containing two subjects, which he calls “Force and Finish,” each of them executed in the style implied by the title; and, as he seems to invite selection, we decide on preferring “Force,” if we are to understand

by “Finish” that a piece of matting deserves more consideration and labour at the hands of the painter than a bunch of grapes.

In “Effic,” by Mr. Le Jeune, we object to the prevalence of red, which is greatly increased by the green at the back of the chair, which is, besides, spotty in arrangement from the fault of not being repeated and distributed in the other parts of the picture. The face, in a reflected light, is, however, very nicely managed.

“The Counterfeit Coin,” by Mr. W. H. Knight, is a very perfect specimen of this class of painting. A little girl has, we suppose, received a piece of bad money from an old woman who keeps a stall, and returns with her father, demanding that it shall be exchanged for a “good one.” The principal figures act with great energy, the pretended astonishment of the old woman is well contrasted with the genuine and earnest manner of the little girl. The picture is excellently grouped, and is as well coloured.

The “Quiet Dell,” by Mr. Robert Collinson, is an example of how a close study from nature may, by the application of the legitimate rules of art, be rendered worthy of being accepted as a perfect picture. The “Quiet Dell” is really, as regards subject, nothing more than an imitation of a few groups of wild vegetation, with a little sky and less water, and which, besides being a perfect work of art, is, to those who can appreciate that distinction, as desirable a possession as any in the gallery. Although this is evidently a close study from an accidental arrangement of nature, it displays the advantages which may be conferred on such a subject by its being presented to the æsthetic mind of an accomplished painter, instead of falling into the hands of one whom it is the fashion to call a “conscientious and loving” adorer of the reality, who pretends to paint more than he can see, and spoils all he attempts to paint; who labours to depict all he knows to be there for the sake of truth, and perpetrates falsehood in persevering, and laborious and superfluous detail. In the little picture before us the principal masses of the composition are a group of dock leaves, a group of wild plants, of which we do not know the names, but differing in form and colour, and the third mass consists, in its leading points, of white flowers; these are brought as closely as possible in contrast with the darkest part of the picture, including a dark pool of water, which gives tone and accent to the general effect, while the other two masses are separated by portions of tangled grass and other weeds slightly indicated, contrasting with the decided forms of the leading features in the principal groups, while repose and relief are obtained by parts of the bank on which the vegetation grows being seen, and still more by the tranquil sky, which, serving as a background, and having some clouds indicated near the edge of the frame, repeats the idea of the more numerous forms below, thus bringing the two extremes—the sky and foreground—of the picture into unity. The general tone, as regards colour, is obtained by the rather delicate green of the dock leaves, slightly above nature. This is contrasted by the dark grey of the pool, and the masses of grass are relieved and heightened by the vivid red of some poppies. The keynote of the harmonious chord, therefore, is the positive red of the poppies, and its complementary tones will be found in the cool colour of the water and the yellow in the green of the general foliage. The red of the poppies being more prominent than any other tint, is more distinctly repeated and distributed by the red-flowered plants in the second group. The introduction of a wild duck in the gloom of the shade is judicious, as giving life and motion, but is still more valuable as a sentiment, suggesting, at the same time, the absolute quietude of so sequestered a spot. We have no wish to be over critical with so excellent a picture, but we noticed that the painting of two of the largest dock leaves in the foreground presented two dark spots of equal size and intensity, which, as the French critics say, “make holes,” and that the glazing of the small portion of the earth beneath them was too rich to be in harmony with the rest of the composition. These objections may, however, be easily removed by a little opaque colour being rubbed with the finger over one of the dark spots, and over part of the ground nearest to the principal leaves, and partly wiped off again, which will make this picture a desirable acquisition to any collection, notwithstanding the humble nature of its subject.

It is to be regretted that Mr. Lucas has not adopted a tone of colour more consistent with such a picture as that he exhibits under the title of “The Children of the Heath.” A subject so simple requires a more general and transparent mode of treatment than a solid, cool, and grave one, more suited to sculpture. We can at all times appreciate a conventional scale of colour, when it will enhance the sentiment of the scene, but one so æsthetic and below the reality, is certainly not in unity with two little girls gathering flowers on a heath. The younger girl is, however, very interesting in character, and is both largely drawn and painted, and was no doubt the inducement to paint the picture; but the other one, kneeling down and plucking the flowers, is extremely hard, poor and inartistic. “Shylock’s charge to Jessica,” by Mr. W. Holyoake, gained the prize, we believe, for painting at the Royal Academy. There is considerable talent displayed in it. The face of the Jew is earnest in its expression, but wants tone and breadth of character, and Jessica, whose dress is well but too prominently painted, is devoid of interest; the attitude and figure of Lancelot is, however, easy and well-drawn.

A scene from Bulwer’s Last Days of Pompeii, by Mr. J. Colby, deserves mention, for the consistent and classical style in which the figures are drawn, and the generally well-sustained character of the whole picture—reminding us of the school of David. He also deserves praise for undertaking a subject for which so little patronage is to be met with at the present day.

The landscapes are, as usual, rather numerous; those by Mr. Willi

Dawson and Lee Bridell, are very good. Mr. Lance retains his position as our first fruit and flower painter. Miss Stannard, we think, shows improvement this year; her compositions show that she can think for herself, and her works consequently display more originality than any others treating similar subjects. Mr. Horlor's calves are broadly painted, but suggest Sir E. Landseer more than we like, because where so much original talent exists, imitation of others painters is as unnecessary as it is injurious to the position of the artist. Taking the exhibition as a whole, if it does not manifest any advance in art, it at all events may be found to possess the ordinary degree of attraction.

ST. THOMAS'S HOSPITAL.

A MEMORIAL has been addressed by the Medical and Surgical Officers and Lecturers of St. Thomas's Hospital to the President, Treasurer, Grand Committee, and other Governors of the Institution.

The memorialists refer with pride to the history of the establishment which is to be displaced. "Not merely from three centuries ago, when King Edward VI. enriched it, but from more than six centuries, St. Thomas's Hospital, standing on its present site, has been a source of incalculable good to the suffering poor of the neighbourhood, of the metropolis, and of the nation. The vast direct services which it has rendered to the sick treated within its walls, are not the only benefits which it has conferred on mankind."

They cannot without deep concern be aware, "that the present time-honoured edifice is to be made way for other establishments; that a new St. Thomas's Hospital is to be raised in some yet undetermined place; that, where the new Hospital shall stand, and on what plan and scale it shall be constructed, are issues which the Governors now have open for decision."

It is felt that, in the impending change, there is a singular and splendid opportunity for increasing the usefulness of the Institution, that the Hospital may be made the very first hospital, and the school the very first school, in England. Knowing that, since the beginning of the present century, the income of the Hospital has (mainly through the falling in of leases) increased from about £12,000 to about £32,000 per annum; knowing that further increase at the same rate is still in constant progress, and that soon the annual income of the Hospital must be very largely in excess of the present scale of expenditure, the memorialists are glad to believe that, within reasonable limits, considerations of cost will not be an obstacle to the desired result.

On the other hand, the occasion has its dangers. The course which must now very speedily be decided upon, will be one from which there can be no return. If, unhappily, any considerable error were made in the placing or planning of the new Hospital, the consequences of that error would remain for many generations beyond remedy.

Especially the intentions of the founders and benefactors of the charity would be almost irreparably defeated, and the priceless public boon of a great school of medical and surgical science would at the same time be sacrificed, if the new Hospital were to be planted in any locality where physicians and surgeons of high metropolitan standing could not be expected to serve it with assiduous attention, or where masses of the labouring population would not have easy access to it for the relief of all their emergencies of sudden illness and injury.

It is also felt that it is of paramount importance that everything possible should be done to insure a free and full discussion of the important issues which will be raised. And it seems to the memorialists that this object cannot be attained unless the several issues are made public for some reasonable time before the day when the General Court of Governors will have to decide on them.

With this view, they beg leave to express to the Governors their unanimous and earnest hope that when the Grand Committee reports to the Governors on the several tenders which shall have been made of land for the site of the new Hospital, the Governors, before deciding on the choice of a site, will cause the report of the Committee to be printed and published, and will then allow an interval of at least a month to elapse, during which the merits of the respective proposals may be open to public criticism; and similarly that when the Governors have it in view to determine on what plan the new Hospital shall be built, they will, for at least a month before they purpose to decide this question, permit public exhibition to be made of all plans which shall have been proposed for their acceptance.

The most conflicting rumours are abroad as to what the Governors really propose to do. Among other *on dits*, it is said that the capabilities of certain hospital lands north of the Thames are being tested with a view to the erection of the Hospital thereon.

MACHINE FOR TUNNELLING THE ALPS.—An ingenious and elaborate piece of mechanism has just been completed by the firm of Hawks, Crawshaw, and Co., and in a short time it will be tested at the Claxton Quarry, on the Sunderland-road, where it now is. This curious machine was originally intended to be employed in undermining Sebastopol, for the purpose of blowing up that city during the Crimean war, when our army were melting away like snow in the trenches before its almost impregnable walls. The engine for propelling the cutting machine resembles a locomotive engine, and is mounted on very low wheels. It has no funnel on the top, on account of the limited height of the tunnel; the steam will be emitted at one end. The cutting machine, to which the engine will be attached, resembles a large wheel, and a double row of teeth of the finest steel are arranged on what may be termed the spokes of this wheel. The knives of the machine are placed against the rock intended to be cut, and the wheel revolves and is pressed forward at the same time against the rock, cutting a large circular hole. A series of iron rakes are also attached to the machine, for removing the fragments of the rock cut out by the knives. We understand new machines for cutting the great tunnel through the Alps were successfully tried at Modane some time ago; and doubtless the machine manufactured by Hawks, Crawshaw, and Co. will be employed in the same great undertaking. The length of the tunnel already cut is 1,680 metres, of which 738 are on the French side, and 950 on the Italian side.—*Newcastle Daily Express*.

DUBLIN.—Workmen and labourers are rapidly clearing the ground in the vicinity of the Four Courts for the erection of the new record buildings, law offices, and Probate Court. The foundations of a commodious Court of Probate are now in process of being laid.

FEMALE SCHOOL OF ART.

THIS offshoot of the Science and Art Department at South Kensington, which has now found a home in Queen-square, Bloomsbury, deserves at every stage of its development the warmest recognition and support. In order that eligible students may have the benefit of a continued course of advanced instruction, they may compete for admission to the Training School at South Kensington, with an allowance of from five to fifteen shillings a week. Medals are annually awarded by the Government inspector; and the drawings submitted in competition for these prizes were exhibited on Friday and Saturday at the house in Queen-square, whither the school has been removed from Gower-street. Of the twenty-nine productions which have gained medals, twelve have been chosen to be sent in competition for the national medals distributed among all the schools of art throughout the United Kingdom.

Several of the works displayed on this occasion give evidence of an advanced state of student-power in the Female School of Art. Design for the purposes of useful art is not neglected, and it is in this particular branch that the school should be encouraged. Wood-engraving, too, is taken in hand, after having been dropped at South Kensington. In a frame of vignettes there is a miniature drawing of a pattern for Honiton lace, which has been commanded by her Majesty as an intended feature of the International Exhibition. The full-size design itself is also shown.

STRENGTH OF THE EXHIBITION BUILDING.

THE following report has been addressed to her Majesty's Commissioners by the professional members of the Building Committee of the International Exhibition:—

To the Commissioners of the International Exhibition.

My Lords and Gentlemen,—Feeling that it would be a source of satisfaction to the Commissioners, as well as to ourselves, as members of the Building Committee, and also a due precaution for the public safety, that the gallery and other floors of the International Exhibition Building at South Kensington should be thoroughly proved, we undertook a series of experiments on Monday last.

We have to report that, in carrying out these experiments, the various floors and stairs were put to a more severe test than they would be subjected to with the largest number of people that could possibly be assembled upon them at any other time during the Exhibition. The result of these experiments fully bear out our calculations on the strength of the different parts of the structure, and we feel perfectly satisfied as to the stability of the building for the purpose for which it was intended.

The two large domes, in the strength of which we have taken great interest, were eased from their temporary support last week, and no observable settlement took place.

The following are the particulars of the tests:—The first caused a large body of men, about 400 in number, to be closely packed upon a space 25 feet by 25 feet, on one lay of flooring; we then moved them in step, and afterwards made them run over the different galleries and down each staircase; at the same time we caused the deflections of the girders carrying these floors to be carefully noted at several places, and had the satisfaction of finding that, in each case, the deflections were very nearly the same, thus exhibiting a remarkable uniformity in the construction. The cast-iron girders, with 25 feet bearings, deflected only one-eighth of an inch at the centre, and the timber-trussed beams of the same bearing placed between these girders deflected half-an-inch at the centre. In every instance the girders and trusses recovered their original position immediately on the removal of the load.

We are, my Lords and Gentlemen, yours faithfully,
WM. FAIRBAIN, C.E.
WILLIAM BAKER, C.E.

THAMES EMBANKMENT AND RAILWAY. SOUTH SIDE.

YESTERDAY the Commissioners appointed by the Crown to inquire into and report to Parliament on this question met at the offices of the Commission in Victoria-street, Major-General JEBB, in the absence of the Right Hon. the Lord Mayor, in the chair. There were present Captain Galton, R.E., Commander Burstal, Mr. J. Thwaites, Chairman of the Metropolitan Board of Works, Mr. McLean, C.E., and Mr. Henry Kingseote.

Mr. H. H. Bird, C.E., of Robert-street, Adelphi, described a plan for an embankment on the south side, from Nine-elms to Southwark-bridge, solid, with trifling exceptions, to be constructed in the form of a river wall, with floating docks on the inner side, with access by openings in the wall. A public road would run on the top of the river wall from Lambeth Palace to Blackfriars-bridge, between 40 and 50 feet wide. There would be approaches at various places from the new road to the shore, with sluices for flushing the docks, at an estimated cost of £469,000. It was proposed that a body of river police should regulate the docks. The embankment would greatly improve the navigation, protect Lambeth from the overflowing of the tide, increase the public facilities for transit, and accommodate the densely-populated districts of South London.

Mr. HARTLEY, merchant, of Earl-street, Westminster, proposed embankments both on the northern and southern side, with a road and four lines of railway, and on the south a canal between the embankment and the shore from London-bridge to Battersea, into which the craft would pass through locks, the stream being dammed up at Battersea, and the current of the river thereby checked. The embankment on the south side would be 170 feet wide, with warehouses and residences, and on the north boulevards and gardens. The cost of the entire undertaking would be about five millions sterling, and he proposed to employ 5,000 sappers and miners in the construction of the work. As compared with the Seine and other European rivers, the Thames was a disgrace to a civilised country.

Mr. T. MORRIS, architect, proposed a causeway, 70 feet wide, on piers 100 feet apart, between Nine-elms and Bankside, Southwark, level with the bridges, at an estimated cost of £500,000.

The Commissioners then adjourned.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

RELICS OF EASTERN ARCHITECTURE.*

AMONG the many popular delusions which certain politicians sedulously cultivate, either from ignorance or less creditable motives, there are none more pernicious or less true than that in the East there is no progress, and that civilisation in the land of its birth is brought to a standstill. In far-off Orient life may not be so "fast," and men may not "go the pace" as in the remoter West; but the absence of go-aheadism is not proof that men and things stand still, feeding on the memories of the past and careless of the future. That there is progress in the East, though at a jog-trot pace, no better evidence can be afforded than by the notes of travel of Miss Beaufort. Two maiden sisters wandered through the East, lived in the desert, camped out with Arabs, "assisted" at the outbreak of a civil war, and went their way in the true spirit of feminine curiosity, without inconvenience and without impediment. Their two only grievances arose from the chilling indifference of English ladies, when the wandering maidens, by the fire of their Nile boat, lost their wardrobes.

" * * Much linen, lace, and several pair
Of stockings, slippers, brushes, combs, complete
With other articles of ladies' fair,
To keep them beautiful or leave them neat."

That they were not reduced to the condition of Eve in her original ignorance, and left *simplex munditiis*, was owing to the generous sympathy of the ruder sex; for one lady to whom the loss of their wardrobes was made known magnanimously contributed to their outfit "the gift of one book and eye!"—(Vol. i. p. 74). The other grievance was the neglect they experienced from H.B.M. Consul-General at Beyrout, Nevins Moore, Esq. When the first fight between the Druses and Maronites occurred Miss Beaufort and her sister were living in Beit Mery, the scene of action. "The various consuls had each one sent up horses and mules to bring down their respective countrymen, protected by their own janissaries. The English Consul had, however, sent up no one. We had brought several letters of introduction to the Consul, but during our stay in the town he had never called." Oh! Consul-General, is this your gallantry to two unprotected females on their travels? Grievances worse than these would not be the result of a journey to the Crystal Palace or to Epsom, when Londoners are holiday making; and sure are we that not in France, still less in England, would wandering maidens, who insisted on being introduced to the wife and family of every man they met, have so large a charter accorded to them, be granted such license, and enjoy such freedom from offensive proceedings, as had Miss Beaufort and her sister. The progress of the East in this respect leaves England and France, the leaders of Western civilisation, "nowhere." Contrast the ease and security with which these ladies journeyed to and fro with the fate of an officer of Engineers, who attempted a tour of Egypt just half a century ago. Poor Berrington started from Malta, with books, instruments, and letters of introduction to Mohammed Ali. He was shipwrecked before landing at Alexandria; crossing the desert, with a caravan from Cairo to Suez, he was robbed of his provisions and almost starved; he was compelled to sleep in a tent occupied by plague patients, two of whom died during the night. At Suez he was beset by further difficulties, and obliged to return by the next caravan to Cairo; he was overtaken by the simoom, which killed many of his fellow travellers; and at Cairo he found the plague raging, which fastened on him and slew him at Zante, as he was making his way back to Malta. Now Cairo is as free from plague as London, and Shepherd's Hotel is almost as luxurious as Meurice's, and certainly much cheaper. Suez is the Holyhead of the London and Bombay line, and there is no more danger of starving on the journey through the desert than there is while crossing Chatmoss. Is not this progress? Why, under the shadow of Palmyra, in the midst of Arabs who carry their lives in their hands, Occidentals have been known to exchange lovers' vows with as much security as if they were on a picnic to Hampton Court, not thinking it worth while to ascertain if the mash'lah by their side covered a slumbering Arab or a dozing European.

It is a melancholy reproach to our thirst for knowledge or spirit of inquiry that the researches of Western savans and travellers have proved more destructive to the monumental achievements of former ages than centuries of neglect and of Oriental vandalism. Since Napoleon's invasion of the East, down to the appearance of the latest importation from beyond the Atlantic, in the shape of a Yankee note of interrogation, transformed for the time being into a lotus eater, the East has been ruthlessly pillaged to stock museums or furnish mementoes of travel. A few years ago the present Earl of Aberdeen—how unlike the "travelled Thane!"—induced the Pasha of Egypt to clear out the famous rock temple of Abû Simbil, in order that he might behold its glories; but, with an indifference or contempt for the diffusion of art-knowledge, and a positive unkindness to those who were to come after him, the noble lord omitted to ask that the temple might be kept clear. Consequently, as soon as his curiosity was gratified, the fellahs threw the sand back again, so that the mysterious glories of the interior can be but imperfectly and with difficulty discerned, and yet the works which Belzoni and Lord Haddo have been the only Europeans, perhaps, to behold entire, must be well worthy of examination by more critical eyes.

The light which passes through the small opening enabled us to distinguish the features of that far-famed hall, which sinks deeper and deeper into the heart the longer you behold it. Four colossal figures stand at each side of the middle aisle as pillars, dividing off the narrow and dark recesses behind them; all the light there is falls on these eight Ramesses, now become Osiris, imbued with his almost superhuman strength and majesty and divine calmness, the swathed legs and the unearthly repose of the face bespeaking the god of death as the crook, and the knotted scourge portray the god of judgment.

Besides this hall, there are fourteen chambers in the temple, all perfectly dark, of course, though before the sand had choked up the entrance, the four small figures which sit on an altar at the farthest end of the adytum facing the door, must have been dimly illuminated by the setting sun (the temple faces the east), and they must have appeared to look with their stony eyes along the whole length of the temple and across the sacred ever-flowing Nile, to the steep purple overhanging mountains beyond its green banks. On the walls of the outer hall are represented the historic deeds and conquests of the great Ramesses; the other chambers are also sculptured all over, and two or three of them have a stone divan extending along the sides, but the pictures are so blackened with smoke as to be very difficult to decipher. Of the four colossal figures of the facade three only are quite uncovered by the sand, and one of these has been destroyed to the waist, while of the fourth only the face is visible. These enormous figures—they are 66 feet in height without the pedestals—are of the great Ramesses II. seated on his throne; his posture, the hands on the knees, signifying his rest after many conquests. Till I saw these figures I never could believe that features of such gigantic size could express such grace and benevolence so sweetly and grandly mingled.

When Gerard de Nerval swung out his exhausted frame under a leaden cheerless sky, and in a den of infamy, he had been dreaming of the East, of its glories and its mysteries, and he leaped into eternity wearied of our civilisation. How different was his jealous love for oriental art from that of an American, who, the authoress relates, pulled down the alabaster slabs lining a temple, that he might select the *moreaux* to be broken off for convenient carriage to his museum. Was it Mr. Seward, who about the time referred to was travelling in the East? There is an evident psychological relationship between the conception of such an act and the device of the stone fleet to blockade Charleston. French members of the Académie des Inscriptions have blasted down portions of structures, to save the exertion of climbing for the purposes of inspection. Recently, the French army defaced a rock tablet at the mouth of the Dog river, commemorating the passage of an Assyrian army, to afford a surface for the incision of a French inscription, glorifying the Emperor, the French General in command, and the troops. A couple of young English travellers did their best to deface the French profanation, and so created an occasion for Mr. Nevins Moore to exercise his diplomatic skill, as usual fruitlessly and without credit. The ruins of Ba'albeck are degraded by incised and painted names of the celebrities and many an *outs* who have visited the spot. Arabs break down columns for the sake of the clamping irons. Part of Palmyra is invisible from the fellahs having built their hovels amid the ruins, while the convulsions of nature now and then help the work of destruction. If the reader be curious to realise what the world has lost, let him compare the drawings of Wood and Dawkins of Ba'albeck with those made a century later by Roberts.

What Cairo is now, we all know, if not from actual inspection of the town, at least, by the overland mail. Yet, according to Henry Blount, who travelled in Egypt in 1634, the number of churches and mosques then amounted to 35,000, the noted streets to 24,000, some of which he found two miles long. The extent of the city, he reported, was thirty-five or forty miles in circuit. Allowing for travellers' embellishments, the city was evidently much larger than it now is, and there is too good reason to fear that the contraction of its limits has destroyed structures and works of art that would be priceless now for architectural and ethnological purposes. When the Hindu Sipahis penetrated into Egypt by the Red Sea to join the army of Lord Hutchinson, they imagined they had found at Denderah the temples of their faith, and of a cognate race. They were exceedingly wrath with the Egyptians for the neglect of their gods, and they performed their devotions in the temples with all the ceremonies practised in India. Yet the Temple of Denderah is of comparatively recent date, quite a modern antique, according to Miss Beaufort, who writes:—

It loses all interest of detail after the temples and tombs of Thebes, the hieroglyphics broadly testifying their modern age by their poorness of outline and bad arrangement; its nearly perfect preservation, however, renders it a good explanation, in its plan and general construction, for the more ruined but more perfect temples farther on; the great square court succeeding the pylons usual in the larger temples is here wanting; but the magnificent portico makes up for the loss. This portico, leading to the fine hall and lofty adytum within, has scarcely even a chip on the stone; it is supported by twenty-four grand columns with square capitals, to which the colossal face of Althor is affixed on each side; very sweet and dignified is the head, however singular the adaptation of a small pylon, which is inserted below the abacus as her head-dress; the whole front is richly covered with hieroglyphics.

But Egypt is now "used up" by our Sir Charles Coldstream; its mysterious glories are twice told; and, if we would essay "pastures new," we must follow the wandering maidens to Syria and Palestine.*

LAMBETH BRIDGE.

AT the half-yearly meeting of the shareholders, held on the 13th inst., the Directors reported *inter alia* that they had "arranged with the London Gaslight Company to lay down two mains of 18 inches diameter, which has required an increase in the strength of the structure, for which your Company receive a payment of £3,000, with the advantage of the bridge being lighted free of cost."

Mr. Barlow, the engineer, reports that the cylinders of the Lambeth pier are complete to the level of high water, and have each been tested with 400 tons of iron. The cylinders of the Westminster pier are in process of sinking, and will be ready for testing in less than three weeks. The experience of these operations confirms the undeniable economy and safety of the system of cylinder foundations. The abutments on both sides of the river are progressing rapidly. On the superstructure Messrs. Newall are about to construct a temporary building on the Company's property on the Lambeth side for the manufacture of the cables, and they expect that the cables will be complete by the 15th March. The ironwork is in progress at the works of Messrs. Porter and Co., and a portion has been already delivered. It is considered due to Messrs. Porter and Co. to state that their work has been executed in a highly satisfactory manner. If the rate of progress during the last two months be continued, the bridge will be opened in May.

* To be continued.

* "Egyptian Sepulchres and Syrian Shrines." By EMILY A. BEAUFORT. Longmans, London.

MR. SMIRKE'S LECTURES ON ARCHITECTURE AT THE ROYAL ACADEMY.—LECTURE IV.

WE have hitherto, this season, been engaged in discussing various, and, truth to say, somewhat miscellaneous subjects connected with architecture, suggested by a reference to some of the literary treasures contained in two public libraries. I have but dipped, very cursorily and superficially, into those collections. Much profit might, no doubt, be derived from the prosecution of a deeper, closer, and more systematic examination of them; but I do not consider myself justified in pursuing the inquiry farther, at least for the present, so brief is my appointed course that it is now quite time I should quit the mere literature of our subject, and proceed at once to the consideration of the principles that should regulate the practice of the art.

We must remember that architecture is strictly a practical art; far more so than either of the sister arts of painting and sculpture.

Reading and thinking are, no doubt, processes well adapted to clear up and make straight the path before us; they enable us to see our way, and understand the course we should take; but it behoves us also to accustom our minds to the carrying out of the principles so acquired. We may learn much of a country by studying geographical treatises, but it is as a wayfarer on its actual roads that we best become acquainted with it.

Let us, then, enter upon a detailed and practical consideration of the art of architectural design. Such a consideration seems naturally to divide itself into two very distinct general heads, namely, design as it affects exterior architecture, and design as it affects interior architecture; each being very different from the other in its aim and object. It would, however, be a serious error to suppose that the exterior and interior of a building should not be designed strictly in relation to each other. I hold it to be a serious defect in design to so shape the exterior of a building as not to convey to the mind of one viewing it at least some general idea of the form, and, when possible, even of the general arrangement of its interior. Still the treatment and the nature of the effects and impressions to be produced must necessarily be so different that I think it will be very convenient and proper to regard these two subjects distinctly and separately.

Let us, then, devote this evening to the consideration of the principles of design as they affect the exterior form of a building, and next week we will deal with the interior.

I need not insist on the paramount importance to an architect of a careful study of external architecture. There are few considerations that lead our mind so forcibly to a sense of the importance of a right cultivation of our art as the consideration of the permanence and durability of her works. Fifteen generations of men have passed away since the erection of those buildings which date from the decadence of mediæval art, and there are buildings still surviving the wreck of time since the erection of which a hundred generations have passed away. How grave a responsibility, then, it is which the architect takes upon himself! If his work be one of ordinary solidity, he must count upon a succession of critics, and be prepared to submit his handiwork to a varying standard of taste, varying to an extent that can scarcely fall to the lot of either of the sister arts. The sculptor's labour is bestowed on objects of comparatively little magnitude, and their defects as well as their beauties have to be searched out in order to be appreciated, or even observed. The painter's field of labour is, perhaps, still more limited and still less conspicuous; and it is painful to contemplate the perishable nature of the productions of his genius. All the love and reverence with which a picture may be regarded can but prolong its existence through a few centuries, and all the care with which it may be cherished may be thwarted and set at naught by an imperceptible worm, a careless spark, or even a neglected window-blind!

Again, if the hand of a master have failed the painter in the execution of his task, or should he, by one of those caprices from which even the highest genius is not always exempt, have produced a work with which, on after-reflection or on further study, he feels himself dissatisfied, he can turn his picture to the wall, or even paint it out. Not so the votaries of architecture. To them alone is it given to occupy the highways and public places, and perpetuate their glory or their disgrace in monuments which are at once conspicuous and durable. Is there any consideration better calculated than this to make us earnest, diligent, and studious? Is there any consideration more powerful to warn us from an indulgence in foolish excesses, or puerile capriciousness, or to induce us to proceed with a measured and a cautious step? To see that every line is founded on sound reason and just calculations? This is a duty which we owe alike to ourselves, to our patrons, and to our art. Let us seeking after present, but very evanescent, praise render us unmindful that our work, however crudely considered or hastily conceived, stands, and will stand, exposed to the unsparring judgment of successive generations.

It is obvious, then, that the composition of external architecture is of the utmost importance to the character of the architect, and demands, therefore, his first and most earnest attention.

Now, in the mechanical construction of a building, what consideration may be regarded as the most important of all? Undoubtedly its foundations. Let your superstructure be ever so just in its proportions, or beautiful in its decorations, if its foundations be faulty the architect can gather no laurels; the structure may drag on its unseemly existence for years, but it can win for him no applause. Nor is this regard to the foundations a mere consideration of mechanical construction; it is also a question of æsthetics.

If your basement be plainly adequate to the superstructure, if it be of fitting character and of competent proportions, you will have gone far to secure a successful result for your whole design.

I believe that in the kindred arts all masters agree in regarding the pose of a figure, or of a statue, a subject of essential importance; and I believe it to be a fundamental rule that the feet should be readily traceable, that there should be no doubt in the mind of a spectator as to how, or upon what, the human body is supported; and, of course, the eye demands that the footing shall be adequate to its task.

So, also, is it in our art. The eye must be satisfied that a building has a firm, visible, and competent basis.

Sir J. Reynolds compares the background of a picture to the base of a building; the comparison is certainly felicitous, and conveys an important lesson both to the painter and to the architect. Each should be quiet and solid, not forcibly obtruding itself upon the notice of the observer, in the one case by any inordinate brightness and glitter, nor in the other case by any needless multiplication of parts or obtrusive enrichment. Like the setting of a gem, the background of a picture may greatly enhance the effect of the subject, or seriously detract from it, according to the degree of judgment exercised in its treatment. So may great value be given to the superstructure of a building, by the judicious treatment of its base. But, besides these æsthetic considerations, there appears to be a peculiar practical propriety in giving to a building a base obviously competent to receive and support it. It is not enough to surmise, or presume, that a building has an adequate foundation; it is not enough even to know, as a practical man, that a building has an adequate foundation; the eye needs to be satisfied as well as the mind; the fact should be patent and palpable; otherwise a sort of uneasiness is produced on the mind of the observer, which it is the duty of true art to avoid; for it is one of the most legitimate ends of all art to yield pleasure, not pain, to the intelligent observer.

I need scarcely remind you of the elaborate attention paid to this especial subject by the accomplished architects of ancient Greece. Confined as the Greek temple ordinarily was within its *temenos* or sacred enclosure, and, therefore having its facade fully seen only from a point of view somewhat near, no very lofty substructure was necessary in order to give it dignity; but that the Greeks were fully sensible of the value of an adequate base, and of the importance of giving a due elevation and spread to the visible footing of a building, is manifest in all their works that remain to us.

The graduated plinths are a peculiar characteristic of most, I believe, of all of their temples, and seem to give great propriety and significance to the term "*Nascentia templa*," used by Martial. The spreading steps of a temple seem truly to link the structure with the earth it rests upon, and thus the building may well be, figuratively, said to grow out of it.

Instances are not wanting of casual irregularities of site having been made subservient to the production of very noble substructures.

It is true our knowledge of Greek exterior architecture is mainly derived from sacred edifices; but so attached were they apparently to the type presented by the temples, that they were satisfied to build their basilicas externally in conformity with it. The Basilica

at Pæstum, for example, has its substructure perfectly similar to the temples adjacent to it. The tombs in Lycia, with which of late years we have become familiar, are remarkable for the character of stability and permanence given to them by their bases.

Generally, we may with truth say that the remnants of Greek art which survive for our instruction are amply sufficient to prove that the refined eye of Greek artists failed not to recognise the æsthetic importance of a competent substructure.

In Roman buildings the general use of a podium is an evident recognition of the same feeling. Vitruvius treats the podium as an important, if not essential, feature in the composition of an order, and he gives us the proportions that were held in his day to be proper for this member.

The interruption of the podium of a colonnade, and the forming a break in it under each column, naturally led to the suggestion of the pedestal, which eventually became an integral part of every order. This pedestal may be regarded as a strictly Roman feature, nor am I aware of a single purely Greek example; the nearest approach to it being at the singular temple at Segesta, where the breaking of the upper plinth or step on which the columns stood, forms under each column a cubical block of masonry resembling a plinth; but even this, there is reason to believe, is rather due to the unfinished state of the building than to design.

When once adopted in the architecture of Rome, the pedestal became well-nigh universal, and continued as long as Classic architecture retained any of its ancient purity. In the grand style of Roman art, that art which it has been too much the fashion, both of the ultra Greek on the one hand, and of the ultra Goth on the other, to contemn, but which was an art, in its best days, most impressively marked by the greatness of manner which well became the masters of this civilised world,—in that art nothing is more striking than the skill shown in the advantageous placing of their buildings. The eye of the artist is everywhere apparent, when we examine the topography of ancient Rome, whilst the Villa of Mæcenas, the Temple at Tivoli, and many other familiar examples might be adduced as evidences of the judgment and taste which guided the Romans in determining the sites of their more important buildings.

The practice of mediæval art fully concurred with that of the ancients in attaching importance to the mode of placing their buildings, and in the due appreciation of the advantage of a bold and massive substructure. It would, indeed, be difficult to find an example, during the best period of mediæval art, where the basement had not been plainly made the object of especial study and design; although it is certainly obvious, from the great diversity of their practice, that our ancestors had no very fixed rule for their guidance in proportioning their podium to the superstructure. They evidently felt, however, very strongly the good effect produced by marking forcibly the base lines; indeed, those lines are, perhaps, the only very strongly marked horizontal lines in a building of the best age; the stringcourses were held of little account, and the cornices were often very moderately pronounced and constantly interrupted in various ways, but the base lines very rarely. Deeply shadowed and prominently marked, they never fail to arrest attention.

When we carry down our survey to that period in the history of our art which immediately succeeded the prevalence of mediæval forms, we shall still find a full recognition of the importance of the base in every architectural composition. In the Venetian buildings of the quattrocento period notable instances might be adduced, and there is no better evidence of the refined taste of the very early master, Alberti, than the noble basements which he gave to his works. The new front he gave to the Church of St. Francesco, at Rimini, appears to me to exhibit a very fine feeling in this respect. In the works of Bramante, of Raffaele, of Giulio Romano, and of Palladio, you will find the dignified pose of their buildings well worthy of most careful study—a study which it is very certain those distinguished artists never failed to bestow on the subject themselves.

Descending in our view from the period of the Early Renaissance down to the less refined, though, perhaps, still more picturesque, manner that succeeded, we still find the best artists never neglecting that important part of their compositions, the base. Indeed, they amplified the idea, and we find terraces worked up with extreme ingenuity, so as to combine with, and enhance the effect of, their architecture, spreading out, as it were, the base of a building so as to connect it with the ground it stands on, rendering it sometimes scarcely obvious where the domain of the architect ends and where that of the gardener begins.

But I hope that enough now has been said to satisfy you of the attention that is due to the preliminary subject of basements, and I feel confident you will concur with me in what I said at the outset, that, in order to afford unmixed pleasure to the critical eye in viewing a building, the mind must feel satisfied of its stability, and that there are no means so proper for that purpose as providing a good and sufficient visible foundation.

The subject now leads us naturally upwards to the superstructure, and, without entering at present into any question of style, I think that our first business is to consider architectural character in its broadest sense. When we propose to ourselves to design a building, the very first question that should present itself ought to be, what character will it be most fitting to impart to our work? For we may be well assured of this, that however exactly our building may be in accordance with the ordinances of architecture, whatever may be its merits as a composition, however unexceptionable may be its details, if the general character of the building be not in harmony with its purpose a fundamental defect exists for which no amount of art will compensate. Whereas, if the character of the building be in accordance with its purpose and destination, a favourable impression is produced which reconciles us to many blemishes of detail.

I would cite, for example, the principal front of the Imperial Palace at Vienna—a building which has all the worst vices of the most corrupt German school, yet possesses in its well-supported character the great redeeming merit of appearing really like what it is, a great imperial residence.

I would cite, also, the garden front of Versailles—a subject familiar, probably, to most of you; as an architectural composition it is, I think, sadly deficient in character, with little claim to the attribute of grandeur beyond its enormous length, and but feebly suggesting the idea of a great monarch's residence.

To seek for an illustration nearer home, I might point to Whitehall Chapel, a building, the architecture of which seems remarkably expressive of the festive purposes for which it was originally designed; and this illustration is the more instructive when we have regard to the manifest unfitness of the building in all its features, internal and external, to its present purpose. There never was a more grievous misapplication of a fine piece of architectural composition.

I feel the extreme difficulty of defining this quality of character with that precision which one who assumes the office of a teacher ought ever to aim at; but it appears to me to be a consideration involving so much more of feeling and judgment than of abstract reason, or of what logicians term dialectics, that I fear it would be a hopeless attempt to lay down definite rules for insuring propriety of architectural character; we have neither numbers, nor figures, nor words, by which the relative merits, or the essential attributes of art can be gauged or compared with mathematical exactness. We want, and shall never find, a golden mete-wand which shall serve to reduce genius to a matter of calculation, or to supply an unerring criterion of good taste.

We may, however, safely say, generally, of a building, that its character is well conceived, if the intelligent observer is at once impressed by the congruity of its aspect with its destination. I do not mean that a hospital should look lugubrious, or that statues of maniacs should decorate the portals of a lunatic asylum, as was the case at old Bedlam; that would be a gross misapplication of the principle; yet, in such structures as these, there is a plain propriety which forbids the architect to admit an air of levity into his work, or to indulge in fanciful decoration.

To give to a court of justice the rant air of a place of public amusement, or to give to a private gentleman's residence the aspect of an ecclesiastical structure, or of a crenellated fortress in the days of catapults and cross-bows, would be to commit a solecism which no abstract ingenuity of design, nor antiquarian correctness, could possibly justify.

Quite irrespective of style, much of the character of a building depends on its general treatment. I apprehend that a painter who takes in hand some great historical picture would adopt a mode of treatment widely different from that which would guide him in painting some humble piece of *genre* painting, or of still life. So also the architect should certainly adopt his mode of treating his subject to the nature of the building. To design a small village church like a miniature cathedral would be a vulgar error, and the formal, dignified simplicity of a Greek temple would be grossly misplaced in the suburban villa.

To enforce so plain a truth seems almost to demand of me an apology, and yet experience proves that this congruity of style is not seldom least sight of.

At Potsdam, for instance, we see the elegant and stately shaft of a Mahomedan minaret, decked with all the graces of Oriental architecture, degraded to the vulgar uses of a steam-engine chimney built for the supply of water to the Royal kitchen garden.

So we may find, nearer home, that these freaks of genius are not wholly wanting. An admirably-designed Egyptian temple, with its richly-sculptured decorations illustrating the triumphs of Sesostris, forms the façade of a cotton mill.

In all cases, I should say, let the purpose of a building determine its external character; and although the forms of architectural composition may not be so eloquent as always to express very distinctly the nature of those purposes for which a building was erected, yet, let the architect have a care lest he invite ridicule by those flagrant inconsistencies which result from an indiscriminating adoption of an architectural style, in total forgetfulness, or disregard, of the future destination of his work.

Besides the influence that the uses and destination of a building should exercise on the mind of a designer, in determining its architectural character, there is yet another consideration which should never be overlooked by him in making his design.

It is with truth that Pope teaches us to

"Consult the genius of the place in all."

This *genius loci*—the local circumstances of the spot—should not fail to have its due weight in the selection of style and character. For example, amidst picturesque and varied natural scenery, a flat, formal, rectangular façade appears disharmonious and misplaced. On the other hand, in the streets of a city, some uniformity of outline seems preferable to that endless miscellany of houses of varied heights, shapes, and sizes, which make some of our large streets so pre-eminently ugly. It is no uncommen error to design a street façade wholly regardless of this consideration. We too often see, in the midst of the irregularity of ordinary street architecture, an elevation with its centre and wings, a pediment here and a projection there, the whole presenting a complex composition all crowded into a small compass, producing painful confusion instead of that repose which, amidst such discrepancies of form and fashion, the distracted eye so much desires to dwell upon; and this is often done to the serious disarrangement of the building itself, by detracting from its individual importance.

A simple, unbroken front might have claimed our attention, at least, if not our admiration; whereas, with its front broken up into wings and centres, the building loses its unity and individuality, and each fragment of its composition adds but to the general disorder of the scene. We shall find this distinction steadily kept in view by the best masters.

I need but to remind you of the noble specimens of civic architecture with which Florence, Vicenza, Verona, and other great cities in the north of Italy abound, where you will never find a fantastic variety of outline aimed at, but rather that broad simplicity of treatment which is so well calculated to impart individual dignity to each structure.

Whilst, when we turn to the works of the very same masters amidst the beautiful hills of the Brianza, or on the banks of the Po and the Brenta, we see them there relaxing that severity of manner, giving to their plans a playful variety, and to their outlines a picturesque freedom.

Now, with regard to exterior design, the most prominent and important principle of design is form. It is form that is mainly instrumental in giving expression to works of architecture. Color, ornament, the elaboration of the smaller features of a building, such as doors, windows, and the like, all these are, no doubt, useful contributories to the great object of giving character and expression to a building; but they are not alone, and of themselves, sufficient. It is the dome, the spire, the portico, the arcade; these, and such as these, are the forms on which a building mainly depends for its effect.

When these main features affecting the outline of the building are right and true in their proportion and collocation, the design is sure to be successful in securing our respect at least, and fixing our attention; but if these fail, if these great and leading features be disproportioned or out of keeping with the plan and purpose of the buildings or otherwise mismanaged, then all the enrichments of art are exhausted on it in vain; and the most laborious and ingenious details are but labour lost.

In this respect, as in many others, architecture and sculpture are kindred arts. The most beautiful details, the most exquisite finish, the highest polish, would fail to invest a statue with the true character of high art, if it be wanting in fine form; whilst the rudest sketch, the simplest outline, from the hand of a M. Angelo, or a Flaxman, is stamped with immortality.

I would by no means inculcate negligence of detail, nor of finish, nor would I have you in the least degree regardless of the charms of ornamentation. Sir Joshua Reynolds says, with his wonted truth, "As life would be imperfect without its highest ornaments, the arts, so these arts themselves would be imperfect without their ornaments." I do not, I say, seek to depreciate the value of ornamental details. They may most legitimately excite our admiration, by their individual beauty, or by their happy adaptation to their place, or by their rich abundance, or by the judicious parsimony with which they are introduced; and they may act with the utmost effect in giving scale to our work. On this latter ground, indeed, rests the main justification of that crowding together of minute details which characterises the later schools of Medieval architecture.

But ornament, like a highly tempered weapon, needs much caution in the handling. Not only must it be of a kind suited to the character and purpose of the building, but in quantity also it must be carefully apportioned.

These considerations should induce you to attach much importance and value to the proper study of ornamental details, but do not forget that such details should take a secondary place in your professional estimation. It is, I repeat it, the leading and prominent features of your design which are of paramount importance. The experience of every one must be able to afford illustration of this truth, viz., that the most impressive effects of architecture are irrespective of mere ornamental details. After having imperfectly seen a building for the first time at night, or in the shades of evening, and having been deeply impressed with a sense of its grandeur, how often are we surprised (perhaps, indeed, disappointed) on the morrow by finding it of insignificant dimensions, or of mean construction! I have even found in the morning that I have been looking over-night with much interest, perhaps with admiration, at what has turned out to be a temporary scaffolding of poles and tarpaulins. It was its fine outlines, its broad *chiaroscuro*, its deep shadows, which had produced this profound impression. Such is the magic of form, and of an effective management of lights and shadows in our art.

I have but little doubt that the striking effect of a Gothic cathedral is mainly due, not to its intricate enrichments, not to that exquisite elaboration of its detail, upon which indiscriminating admirers of middle-age art are too apt to lavish their exclusive praise (and to which students, allow me to say, are too apt to bestow their exclusive attention), but to the breadth of its main features, to the variety of its masses, and to the grand and surprising effects produced by its lights and shadows.

I am the more led to dwell on this point, because ornament exercises an extremely seductive power over the mind of younger students. Florid beauty in architecture may be well compared to an over-ornate style in oratory. We are dazzled by the splendour of phrases, by the flow of brilliant words; the flowers are strewn before us in such charming abundance that we are led away by our admiration of them, and forget to exercise a calm and rational judgment on the main merits of the production, as a work either of logic or of rhetoric; and we are in no mind to inquire into the fitness or propriety of the decorative adjuncts.

So it is that the younger practitioner in our art (and, perhaps, in the sister arts), is easily reduced, through an erroneous estimate of the value of this secondary object, or by a latent desire to display his dexterity in superficial embellishment, to impair the breadth and solidity of his essential design.

I trust that I have said enough to establish in your minds my position that the vital principle of architectural design is form.

I think that there are three principal and very distinct sources of beauty in architectural composition:—

1st. There is a beauty in the aptitude of a form; that sense of satisfaction which the mind experiences when perceiving the nice adaptation of any object to its purpose.

2nd. There is the beauty of symmetry: that pleasing impression produced, I know not why, by regularity of arrangement, and by exact correspondence of the several parts. Perhaps this sense of the beauty of symmetry may be founded on the almost universal pre-

valence of unsymmetrical arrangement in the works of nature, whether in animate or inanimate creation.

3rd. There is the beauty of the picturesque: a pleasing impression (differing very widely from the last, and sometimes almost opposed to it, and equally difficult to account for), which is made on the mind by irregular but not confused or discordant combinations of form.

I do not pretend that under these three heads all kinds of formative beauty can be classed, but they may be quite sufficient to engage our attention on the present occasion.

It is not only good taste, but common sense, that teaches us that a form should be fitted to its purpose; and, as I have said, the fulfilment of this first great condition is in itself an element of beauty.

But I am afraid that the more dry, unimpassioned beauty resulting from the quality of fitness, however it may satisfy the engineer, will hardly suffice to meet the aspirations of the architect.

As sensible men, we cannot admit the beauty of any object that is irrational, or idle, or inapplicable to its purpose; yet, as artists, or intelligent observers of art, we desire this, and something more. I think that this kind of beauty and the distinction which I am endeavouring to draw, may be illustrated by a very simple comparison between two familiar forms, that of the early Classic, and that of the early Medieval art. Both are so far beautiful, inasmuch as both are perfectly adapted to their purpose; both convey in the simplest and most effective manner the vertical pressure of the super-imposed weight down on to the circular shaft, whose office it is to bear that pressure.

Both are alike honest and simple; but an absence of refinement, not to say a rudeness, characterises the Norman capital; while the more ancient type, although honest and simple enough, gives evidence of a more refined feeling, a more skilful working out of an idea, a quality which distinguishes the Greek artists from all others. The parabolic curve of the echinus shows a nicety of execution which the mathematician only can fully appreciate, or even comprehend, but the higher merit of which all can feel.

It is said by Cicero "*Venustas et pulchritudo corpora secundum non potest a valetudine.*" We, in like manner, might say that it is difficult to distinguish clearly between the beauty of an architectural form and its strength or ability to fulfil its task. This quality of suitability of form will ever be held in popular esteem, for it can be understood and perceived by all, whilst it is the privilege of the few only to estimate æsthetic beauty at its true value. In this country, especially, where the general mind loves to hover in the lower atmosphere of practical science, and soars reluctantly into the higher regions of æsthetic, this utilitarian quality has peculiar attractions. There are thousands of otherwise highly educated minds which distinguish no superiority in a Greek vase over an ordinary garden pot. Both, they will say, are alike adapted to their purpose; both fulfil their destinies with equal efficiency, therefore both are alike worthy of our approval. I have known a critic of this school condemn to utter ridicule a colonnade of finely proportioned stone columns as being a clumsy contrivance, inasmuch as they are, perhaps, 4 or 5 feet in diameter, whereas plain iron posts, a few inches only in diameter, would have answered every purpose.

To answer such criticism is but labour lost, and the sorrowing artist has but to sigh and pass on.

"Miserecordia e giustizia gli sdegnia,
Non ragionam 'di lor, ma guarda e passa."

I now proceed to the second source of beauty, Symmetry.

Our great master, Vitruvius, thus instructs us: "Symmetry," he says, "results from proportion. Proportion is the commensuration of the various constituent facts with the whole; in the existence of which symmetry is found to consist; for no building," he says, "can possess the attribute of composition in which symmetry and proportion are disregarded."

It may be difficult in few words to express all that is intended to be comprised in that word symmetry; but there can be no doubt that the great balance and correspondence of component parts, and the regularity of their general arrangement, which constitute the essence of symmetry, is a never failing source of pleasure to the critical eye; and here we perceive (what I have already adverted to) an instance of the analogy which our works bear to those of nature, who, in her greatest work, man, the human frame, has set before us an eminent example of perfect symmetry.

This quality has ever been eminently architectural. We recognise the attribute of symmetry in the avenue of Sphinxes at Memphis; in the façade of a Greek temple; in the long-drawn aisles of a Gothic cathedral; in the stately colonnades which surround the cortile of St. Peter's. We find it in its highest condition in the works of the best Italian masters; pre-eminently, perhaps, in the works of Palladio. A want of symmetry in parts, where its want is patent, is a fundamental defect which no art can hide, and for which no beauty of individual parts can compensate.

The want of due proportion between the dome of St. Peter's and the body of the building has been often remarked by critics, and not without ground, as an instance of this defect, and I might cite an example of a like defect, although under very different circumstances, at Munich. There the enormous statue of Bavaria crushes into Lilliputian insignificance the otherwise pleasing colonnade which accompanies it. In this case, had it been the artist's purpose by this interchange to enhance the size of his statue (whose bulk may be comprehended from the fact that twenty persons can find sitting room in the head) he might have been welcome to sacrifice a whole hectomètre of life-size statues around the feet of his colossal image; but it was treason to architecture thus to reduce a fine Doric portico to the proportions of a plaything, and to sacrifice the dignity of our art in order to magnify the vastness of his figure.

I proceed now to the third source of architectural beauty, viz., that resulting from the picturesque.

If there is difficulty in defining symmetry in few words, a succinct definition, or, rather, description, of the word picturesque is far more difficult. As I have said last week, there is no quality which it is more dangerous to affect than this, for the spell is at once broken, and the author loses the reward of his art as soon as it is perceived that there has been a laboured effort made to produce it: like the Spartan rogue, who only gained a lawful exemption from punishment for his theft by the dexterity with which he contrived to commit it.

The ecclesiastical and castellated piles of the middle ages are perhaps the most striking as well as the most familiar illustrations of this high quality of art, if art it may be called, where concealment of art is the best proof of its influence. But I last week sufficiently discussed this subject of the picturesque.

But there is a principle which I should notice here as being applicable to all large architectural compositions, and to none more so than to those of picturesque character. I refer to a certain subordination of the various parts of a composition to one predominant feature or group.

In every large composition, whether it be a building, or, as I believe, a picture, a kind of unity should be preserved by concentrating effect; by giving, not indeed an undue preponderance to any one portion of the design, but a decided and clearly marked preponderance to one portion, for I think it is a remark of very general application, that where interest is scattered it is sure to be weakened.

Our own St. Paul's is an instance especially in point, and affords a remarkable example of happy adjustment of its various parts, giving to the dome just importance enough to secure its preponderance without overwhelming the subordinate parts of the design.

The superiority of the effect of those cathedrals, such as Salisbury, Lincoln, Lichfield and others, which have main central spires, over those where that main feature is wanting, such as Westminster, Winchester, and Peterborough, is also an obvious illustration.

It was, no doubt, to some æsthetic consideration of this nature that we owe the noble gate towers of our colleges, and some of our old baronial residences, such as Bureleigh, Knowle and the like. These central features, rendered forcible by their superior height and enrichment, connect, as it were, the various parts of the composition, giving it that unity which, as I have said, adds so much value to a design. I might name Greenwich Hospital as a building which must be regarded as very deficient in this respect; and I can hardly doubt that this building, as we now see it, is but part of a larger and more connected design, which its distinguished author was unfortunately unable to realise.

You will have observed that in the somewhat desultory remarks I have addressed to you this evening, the subject of styles has been but slightly touched upon.

This has arisen from no want of due appreciation of the importance of that subject. There is no doubt whatever that a thorough, discriminating knowledge of the several recognised

styles that have prevailed in the more highly civilised countries of different ages, forms an essential part of the education of an architect. But I believe I shall be best fulfilling my duties here by drawing your special attention to those broad principles of design that seem alike applicable to all styles; to a right understanding of which principles, the acquirement of a knowledge of details must, as it seems to me, be always subordinate.

It would, doubtless, be taking a very narrow view of the study of the art, to confine our admiration or to limit our attention to any one style, whether it be that which flourished under Pericles or that which reached its culminating point under Saint Louis or our Edwards, or that which left in the great municipalities of North Italy enduring monuments of originality and genius.

The time may come when architecture, unencumbered by prejudice or pedantry, may cease to feed on the past, and take a loftier and nobler flight.

Two revivals have marked the history of modern art. There was a great revival in the fifteenth century. Nothing could exceed the enthusiasm of the artistic world when Lorenzo assembled around him the scholars and artists who effected that great change; but with all their ardour there was no want of discriminating judgment. They dug up, and measured and studied, with minutest care, the works of the Classic ages, but they wrought themselves in an unfettered spirit.

The style of antiquity was by them so modified to suit the wants and habits of modern civilisation, that their works became as much marked by originality as by beauty. It may be, indeed, questioned whether the world has yet seen men altogether equal to some of the quattrocentists.

Let us have a care that the second revival—that of the nineteenth century—is not marked by a narrow, sectarian spirit, and by the ignoble results inevitably attendant on a blind, servile, superstitious adherence to precedent—a feeling from which the great movement of the fifteenth century was so entirely free.

No doubt, the arts have advanced much since painters habitually drew the heads of men and women with their elongated eyes placed somewhere about their temples, and represented their horses stepping out with both legs together on the same side. But it is undeniable that in our art we have yet much to unlearn, many prejudices to dismiss, much rust to rub off before architecture can take its true place.

It may be long before a Giotto or a Bacon arises in our art, but we may look forward hopefully to the result of a combination of many minds acting in an earnest spirit and guided by right principles.

ROYAL HORTICULTURAL SOCIETY'S ARTESIAN WELL.

THE monthly summary of the proceedings of the Royal Horticultural Society gives some particulars relative to the sinking of the artesian well in the Gardens by Messrs. Easton, Amos, and Sons, who were so confident of success that they undertook the work on the principle of "no water no pay," guaranteeing a supply of seventy-five gallons per minute. The well is now bored, and the confidence of the engineers has been justified by the result. Not only has the well been sunk at the estimated cost, and water been found at the expected depth, but it has been found of the purest and softest quality, and in such abundance that, instead of supplying merely from 100,000 to 110,000 gallons in the twenty-four hours (the quantity stipulated for), it can readily supply a million gallons in that time, if larger pumps and more powerful engines were employed. The total depth sunk and bored is 401 feet—a well having been sunk to the depth of 226 feet, and a bore thereafter carried down 175 feet further. The London clay was found to be of unusual depth, the thickness of the stratum passed through being 198 feet. The two wells (that at Trafalgar-square and that of the Society) correspond in one point, which is of excessively rare occurrence, wholly beyond provision, and a pure matter of chance: out of numerous wells bored by Messrs. Easton, Amos, and Sons, for instance, these two are the only instances in which it has occurred. Whilst boring through the chalk, in both cases, the instrument came upon a fissure, and dropped down a space of several feet. To understand the significance of this, it is necessary to remember that the way in which the water in the chalk finds its way to the surface, or into the ocean, is through such fissures. An example of its finding its way to the surface from them may be seen in the River Wandle, which takes its rise at Carshalton, near Croydon, pouring out of its source through such fissures a river ready made. An instance of its falling into the sea out of such fissures may be seen at low water near Brighton, where a succession of vertical fissures, from the narrowest chink to 6 inches wide, occurring at varying distances from each other, pours out an immense quantity of fresh water. Such fissures act as the main channels by which the water in the chalk finds its way into the sea. When a well sunk into the chalk does not fall upon one of these, it is dependent for water on what may percolate through the surrounding chalk into the well; but, if it hits upon a fissure, it draws its supply from a stream itself, and it will, of course, depend upon its size how far it may be exhaustible. The quantity of water percolating through the chalk, however, is so great that, for all ordinary purposes, any well sunk for some depth in it is sufficient. If a very large supply is not wanted, the only drawback on such a well is that it may be lowered by unusual or continuous pumping, so as to require some time to be given to allow it to refill, and that in course of time the standing point of the water gradually sinks. A well which has dropped upon a fissure, on the other hand, may apparently be pumped for ever without lowering its standing point. It draws its supplies from a running stream, as it were, and as fast as it is pumped out it flows in. This remark, however, only applies to the standing-point when it has once been found; for, after the well is opened and first tried, there is always a falling, from the effects of pumping, until the proper level is reached. In the Trafalgar-square well the standing level (which was found after the first 48 hours' pumping, during which the surface of the water was lowered 4 feet) has been constantly maintained since 1844, and, as the same amount of pumping at South Kensington has lowered the surface of the water only 16 inches, it is reckoned that the supply of the Society's well will be much larger than at Trafalgar-square. The standing level of the Society's well is higher than at Trafalgar-square—a circumstance which may, perhaps, be accounted for by the greater number of other artesian wells sunk to the eastward of the latter, and possibly, also, by its being nearer to the outlet of the water.

A woodcut, which accompanies the summary, shows a section of the Society's well, and of that which supplies the Trafalgar-square waterworks.

THE EXHIBITION BUILDING.—On Saturday week the eastern dome, as far as its main features of construction are concerned, was completed. At three o'clock the centreings of the twelve ribs were knocked away, and the immense mass of metal stood for the first time supported alone by the columns and girders. At the time of striking away the wedges there were present Mr. Thomas Fairbairn; Mr. Baker, engineer to the London and North Western Railway; Mr. Peter Rolt, of the Thames Iron Works; Captain Ford, Mr. Meeson, and several other gentlemen interested in the progress of the works. There still remains the glazing and some of the minor portions of the work to be completed, but the "big dome" is practically finished.

ANCIENT AND MODERN SUPPLIES OF WATER IN ROME.*

AMONG the marvels of ancient Rome, and the most wonderful, are the aqueducts. When we consider their great number and immense cost, in order to conduct water 30, 40, and 60 miles into the city, we are struck with surprise. Pliny tells us of the inconceivable quantity of water thus brought to Rome for public uses, for fountains, baths, fishponds, private houses, gardens, and country seats; of costly aqueducts and conduits, mountains cut through, rocky hills bored, and deep valleys filled up;—in short, they were at that period, the most wonderful works of art and engineering skill in the world.

For 440 years the Romans made use of no water but that of the Tiber, and of wells and fountains of the town and neighbourhood; for the latter they evinced great veneration, because the waters were supposed to restore the sick to health. About the year 441 of Rome, the necessity was felt of conveying water in a supply abundant not only for domestic but for public uses, for there had existed, since the reign of Tarquin the Elder, 138 to 176 sewers, one of which, the Cloaca-Maxima, received all the impurities of the town, and had to be flushed with large quantities of water to sweep the refuse into the Tiber.

Sextus Julius Frontinus, superintendent of the water supplies and aqueducts of Rome under the Emperors Nerva and Trajan, has left us a description of these works. His writings were translated by Rondelet in 1820. Two or three years ago M. Rozat, Ingénieur des Ponts et Chaussées, published a work reducing the modern formulæ into practical results for the flow of water through such channels as the ancient city possessed, and they have corresponded singularly with the supply of water ordered to be provided for the city by the several governments under which the works were carried on.

The modern waterworks have been investigated by M. Oudry, Ingénieur des Ponts et Chaussées, employed on the railways at Rome, and the Inspector-General Mary furnishes his own notes of the measure, volume and distribution; from notes made on the same spot by the permission of M. Bianchini, Engineer of the Municipal Service of Rome.

In the year 442 the Appian viaduct was constructed, by which the first supply of water was conveyed to Rome. It is spring-water. The length is 1,190 Roman paces, of which 1,130 were underground and 60 on substructions and arches.†

In the year 484 a supply by the aqueduct of Anio the Ancient was laid on from the river Anio. Its length was 43,000 paces, of which 42,779 were underground.

127 years afterwards, in the year 608, the Appian and Ancient Anio aqueducts having become dilapidated, and the water being fraudulently drawn off here and there by private individuals for their own use, the Government put them into a state of proper repair, and added a third aqueduct, then rendered necessary by the increase of the city; this was the Marcian aqueduct.

According to Frontinus the sum of 8,400,000 sesterces (£90,720) was granted to one Marcus, a money-lender, to conduct water from springs existing on the right bank of the Anio. The total length of the aqueduct was 61710·5 paces; the subterranean portion is 54247·5 paces, above ground 7436 paces.

In the year 627 the Tepulian spring was conducted to Rome, and in 719 the Julian source was joined to it. The length of this conduit is 15,426 paces, of which 6,472 are on arches.

The aqueduct of the Virgin Water had a total length of 15,510 paces, of which 1,405 were in subterranean canals, 12,865 in conduit under ground, and 700 on arches.

About the same period the waters of the lake Aletinus were conveyed to Rome; of inferior quality, they were destined chiefly for the *naumachia*, or theatre of naval engagements of Augustus, and for the irrigation of the gardens, &c. They were 22,172 paces in length, 358 being on arches.

In order to supply the deficiency of the Appian and Marcian aqueducts in time of drought, Augustus caused to be diverted into the Appian aqueduct a stream (name not mentioned), conducted underground for a length of 6,380 paces, and into the Marcian supply (by a subterranean canal of 8,006 paces) the waters of a source which took the name of Augusta, on the right bank of the Anio, at the height of the Marcian.

Under the reign of Augustus, Agrippa caused all the ancient aqueducts to be repaired, added more than 330,000 feet of new ones, and constructed 130 reservoirs, 500 fountains for public use, and 700 drinking troughs; he adorned these works with 500 statues and 400 marble columns. Agrippa, we are told, opened the sluices which hemmed up, in seven great reservoirs, the waters brought to Rome by as many aqueducts, and flushed the sewers of the city with these seven rivers, which carried off immediately all the accumulated filth. He afterwards took a boat and navigated the cleansed sewers as far as their outlet into the Tiber. The sewers were 17·08 English feet wide and 13·78 feet high.

After these aqueducts no others were constructed till the time of Cæsar Calpurnia. At this epoch the seven existing supplies appearing insufficient for public use and private luxuries, Cæsar commenced two others, which Claudius his successor completed with great magnificence. The first of these supplies conducts to Rome the waters of the Claudian source, situated, as the Marcian and Augustan, on the right bank of the Anio.

* Contributed.

† The Roman pace was 4·870 feet, and the Roman foot 11·6935 inches.

‡ Frontinus calls all parts underground, *subterranean*, those supported on solid walls, *substructions*.

§ Frontinus generally keeps silence in his writings as to expenditure. Rondelet values the sesterce of 686—907 at 0·27 of a franc—about one centime more than a Spanish real do vellen of our day.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry must be supported by proper documentation and that the records should be kept up-to-date at all times.

2. The second part of the document outlines the procedures for conducting regular audits. It states that audits should be performed at least once a year and that the results should be reported to the appropriate authorities. It also mentions that any discrepancies found during an audit should be investigated immediately.

3. The third part of the document describes the various methods used to collect and analyze data. It includes information about the different types of data that are collected, such as financial data, operational data, and customer data. It also discusses the various techniques used to analyze this data, such as statistical analysis and data mining.

4. The fourth part of the document discusses the importance of data security. It states that all data must be protected from unauthorized access and that appropriate security measures should be in place to ensure the confidentiality and integrity of the information. It also mentions that any breaches of security should be reported immediately.

5. The fifth part of the document discusses the importance of data backup and recovery. It states that all data should be backed up regularly and that a plan should be in place to recover the data in the event of a disaster. It also mentions that the backup process should be tested regularly to ensure that it works properly.

6. The sixth part of the document discusses the importance of data retention. It states that data should be retained for a specific period of time and that it should be disposed of properly after that period. It also mentions that the retention period should be determined based on the type of data and the applicable laws and regulations.

7. The seventh part of the document discusses the importance of data privacy. It states that all data must be handled in a way that respects the privacy of the individuals whose information it contains. It also mentions that appropriate measures should be in place to ensure that the data is not shared with unauthorized parties.

8. The eighth part of the document discusses the importance of data quality. It states that all data must be accurate and reliable and that appropriate measures should be in place to ensure that the data is of high quality. It also mentions that the data should be reviewed regularly to ensure that it is up-to-date and accurate.

9. The ninth part of the document discusses the importance of data governance. It states that there should be a clear policy and process for managing the data and that all employees should be trained on the proper use of the data. It also mentions that the data governance process should be reviewed regularly to ensure that it is effective.

10. The tenth part of the document discusses the importance of data innovation. It states that the data should be used to drive innovation and that new technologies should be explored to improve the way the data is collected, analyzed, and used. It also mentions that the data should be shared with other departments and organizations to promote collaboration and innovation.

Its length was 46,406 paces, of which 36,230 were subterranean, 609 in substruction, and 9,567 in arches.

The second aqueduct conducted the water derived from the river Anio higher up the stream. It is naturally turbid and muddy in rainy seasons, so that purifying filters were disposed along its course. The length of the new Anio aqueduct was 58,700 paces—viz., 49,300 subterranean, and 8,791 on arches. The arches of this supply are the most elevated, attaining a height of 108 feet. The Claudian aqueduct, in the environs of Rome, is borne upon the same arches as the new Anio.

The Neronian and Marcan constructions in the interior of Rome, with the exception of the aqueducts of the Virgin and Alsietina waters, arrived at Rome near the Porta Major; from this point, arches, described by Frontinus as considerable, carried the new Anio and Marcan supplies on to the Celius and Aventinus mounts.

Such were the chief of the Roman aqueducts as they existed at the end of the first century of our era. In the following summary the total lengths are given in English feet.

	English Feet.
Appian and Augustan	85,568
Ancient Anio	209,610
Marcan	300,528
Topulian and Julian	75,125
Virgin	75,534
Alsietina	107,978
Augusta (branch)	3,896
Claudia	225,097
New Anio	285,869

Total..... 1,364,904

Of these totals we have—

	English Feet.
Underground	1,194,984
In substruction	14,780
On arches	166,140

Total..... 1,369,904

As to the system of construction, the Roman aqueducts were canals lined with masonry, some buried underground, others supported on solid masonry, or on arches to maintain a uniform inclination. The first aqueducts built were of a rectangular section, the later were constructed with semicircular arches. We have no data as to the section and mode of construction of the portions underground; as to the aqueducts on arches, we have some dimensions and sketches. The arches of the latter vary in span from 17 feet 7 inches to 26 feet 9 inches.

In a fragment of the Claudian arches, of 75 feet 6 inches in height, the span was 19 feet 6 inches; the thickness of the piers, 14 feet 6 inches; width of piers at right angles to axis of aqueduct, 10 feet 9 inches; thickness of arch at keystone, 2 feet 7½ inches; the invert was on a level with the extrados of the arch and the rectangular section of the aqueduct, 5 feet 10 inches by 4 feet 3½ inches high; the side walls and covering of the aqueduct, 3 feet 3 inches thick. The masonry of the arches were of stonework; the side walls of the watercourse seemed to have been of concrete.

The Neronian arcade for the new Anio was in spans of 26 feet 3 inches; width of piers, 7 feet 7 inches; height of ditto up to springing, 52 feet 6 inches; the transverse section of watercourse, with semicircular arch, 2 feet 7 inches span, 7 feet 4½ inches from invert to soffit of arch; it was constructed of brick.

The aqueducts in general had three stringcourses of dressed stone, one at the springing of the arch, and the others at the invert and summit of the culvert. The covering was either flat or sloped on each side if the section was rectangular, or curved if it was semicircular.*

ARCHÆOLOGICAL INSTITUTE.

At a meeting of the Archæological Institute, held February 7th. Professor DONALDSON in the chair, Professor WESTWOOD, of Oxford, gave an account of a visit made by him to Trèves last year, and exhorted his hearers to go there in search of objects of ancient art. He described the museum as full of curious and most interesting objects, but with no order or arrangement whatever; he mentioned the Evangelary MS., a gift of the Sister of Charlemagne, also a Book of the Gospels, written by the monks of Riehenan for Archbishop Egbert. He exhibited a casting from a fine ivory—St. Helena entering some city in procession—the work of the time of Charlemagne. In the western crypt of the cathedral they have lately found a well; it may have been used in the earliest times for baptizing.

Professor DONALDSON, agreeing with Professor Westwood as to the interest of Trèves to the archæologist and student of art, pointed out the importance of forming a collection of ivories as illustrative of art, and mentioned the valuable works on this subject by Mr. Digby Wyatt and Mr. Edmond Oldfield.

Capt. WINDUS, R.I.N., then read an account of a great carrack, or man-of-war, built by the Knights of St. John, at Nice, in 1530. It was one of the fleet sent by the Emperor Charles V., in 1535, against Tunis. She was named the *Santa Anna*, and attracted much attention from her size, armament and fittings; she had six decks, and her crew was 300 men. The "carrack" figures in the frescoes of the Palæes of the Knights Hospitallers at Rome.

Mr. W. BURGESS read a notice of a tomb erected in honour of an officer lent to the Florentines, by Amerigo de Narbonne. He is represented on horseback. The armour, of which Mr. Burgess had sketches, differs from the armour of the same period in England, when plates of leather or metal were worn with mail armour; this change commenced probably in Italy.

Mr. R. G. P. MINTY exhibited photographs of the church at Harting, Sussex, and of two tombs and effigies of Sir Edward Caryll, of Ladyholt-park, in that parish, and his son Sir Richard. The chancel or monumental chapel has been lately removed; the family is extinct.

Mr. E. GONWIN sent a notice, with drawings, of the Tower of St. Philip's

* To be continued.

Church, Bristol; it was of the thirteenth century, and was suffering from neglect and age; he suggested that the Institute might do good by calling attention to the subject.

A curious image of lead was exhibited by T. A. ROBERTS, Esq., M.P., through the Tithe Hon. Sir EDMOND BEAN. It was found in Cornwall, near one of the ancient smelting-houses, called in the county "Jews' Houses."

A bronze sword, found in the River Lea, of remarkable length, was exhibited by Mr. A. W. FRANKS. Another, of remarkable form, Lincolnshire, and some Persian arms, were exhibited by Mr. W. I. BERNHARD SMITH; some stone celts, from Ireland, sent by the Rev. G. Mellor, of Warrington; and some curious mining axes, sent by Sir R. Murchison, from the Museum of Economic Geology.

HISTORY OF THE DISCOVERIES AT HALICARNASSUS.

THE magnificent but too costly work by C. T. Newton, Esq., M.A., late H.M. Consul at Halicarnassus, a "History of the Discoveries at Halicarnassus, Cnidus, and Branchidæ," is severely criticised by Mr. Fergusson, who, writing to the *Athenæum*, says:—

As an architect, I dissent from the restoration of the Mausoleum therein contained, because it makes one of the most hideous buildings ever dreamt of out of what all antiquity agreed was one of the most beautiful. Under any circumstances, a great cubic mass of plain masonry 119 feet by 88 feet in plan, and 65 feet high, unrelieved by either sculpture or architectural ornament, is as ugly a feature as ever issued from the hand of man; and when used as a base for a delicate and highly-ornamented Ionic order, it also becomes one of the most inappropriate. Above this, in Mr. Newton's restoration, there is nothing but a low flat pyramid—truncated to receive the quadriga, but so arranged that it can nowhere be seen itself, but manages at the same time to prevent the sculpture it supported from being visible within any moderate range of vision. If the Greeks did all this, they were a wonderfully stupid and inartistic people.

As an archæologist, I dissent from Mr. Newton's views, not only because they are in direct contradiction to Pliny's text, on which all restorations of this monument must be based, but also because they do not agree with his own discoveries. Pliny says the pyramid terminated in 'Metæ cacumen'; Mr. Newton denies this. He says these words mean nothing. Pliny says the pyramid and the quadriga equalled the height of the basement; Mr. Newton says they did not, and alters 'altitudine' into 'altitudinem' in the text, in order to escape the difficulty. Pliny says the cella was 'brevius à frontibus'; Mr. Newton makes it—practically—square. His own discovery of the Cymatium moulding with the lions' heads proves incontestably that the intercolumniation was 10 feet 6 inches; Mr. Newton makes it 10 feet. He quotes as a fact Guichard's description of the opening of the tomb, and then, by the restoration, shows that the tale must have been absolutely false, and so on throughout the whole. It would be tedious to point out all the discrepancies that necessarily follow from the above. The real question that interests the public is, is all this necessary? Cannot the Mausoleum be restored in accordance with Pliny and the recently-discovered facts? The answer, it appears to me, is, that there is nothing so easy or more certain.

In this very book Mr. Newton gives a plan, section and elevation of the Lion Tomb at Cnidus. Like the Mausoleum, it consists of a square basement, a pteron of columns, a pyramid of steps, and, lastly, a 'Metæ cacumen,' in the shape of a pedestal supporting the piece of sculpture which was the crown of the whole. It is inconceivable that any one can look on this and not see that it contains the solution of the whole difficulty. On the pyramid at Halicarnassus there must have been a pedestal, according to my restoration, 20 feet by 16 feet in plan, and 12 or 13 feet in height, on which stood the quadriga.* If any one will draw it out, he will see at once how indispensable it is to architectural effect; but, further than this, it makes all Pliny's dimensions clear. Thus:—

The pedestal was	Ft. In.
The steps of the pyramid were, as Pliny says	13 6
The quadriga	24 6
	13 3 Ft. In.
The pteron or order, both according to Pliny and the remains	51 3
The basement, the same as the upper part	37 6
	51 3
Making up Pliny's total of	140 0

So far, therefore, all is clear and certain.

With regard to horizontal dimensions, if we assume the intercolumniation, as shown by the remains, 10 feet 6 inches, we find that the angle columns were coupled: both the artistic and constructive exigencies of the building require this, and the remains show it. With this and the introduction of the pedestal as above pointed out, any one may now restore the Seventh Wonder of the world, so as not only to be a beautiful building artistically, and in accordance with all we are told of it by the writers of antiquity, but quite unlike the building as restored in this book.

I cannot conclude this letter without entering my protest against the mode in which it has been published. A five-guinea book might have contained all the information this one does and a great deal more. But in that case only 250 guineas would have been received from the Trustees of the British Museum; by slightly increasing the bulk and more than doubling the price, raising it to twelve guineas, 600 guineas were obtained. The public are thus either mulcted of seven guineas or debarred from the information the book is supposed to contain.

In the present instance this is not of much consequence, as the originals of all that is valuable are to be seen in the Museum, except the por-

* I believe the lowest step of the pyramid was 2 feet 6 inches in height.

trait of the author, figured as "A Colossal Lion," plate LXI.—while for a couple of shillings, any one may purchase the blue-book containing all the information of the text. Still, I hold it to be a principle that when a public body subscribes public money, it ought to be to cheapen, and not to enhance, the price of information afforded to the public, nor to assist one of their own servants in what promises to be a successful speculation.

But it is, in this case, worse than this. The fifty copies which the Trustees have taken will be distributed to all the great Museums and Libraries of the Continent, as the one great work of its class which the Government of this country have thought worthy of its patronage, as a model of our taste in Art and of the depth of our learning! One shudders to think how they will exult—how they will laugh at us poor benighted insulaires, when they contemplate this wonderful performance brought out under the patronage of the Trustees of the British Museum.

What must foreigners think of the position of Art in England in 1862?"

"JAMES FERGUSON."

THE PUBLIC SEWERAGE WORKS, WEST HAM.

THE sewerage works for the district of West Ham are now completed, under the direction of Mr. Robert Rawlinson, C.E. The first main sewer contract having been let in April, 1858. The parish of West Ham consists of the sub-districts of Stratford, West Ham, and Plaistow, and comprises an area of about 4,735 statute acres, according to the parish survey of 1821. The lowest surface area is near Hallsville, and is about 4 feet above ordnance datum. The highest surface area is near Forest-gate, and is about 45 feet above ordnance datum. The difference of level within the parish is, therefore, about 41 feet. A considerable portion of the parish is marsh, protected by artificial embankments, from tidal waters and land floods, which rise to a height of from 6 to 10 feet above the surface of the land. The distance from the outlet works to the end of the sewer, near Forest-gate, is about three and a half miles; at Bow-bridge, two and a half miles; in Romford-road, two and three quarter miles; in Barking-road, one mile and three quarters; and in Lilliput-road, Victoria Docks, one mile and a half.

The outlet works consist of a pumping establishment and a low-water or relieving flood-water sewer. The pumping establishment is erected on land purchased by the local board at Canning Town, and consists of an engine-house, boiler-house, coal-store, workshop, and engine chimney, with pumping wells, outlet wells, and outlet pipes.

Two condensing engines (of 40-horse power each) have been provided. Each engine works two pumps, of 48 inches diameter, and 3 feet stroke. The two engines are capable of lifting about 30,000,000* gallons in twenty-four hours. The pumps are so arranged as only to lift to the level of the water in the river. The lowest lift is 8 feet, the highest lift is 22 feet. The inlet and outlet pipes, to and from each set of pumps, are 30 inches diameter. Self-closing flap-valves are fixed on the outlet pipes at the river walls.

A low-water or relieving flood-water outlet has been formed at Bow Creek, near Barking Road Station. The river Lea at this point is nearly four feet lower, at low water of spring tides, than the bed of the river opposite the pumping works. This outlet, which is self-acting, discharges the flood-water for several hours each day without pumping. In the outlet well adjoining the river, two self-closing flap-valves, similar to those at the pumping outlet, have been fixed, and, as a precautionary measure, one screw-down sluice has been placed in the manhole in Barking-road.

The larger main sewers are formed of brickwork; smaller sewers are of stoneware pipes. Cast-iron pipes have been used for crossing navigable rivers, and also for crossing marsh drains, and for the main outlets.

Brick sewers are egg shaped on section, and vary in size from 5 feet 3 inches by 3 feet 6 inches, to 2 feet by 1 foot 4 inches. The whole of the brickwork is set in the best blue lias hydraulic mortar. Stoneware pipes are circular on section, and have half-socket joints. Cast-iron pipes are circular on section, and are formed with flange or socket joints. 24,227 lineal yards of brick sewers, 27,098 yards of stoneware pipe sewers, and 210 yards of cast-iron pipes, making a total of 52,135 lineal yards, or 29 miles 1,095 yards have been constructed and laid within the district.

The sewers throughout the district have been designed with a view of obtaining the best practicable gradients, more especially for tributaries. In some cases, however, it has been necessary to lay the mains with a fall of not more than 1 in 3,520, or 18 inches per mile.

On plan, they have been laid in straight lines; and on section with regular gradients. At each change in direction, for alteration of gradient, a man-hole or lamp-hole has been constructed. The main outlet sewers in Canning Town have been laid level, and the inverts are formed of cast iron, to allow of their being laid and formed under water.

Considerable difficulties were experienced in the construction of the sewers in some portions of the district, arising from loose, wet, spongy, and other unfavourable descriptions of subsoil, and from other causes. Upwards of three miles of main sewers have been laid with cast-iron inverts, at or near the level of low water of spring tides, at the Barking-road outlet.

The main sewer crossings, under three branches of the river Lea, consist of cast-iron pipes of 2 feet 6 inches, and 2 feet diameter. At each end of these cast-iron pipes under the rivers a manhole is constructed, with screw-down sluices, which may be put down in case of injury to the pipes under the rivers and thus prevent flooding in the low districts. The river crossings were executed by Mr. Munday. By staging over the rivers, joining the pipes, dredging the lines of mains, and lowering each entire length of pipe to its position, stoppage of river traffic was rendered unnecessary, and claims for compensation, which might otherwise have arisen, were, by these arrangements, prevented. Main and branch sewers have been constructed under the North Woolwich, the Barking and Tilbury, and Eastern Counties Railways, in eight separate places.

Flushing arrangements are of three classes—first, by the admission of water into the sewers through sluices, hose pipes, or valves; second, by screwing down fixed sluices built in certain manholes, allowing the sewage water to accumulate,

and suddenly raising the sluice; and, third, by inserting loose paddles in the grooves provided in nearly all the manholes. By one or other of these arrangements the whole of the sewers within the district may be flushed.

About 310 feet in length of river wall has been put in, bounding the land belonging to the Local Board. This wall is constructed of brick and concrete, coped with stone.

The district presented several difficulties to the execution of a system of sewers which should be cheap in proportion to the number of inhabitants accommodated, and the value of property to be rated. The low flat site, the water-logged subsoil, the treacherous ground in places (silt, peat, and quicksand), the extended area, the population grouped on sites entirely separate and wide apart, the narrow streets, and great depths of the sewers in some parts, as along West Ham-lane, along Romford-road, and in other places; the great traffic on the turnpike trust roads, crossing marsh ditches, crossing beneath railways running trains at certain times of the day every quarter of an hour, and crossing the river Lea and its navigable branches, offered obstacles only to be overcome by money expenditure. An increase in the price of bricks to the extent of 25 and 30 per cent., and an advance in wages, caused loss to the early contractors, and added, in the later contracts, to the original estimate.

The total cost of the works has been £92,022.

APPLICATION OF CHARCOAL TO SEWER VENTILATORS.

THE Engineer and Medical Officer of Health have reported to the Commissioners of Sewers of the city of London as to the result of experiments in the application of charcoal to the ventilation of sewers, with the view of testing its effects, the experiments were suggested by the facts detailed in the report of the Medical Officer on the ventilation of sewers, and on sewer gases, in 1858, wherein he described the powerful oxydising effect of charcoal as determined by the investigations of Lowitz, Saussure, Thénard, and others, at the beginning of the present century, as well as by the recent inquiries and practical results obtained by Dr. Stenhouse. All of these tend to prove that charcoal has the power of absorbing and oxydising the miasms of organic decomposition, when, with atmospheric air, they are passed over it. In commenting on these facts, it was remarked that in common wood charcoal there was evidently a powerful means of destroying the foul gases of sewers; and that the practical application of it was fortunately a question of but little embarrassment; for, to use the words of the report, "let the sewers be ventilated as they may, either by open gratings in the streets, or by the rain water pipes in the houses, or by the pillars of the gas lamps, or by tubes carried up at the landlord's expense from the drains of every house, or by especial shafts in the public streets—in fact, let the gases go out of the sewers how they will, and where they will, you have but to place a small box containing a few pennyworths of charcoal in the course of the draft, and the purification of the air will be complete. As far as we know, the strength and the endurance of this power is almost unlimited, so that when once the air filter has been set up, it will last continuously for years. Its action also upon the draft cannot be particularly injurious; and I have no doubt that the temperature of the sewers, and the agencies which are now at work in circulating the air, and ventilating them, will be sufficient to keep up a current of foul air through the filters; and if these were multiplied to a large extent, the friction of the gases upon the charcoal would be reduced to an insignificant amount."

Acting on this recommendation, and a report from the engineer on the practical capabilities of the suggestion, the court decided that experiments should be made. The district experimented upon is in the eastern portion of the City of London. It includes a space bounded by Bishopsgate-street on the west, from Cornhill to Wigmore-street; by Middlesex-street and Somerset-street on the east, to the City boundary; and by the Minorities and then by Leadenhall-street to Cornhill on the south; the whole of the main thoroughfares above named being included in the area. It comprises a space of about fifty-nine acres, with about 1,700 houses and about 14,000 inhabitants. The total length of sewers is 25,587 feet, of which 2,081 feet are pipes; the remainder are constructed of brick, varying from 3 feet high by 2 feet wide, to 5 feet high by 3 feet wide, internal dimensions. There were two varieties of mechanical arrangements adopted for applying the charcoal; one consisted of one large sieve with compartments, the other of a series of trays for holding the charcoal, and were so constructed as to be capable of being readily removed from the frames into which they fitted.

In conducting the experiments attention was directed to the following points:—1st. The deodorising power of the charcoal. 2nd. The length of time that the same charge of charcoal will continue to deodorise the sewer gases. 3rd. The effect the air filters have on the ventilation and temperature of the sewers. 4th. The exact cost of the experiment, so as to obtain data from which to estimate the probable expense of the process if it were applied to the whole city, or even to the metropolis.

The deodorising power of the charcoal has been satisfactorily proved to be complete. Not only have there been no complaints from the public of stenches from the ventilating gratings, but it has been ascertained by actual observation that the odour of the sewer gases is not perceptible when they have traversed the charcoal.

As to the period for which the charcoal will detain its deodorising powers, there is not yet sufficient proof. It appears to lose much of its power when saturated with water, and as the trays were not in the experiment entirely protected from rain, it was found necessary to recharge them about once in three months. It is thought that if the charcoal could be kept dry it would not require renewal oftener than once in a year.

With respect to the cost of the process:—The expenditure incurred in fitting up 104 ventilating shafts was £918 18s. 5d., which is at the rate of about £8 16s. 8d. per ventilator. An experiment is necessarily more costly than an established system, and it is considered that a much less sum than this may be taken as a fair average of the probable expense of extending the process to the whole of the City.

The total expense of reparation and renewal of damaged trays, frames, and coverings, averaged 16s. 6d. per ventilator per annum. The cost of supervision, supplying, and changing the charcoal, was 8s. 9d. per ventilator, making together £1 5s. 3d. per ventilator per annum. The very large cost for reparation was mainly attributable to the repeated breakages of one class of apparatus used, which is not found to be capable of standing the severe traffic of the City thoroughfares.

* 30,000,000 gallons, equal to 300,000,000 lbs., or 133,928 tons.

The general conclusions arrived at from these experiments, and from the consideration of collateral evidence are—that dry charcoal in the presence of atmospheric air is a powerful means of destroying the mephitic gases and vapours of sewers and house drains; that the charcoal filters may be used with efficacy in the course of the air channels from the drains and closets of houses, as well as in the ventilation of the public sewers; that in applying the charcoal those contrivances should be used which offer the least resistance to the free passage of the air; that the situation of the filters is best when the charcoal is protected from wet and from dirt, and is easily accessible; that from the ascertained efficacy of charcoal in destroying the dangerous emanations from sewers, the system may be generally applied with great advantage; and that from the experience derived from this extensive practical inquiry, the expense of the system might be considerably reduced below that indicated by the cost of the experiment.

METROPOLITAN BOARD OF WORKS.

THE usual weekly meeting of this body was held on Friday, at the Offices, Spring-gardens; JOHN TWAINES, Esq., the Chairman, presiding.

The Proposed Road Across Hyde-park.—The Board received a report from the Committee on the Covent-garden approach, &c., submitting plans and estimates for a proposed road across Hyde-park, and recommending—

That Mr. Cowper, First Commissioner of Works, be informed that the proposed road through the park would, in the opinion of the Board, be a great public convenience during the Exhibition, and to the localities in its vicinity.

That the Board, however, with every desire to meet the views of the First Commissioner and the public, as to this road, regret they have no funds at their disposal to effect this great public improvement; they will, however, be quite prepared to make the same if Parliament will place at their disposal funds other than those derived from direct taxation for metropolitan improvements, &c.

Mr. LEGG moved the adoption of the report.

Mr. HUGHES seconded the motion.

It appeared that it was proposed, amongst other plans submitted, to form a road (which would be unattended by any difficulty in reference to Crown rights) from Lancaster-gate along the new walk across Kensington-gardens, at an estimated cost of £32,000.

Mr. BAZALGETTE, the Engineer-in-Chief, stated that this proposed road would be 70 feet wide, the average depth 10 feet, but under Rotten-row it would be increased to a depth of 18 feet, and thence it would rise to the level of the Kensington-road by an incline of 1 in 20.

Mr. BENNETT moved as an amendment—

That the Board, having an objection to any road from Bayswater to Kensington-gardens that would destroy the privacy of those gardens, declines to take any steps towards the formation of the said road.

The CHAIRMAN decided that this was not an amendment upon the motion, and consequently could not be put to the Board.

Mr. LE BRETON then moved the following amendment—

“That this Board is of opinion that a road across Hyde-park, from Victoria-gate to Kensington-gore, would greatly facilitate the public traffic, and would be an important metropolitan improvement; and having considered the various plans submitted to them by the direction of the First Commissioner, approves of the plan No. 5, for forming a new road along or near the fence of Kensington-gardens, crossing the bridge over the Serpentine on a level, at the estimated cost of £27,526; and this Board is prepared to undertake the making of the road, provided the Treasury should be empowered by Act of Parliament to transfer to this Board the balance of the coal dues which the Corporation of the City of London are about to pay over to the Treasury; but if it should be considered necessary hereafter to widen the bridge across the Serpentine, such widening should be effected as a park improvement.”

This amendment was lost.

Mr. ROCHE then moved, as another amendment, the following addition to the report of the Committee:—“Or will authorise to be paid over to the Board the balance of the coal dues which the Board understood is about to be paid to the Treasury by the Corporation of the City of London.”

This amendment was eventually withdrawn.

Mr. CRELLIN moved, as another amendment, that the latter half of the last sentence in the Committee's report be omitted.

Mr. HALL seconded the amendment, which was lost.

The original motion was then put, and carried by a majority of 27 to 7.

The Embankment of the Thames.—The CHAIRMAN stated, in reply to a question from a member of the Board, that the First Commissioner of Works had promised that the Board should be in possession of the plans for the embankment of the Thames on that day week.

Utilisation of the Sewage.—The next subject set down for the consideration of the Board was a report from the Main Drainage Committee, stating that the Committee entertain very favourably the proposition for dealing with the sewage of the northern area of the Metropolis, contained in the communications from the Hon. William Napier and William Hopk, Esq., and recommending the Board to assent to the principle of a concession of the sewage for the term of 50 years, provided the requisite authority be granted by the Legislature to the Board, and subject to the introduction of all necessary clauses in the Bill for the protection of the Board and of the public interests confided to them, and for insuring the fulfilment by the Company of the obligations undertaken by them, and to hear and determine upon certain motions thereon, of which notice had been given. In consequence, however, of a notice of motion respecting the utilisation of the sewage of towns, which was given the previous night in the House of Commons, by Mr. Brady, it was moved “that the consideration of this subject be adjourned until the Committee of the House of Commons (to be appointed with the sanction of Government) on the utilisation of the Sewage of Cities and Towns has made its report.” The motion was seconded and carried by a majority of 20 to 9.

IMPROVEMENTS IN RIO JANEIRO.—A prospectus has been issued of the Rio de Janeiro City Improvements Company, with a capital of £850,000, in shares of £25 each. The Company have a concession from the Brazilian Government for draining the City of Rio de Janeiro on plans of Mr. Gatto, approved on behalf of the Brazilian Government by the late Sir W. Cubitt, Mr. Robert Stephenson, M.P., and Mr. Rendel, and which stipulates an annual payment to be made direct by the Imperial Government to the Company of £5 5s. per house. It is said that an absolute contract for the work and its subsequent maintenance has been entered into by Messrs. Brassey and Co., on terms which, after providing for 7 per cent. interest during construction, will leave a permanent net divisible profit to the shareholders of 8½ per cent.

“LUDDITES.”—A “trades' union” outrage of a violent nature was committed in Chelwood, Manchester, on Saturday night. The object which had offended the union men was a brick-making machine, of the productive powers of which a most glowing account is given. The blind opposition of the brickmakers almost warrants the quality of the machine, and for some time past the brickmakers have been threatening all engaged in the work. A coffin was actually sent to the home of one of the men belonging to the place. On Saturday an attempt was made to blow up the machine, but, fortunately, the attempt was only partially successful.—*Civil Service Gazette*.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of this body was held on Monday evening; Professor KERR in the chair.

Mr. T. HAYTER LEWIS, Hon. Secretary, read the minutes of proceedings at the last meeting, which were approved of and confirmed.

Donations.—Amongst the donations announced were the following:—(From the Royal Society) Proceedings of the Royal Society, Vol XI., No. 47; the Royal Engineers, being remarks on their duties, with suggestions for greatly increasing their numbers, and thus rendering the efficiency of the British Army complete (pamphlet 8vo., 1862); A Practical View of the Sanitary Question, being a General Report of the Proceedings of the Local Board of Health for the Parochial District of Regent-square Church, St. Pancras; *Revue Générale de l'Architecture et des Travaux Publics*, par M. César Daly, Architecte; the Pictorial Handbook of London; Remarks on Ventilation, with Extracts from Official Reports on the Combination of the Ventilating and Warming System, Van Hecke, by B. Wilson Weatherby Phipson, C.E.; (from Mr. Cole), three photographs, part of the north aisle and transept of the Duomo, Milan, and parts of the front of the Duomo, Milan; (from Mr. Rawlinson, C.E.), A Report of the Completion of the Public Sewage Works in the District of West Ham. On the motion of the CHAIRMAN, a vote of thanks was passed to the donors.

New Members.—The following gentlemen having been balloted for, were duly elected:—Mr. Edward Swansborough, 6, Great James-street, Bedford-row; and Mr. Thomas Henry Watson, 9, Nottingham-place, W., as Associates.

Healthy Dwellings.—The meeting then proceeded to resume the adjourned discussion on the paper read four weeks ago by Mr. HENRY ROBERTS, “On the Essentials of a Healthy Dwelling and the Extension of its Benefits to the Labouring Population,” and which has been fully reported in our pages.

The CHAIRMAN said it was arranged that the adjourned discussion on Mr. Roberts's paper should be resumed by Mr. Godwin, upon whom he, therefore, called to address the meeting.

Mr. G. GODWIN said the gentlemen present would recollect that Mr. Roberts's paper was divided into two parts, the first portion bringing together what were considered the essentials for a healthy dwelling, and the second portion gave a statement of various efforts that had been made, mostly by associations, to extend the advantages of healthy dwellings to the labouring classes. If the whole of the first part of the paper of Mr. Roberts, which had since been printed, had been read when it was before the Institute, probably the members of the Institute would scarcely have thought it necessary to carry the subject further. Mr. Roberts had, with much ability and zeal, devoted many years to this subject, and by the publication of pamphlets and papers of great value, both in this and in foreign countries, on the sanitary question, he had entitled himself to the gratitude of every one having an interest in the subject, and that, he believed, ought to mean every one. The paper which Mr. Roberts had read to them a few weeks ago, as it appeared to him (Mr. Godwin), formed an additional claim on their gratitude to that gentleman. Nevertheless, he was quite willing, if the meeting thought it desirable, to open the adjourned discussion; he saw present many gentlemen interested in sanitary improvement, and he had no doubt the discussion would lead to advantageous results. They could not yet give up generalities he was afraid, though Mr. Chadwick at the last meeting gave expression to an opinion that it was time they did so. He believed with Mr. Chadwick that it was time, but the public was not sufficiently instructed or awake for the advocates of sanitary improvement to give up those general observations which were calculated to induce a strong public opinion in the right direction. There was a consequent connection between wrong structural erections and disease. They had only to look for example to the parish of St. Pancras, where in one district the average deaths were fifteen in a thousand; and in another district, twenty-three in a thousand; or take the parish of St. James, where in one district, twelve out of every thousand died, and in another district twenty-three out of a thousand died. When it was found that certain houses furnished a regular supply of fever cases, and that such supply stopped when structural improvements were made, doubtless such a cause of disease would vanish, and surely they ought to ascertain the sanitary condition of the houses not only in London but in the large cities and towns of England. And many must have seen, with him, houses in such a condition that to retain in them either health or virtue was impossible. He had given descriptions of rooms where fifteen or sixteen persons were sleeping without means for the escape of foul air or entrance of the fresh air, and where it was impossible for the body to resist or throw off the attacks of disease, and to perform its proper functions. The greatest advantages, there could be no doubt, arose from due attention being paid to sanitary arrangements, as might be seen in the case of model lodging-houses. After referring to the excessive mortality in the hospitals at Scutari, and to the lower rate of mortality in hut shelter in the field, Mr. Godwin proceeded to remark that health was very materially affected by structural arrangements. The startling effect of deaths in the army took every one by surprise, when it was found that the mortality amongst the Guards exceeded that amongst those engaged in unhealthy occupations, but that excessive mortality had been diminished by improved sanitary arrangements. He then further remarked that the probable sites of epidemics could be pointed out, and a striking illustration of this was given in a little book entitled “London Shadows,” which afforded an undeniable instance of the existence of nuisances which led to disease, and which nuisances might be got rid of, and thus a diminished rate of mortality secured. That was lately shown very forcibly by newspaper accounts on the occasion of the national loss incurred by the death of the Prince Consort, and it was a statement that seemed to strike deeply into the minds of a large number. It was hoped that such statements would be attended with good effect, and lead to the improvement not only of the cottage of the labourer, but the dwellings of all classes of the community. “To drain and pave means raise and save,” but some misconception and disappointment had occurred through the supposition that drainage alone was necessary. It was quite true that drainage effected a great deal, as might be found from official returns made in reference to places where an effective drainage had been carried out. But much more was requisite. Of the evils of cesspools it was quite impossible to speak too strongly; it startled one to see those cesspools creep up as they did sometimes. The condition of London at one time in this respect must have been something frightful. No less than 5,000 cesspools in the City had recently been taken away, and what remained was enough to startle one. Amongst the existing evils to be complained of, in regard to sanitary improvement, were bad foundations, thin and porous walls, defective drains and traps, want of ventilation, non-supply of pure air and the non-removal of bad, want of pure water, wasteful means of heating, smoky chimneys, want of light—a legacy of the late window tax—dark rooms and bad

ventilation, and defective paving of yards and areas. As to the excessive cost of dwellings for the poor, in respect of dampness it would be a great boon if they could in all cases obtain a layer of concrete over the whole site, and in many cases it would be desirable to have a layer of asphalt. Mr. Godwin then referred to a number of inventions for promotion of sanitary improvement, including those by Boyd, Jennings, and others. After the reading of Mr. Roberts's paper that night month some discussion took place as to the desirability of having non-absorbent bricks, and it was then shown that the difficulty which would have to be experienced in that respect would be the making of such bricks adhere to the mortar. There was, however, another difficulty, and that was the coldness inside the house caused by the use of a non-absorbent material there. Thus, they should endeavour to get a brick which would be non-absorbent outside and absorbent inside. In the South Kensington Museum there was a very considerable collection of building materials, the study of which would be found of great advantage to those who were looking at hollow bricks and other matters, and be found valuable examples to those interested in sanitary improvements. The injurious effects of damp in cottage and other dwellings were not, he was sure, sufficiently considered or thought of. He and others knew rooms where books became mouldy and linen damp, and yet they were inhabited by people who expected to enjoy health in them. The speaker then proceeded to dilate on the injurious effects of bad foundations, bad drainage, and other evils, which might account for the low state of health of the inhabitants of thousands of houses. There were thousands of houses growing up round London with which architects had nothing whatever to do; it was the rarest thing in the world that an architect had been engaged on those houses, except to look to them on behalf of the ground-landlord. Even in many cases of the erection of houses of a better character, upon which an architect was employed, they all knew that if the architect were to attempt to introduce an improvement, and it turned out to be not so beneficial as was anticipated, the whole responsibility would rest on the architect, and if the gentleman who built the house or houses was a litigious man he would probably bring an action for damages against him, and that difficulty led many architects to go on in the old jog-trot style. He did not know whether it ought not to be the duty of the Government to insist on every house being certified by a proper authority before it was inhabited. He hoped that gradually more stringent rules would be provided, that the Building Act would be improved, and greater powers given under the Metropolitan Improvement Act, so that persons might be assured on going into houses that they were not going into disease, if not certain death. The three sanitary clauses in the Building Act, relating to cellar dwellings, rooms on the roof, and the area of 100 feet behind each house, had been failures, owing to the ease with which they were evaded. As to sleeping in cellar dwellings, the violation of the provision of the Building Act in regard to that ought to be thrown under the management and care of the inspector of nuisances or the parish surveyor, the district surveyor being simply called upon to show that such rooms, if slept in, were not proper places to have been slept in. In respect of pure water, they found in every house, or nearly so, that the present supply was most insufficient. The Thames water, though it was pretended to be filtered, was impure, the water we had was anything but satisfactory, and the influence of impure water in causing disease was quite undeniable. Some people complained of the expense by which an abundant supply of good water was attended, but the Romans did not care what sums of money they spent in bringing the best and purest water to their cities. Then, again, the supply of water should be constant. In many districts such was not the case. In his own district he had known thirty houses to be without any supply of water from Saturday afternoon to Monday morning. Such being the case, how could the people living in those houses pretend to be clean? It was out of the question, and then to be in dirt became a habit with them. As to the means of taking water to houses, we went on using lead pipes, although it was known that such means of taking the water to houses was injurious, and frequently actually poisonous. If that could be thoroughly understood, if people would dismiss all doubts on the subject, if they would see that lead pipes were bad, and that even pipes tinned were bad, if all that was but thoroughly understood, we should soon get a pipe that would answer the purpose, and that was very much wanted at the present moment. As to the traps of our drains, nothing could be worse in a general way, for they were constantly ineffective. In some houses in his district in Islington the traps were broken back and front, a poisonous smell was produced in consequence, and the result was that there were sickly children and thin emaciated mothers, as they were being poisoned. This subject was of immense importance, and a good suitable trap was of the highest consequence. There were several on the table, and he did not pretend to say that one was better than another. (The speaker then proceeded to explain the peculiarities of the traps on the table). What was wanted was a perfect trap; the traps in general use at present were simple disguises. The ventilation of the drains outside the house was of the greatest importance; the use of the rain-water pipes, which had been often recommended, he could not himself strongly recommend, as he could see cases in which they would be injurious. He thought the use of charcoal had been shown to be very satisfactory. There was one point nearly altogether neglected in our houses, yet it was one of the most vital importance, and that was the means of admitting fresh air involuntarily without a draught, and the means of taking away the foul air. Every one should insist on that being done. Half-a-dozen schemes had been proposed, amongst others those of Boyd, Jennings, Taylor, Doulton and Watts (all of which he explained to the meeting from specimens of the different schemes on the table.) All those arrangements were simple and of vital importance in bringing in fresh air and taking out the foul, without opening windows or the door. And he called upon the public to use such means, and upon architects to assist the public in the use of them. Then, as to grates, that was a very large subject—indeed, too large for him to dwell upon. The waste of fuel that was going on in respect of some grates was perfectly preposterous. They ought to understand what were the right principles of stove-making, and adopt that scheme which would be suitable in all respects. They ought to know by experience what were the grates by which they could effect a saving. The open fireplace they all desired, they did not want to get rid of that which was a focus of enjoyment; but with bad grates they got smoky chimneys. He then referred to an invention of Mr. John Billing for the prevention of smoky chimneys, which had been used in many places and found effective. A great deal could be said as to the necessity of reducing the cost of houses for labourers, and much might be done by the use of machinery in lowering the price of cottages for the working classes. If, as in the case of ship-building, windows, doors, and roofs were all made of a certain pattern and number, that could be done much cheaper by machinery,

as a matter of course, and then there might be good, healthful houses, made after the best plan, and at a cost that would allow a fair return to the owner. He did not mean that that should be applied to ordinary buildings, but to cases where healthful accommodation was required for the working classes. Then, again, concrete building seemed to him to have been overlooked; he thought concrete walls might be erected in cottages, which would prove to be much better than walls of bad bricks. The subject of agglomerated houses would require a night for themselves, and he would not then discuss it. Many a house was made as if it was to be occupied by one family, whereas it would be occupied by three or four families. Now houses ought to be arranged to that end as in Scotland, where people lived in flats, and where each family had all the accommodation and requirements which a whole house stood in need of. The effects of evil arrangements in dwellings, when they did not actually result in death, were very sad. Evil sanitary arrangements led to a low state of health, and that was the chronic condition of thousands in this country. The laws of health ought to be taught to every child, from the ragged school upwards, and such teaching would naturally lead to the lowering of the rate of mortality throughout the kingdom. It was scarcely possible to calculate the amount of misery, remorse, and crime produced by unhealthy houses, which in all cases had a most injurious and dispiriting influence on the inmates. We wanted, too, more colouring in our houses, more pictures, and more prints, which had a beneficial effect on the spirits, and the same argument would apply for the adornment of towns.

Mr. CHADWICK, having been called upon by the Chairman, said there was one point to which Mr. Godwin had alluded which he wished to offer an observation upon. The previous speaker seemed to object to the non-absorbent surface within a dwelling. Now, there were houses built with a cement that was equivalent to a non-absorbent surface, and rooms painted with oil painting were themselves non-absorbent. But there were many rooms where the whole surface was, so to speak, non-absorbent. Now, they had never heard of any evil arising from that sort of surface in the way of cold. The experience of the absorbent surface was perceptible to the nose in hospitals and other places, and the sanitary officers had felt it very much. With respect to the absorbent surface of a wall, he thought they had had a great deal of experience. In his opinion one of the most healthy houses they could construct would be of glass, on the double-window principle. To have a surface non-absorbent was no safety as to cutting off dampness from below. There were some very important experiments referred to by the Commissioners for inquiring into the warming of buildings, as to the effect of a double window; and the experiments showed that about six inches of space between the outer and the inner window was quite adequate for the non-conducting power. That gave a very important result for the hollow brick, because the hollow brick, properly constructed, would be like a double window. One ground he strongly advocated was the use of hollow brick walls, so that there might be obtained a much thinner wall. A 9-inch hollow brick wall would be warmer than an ordinary wall of greater thickness—16 or 18 inches. He thought economy as well as health would be promoted by applying the hollow brick wall to cottage structures as well as the middle-class buildings. The hollow brick could be obtained much harder burnt than the common bricks. The floors should be as much as possible non-absorbent, and the walls too. Several noblemen and gentlemen had made experiments with hollow brick walls in the construction of cottages, and the result was found to be very beneficial. A report had also been made in favour of the use of hollow bricks, on the ground of economy.

Mr. FOWLER said, that, living now in the country, he had had some opportunity of taking notice of matters that had been under consideration that evening. One particular circumstance to be observed was the great diversity of situation, of materials, and other matters affecting the erection of cottages. In various parts of the kingdom the cottages must necessarily assume a different form and a different construction, because as cheapness was so very important an element in the matter, it was found requisite to take such materials as were at hand, and it would be very desirable that gentlemen living in the various districts should have hints communicated to them, so that they might be able to make the most of the materials at their command. They spoke there chiefly of bricks, but in many instances in the country bricks were not to be had. For instance, in Devonshire, cob—which was loam mixed up with a certain portion of straw, made consistent, and carried up in layers of considerable thickness—was very extensively used in the erection of cottages. He would venture to say that, when erected, there was no cottage or house more comfortable than such a mud dwelling; from the circumstance of the great thickness of the walls, and the non-conducting qualities; such dwellings were, in summer, cooler, and, in winter, warmer, than the ordinary houses. Such houses were generally covered with thatches, and the materials together formed a very comfortable dwelling. The having of non-conduction by means of substantial buildings was very desirable in all instances, as far as could be afforded. As to situation, there was in his neighbourhood a poor woman who lay sick for years, and, on going into her cottage, a person had to go through a mass of fermenting matter kept there for the farmer, close to the cottage door. That poor woman lay in bed for years, and fell into an emaciated condition, but it never occurred to anybody what the cause was. Nothing, however, was more probable than that she was sick and dying from a cause that was removable. Representations were made to the farmer on the subject, but nothing was thought of them. Attention should be called to such matters where they occurred, for many deaths had arisen from such causes. It was not merely the structure of the house they had to consider; it was as important to see that the house was not rendered unhealthy by circumstances surrounding it as it was to pay proper attention to the construction of the house itself. There was only one other point he would venture to say a word upon, and that was in regard to chimneys and the conduction of smoke. They should never forget this, that the great thing to be looked to in reference to smoke was to keep a balance of air, and the balance of air should always send the smoke up the chimney. If the chimney was kept warm that would always be the case, but if it had a cooling influence there would be a down draught. The flue should be kept warm, and then the current would go up. He was very glad the Institute had devoted so much attention to this subject, which was one of great importance, and hoped the result would be that they would put the subject in such a manner before the public that they would be able to profit by it.

Mr. H. RAWLINSON said the subject under consideration was a very wide one. Attention should be paid to the sanitary condition of the dwellings, not only of the poor, but of the wealthy also. He had no wish to throw stones from a glass house, but he was, however, bound to say that the subject of sanitary improvement had not been considered by any person in general practice as an

architect or engineer except within the last twenty years. He then proceeded to state that he had had the honour of being called on to examine and report on the condition of Windsor Castle, in order to see if there was anything in that great structure to account for the recent great national loss in the death of the Prince Consort. In 1824 the Legislature voted £300,000 to make Windsor Castle a fit residence for George IV., and an architect was called in for the purpose. At the end of the reign of William IV. upwards of three-quarters of a million had been expended on the building. In 1844 there were found fifty-one cesspools beneath the basement of the building, ramified by drains in all directions, and there was not one window in the grander part of the palace that would open in its upper part. In 1844 plans were made, the sewers were carried out, and he was happy to inform the meeting that, after going all over the Castle, his opinion was that Windsor Castle now stood the most complete house in this country, and probably in any other, in its sanitary arrangements; and he had no hesitation in saying that that, in a large measure, was due to the great man the nation had recently lost, and who, when he became the Consort of the Queen, took up the sanitary question, worked it to the utmost for the benefit of the poorest as well as the rich, and paid the most intimate attention to the drainage from 1844 down to the time of his death; and they might be gratified on finding that, humanly speaking, there was no cause in Windsor Castle to bring about the Prince Consort's death. —[Hear, hear.] It had not, he believed, been a part of the province of the architect to make the drainage a subject of study as well as the superstructure. He scarcely knew a nobleman's house in the country that had proper sewers, those employed being, in fact, great retorts of poisonous gases. And, with regard to the houses at the west end of London, the probability was that there were five per cent. or more of those great new houses in which the drains and sewers, though both executed, had no connection. There had been no proper connection made between the two; his own house went on in that state for three years. There was one nobleman's house in the country—Bowood, the seat of the Marquis of Lansdowne—in which some portion of the drainage was 300 years old, and nine-tenths of the drains had never been connected with the sewers underneath the house.

The CHAIRMAN inquired if Mr. Rawlinson's remarks about noblemen's houses in the country having improper drains referred to structures erected within 50 years.

Mr. RAWLINSON said they did, and he might say they applied to buildings erected within twenty years. The arrangements of the sewerage of the Houses of Parliament was as bad as it could be; it was a longitudinal sewer down the centre of the building, tide-locked every twelve hours. Arrangements for proper ventilation in houses were absolutely necessary. He then amused the meeting by stating that he had paid a visit to a water-closet belonging to the rooms of the Institute, which he found to be badly ventilated. Closets, again, ought to be put against external walls, instead of internal walls, as was the custom at Edinburgh and Glasgow, and which was a bad arrangement. After advocating external ventilation, he proceeded to say that, as to ventilation and the arrangement of houses, they had been told that instinct and nature guided them; but Mr. Godwin had shown that instinct became entirely blunted by use, and people exposed to inconveniences and nuisances long lost all feeling of smell. The question of the sanitary condition of cottages in this country was one of national importance, and it was one which he sincerely hoped the Legislature would take up sooner or later. The Building Act was a dead letter, and so was the Common Lodging-house Act of Lord Shaftesbury, for it could not be brought into play except in cases where tramps slept for a night. The speaker then dwelt on the overcrowding of houses, as was the case at Plymouth, Falmouth, Portsmouth, Newcastle-upon-Tyne, and other places, where people lived in tenements, and the houses were divided and subdivided for the accommodation of different families. He next referred to the pigsty question, and observed that more human lives had been lost in this country by pig-keeping and pig-feeding than in all the battles we had fought in foreign countries. The keeping of the pigsty led to fever and other diseases, yet the poor people would consider it the greatest possible hardship to be deprived of their pig. Now, should they not be saved from danger brought on by their own ignorance and self-will? The question of cottage accommodation was one of great importance, and he hoped they would all of them put their shoulders to the wheel in order to improvement; and he trusted that the Institute would take up the great sanitary question in its full bearings—drainage, sewerage, ventilation, lighting—and also the cheapness of structures for the labouring people, in order that we may have a healthy nation and a more happy and more loyal people.

Mr. T. HAYTER LEWIS referred to the statement made by Mr. Rawlinson that in many large houses the drains were not connected with the sewers. Now, the making of such connection was not in the province of the architect, but of the authorities of the Sewers Office, who charged for making the same. Therefore the statement about the non-connection between the drains and the sewers ought to be mentioned at the Sewers Office.

Mr. RAWLINSON said he made the statement in all candour and sincerity, and he was afraid that the mischief arose from two parties being connected with the matter. In all his arrangements respecting sewers, and he had made many miles of sewers, he made an entrance for a branch connection, and no fee was charged for any connection.

Mr. ISAACS.—He must say that a better paper, or one containing a larger amount of facts on the subject under consideration, could not have been presented to the Institute. Though he was not prepared to go the length of some members as to the total efficiency of sanitary measures in preventing disease of every type, there was no doubt that sanitary measures would, to a large extent, obviate the sickness and diseases to which the population of towns had been subject. He happened to have a portion of the sewerage of the metropolis under his charge, lying between Gray's-inn-lane on the west and Victoria-street on the east, and after a review of the operations of the Local Board of Health of that district, it was found that the sanitary measures had resulted in a reduction of the rate of mortality. He would suggest that the Institute should state some leading principles as to sanitary matters. The first evil to be avoided, he thought, was that of overcrowding, than which there was no other source more conducive to sickness and mortality. When whole families resided in rooms sickness and mortality followed. Great attention should be paid to the ventilation of a number of buildings erected, particularly low buildings, in close proximity to each other, and, again, too much attention could not be paid to the condition of the drainage and the water-closets. But unless there was provision made in the way of constant inspection of such buildings, however great the care in regard to

building and to providing proper accommodation, the conveniences were generally misused.

Dr. MILROY drew attention to the subject of the ventilation of rooms and apartments. The point was a strictly structural one, and he had hoped to hear some remarks from architects as to the mode of admitting fresh air into a room, and the mode for the escape of the vitiated air. Upon the latter point they were probably all agreed; the vitiated air rose to the top—therefore the opening for its escape ought to be at the top. But then came the point, where should the fresh air be admitted? He considered that was a point on which they ought to endeavour to come to some decision: for gentlemen would be aware that there had been conflicting opinions given by Government Commissions on that subject. He might refer to the opinion and advice given by the Sanitary Commission of the Army, and they recommended a model hut embracing the important subject of the admission of the fresh air and the escape of the foul air. In that hut the general principle was the introduction of the fresh or pure air towards the floor, or a few inches above the floor. Now, recently he believed that more than one report of the very opposite character was made; and it was the very diversity of opinion that made him keep to that one point—namely, in what part of a room, hospital, or chamber, where was the right place to introduce the current of the fresh air to take the place of the foul or vitiated air? It was of the greatest importance to keep a current of fresh air in rooms and hospitals at night. During the period from sundown to sunrise it was by far the most important thing to keep the apartment or chamber sweet, for this reason, that at least two-thirds of the attacks of disease occur during the night. Hence the great importance of maintaining the purity of the air during that time.

Mr. FOWLER (having been requested by the Chairman to give some account of the mode of ventilation adopted at the Fever Hospital), said, the ventilation of the Fever Hospital, conducted by Dr. Arnott, went on this principle: they did not trust to the currents, but the air was forced into the wards, not through small pipes, but through ducts that a man could creep through. The air was driven through a kind of culvert to the different wards; it was injected at the lower part of the wards, and forced out at the top. He took it, therefore, it was an important principle, for which he gave Dr. Arnott the credit, that a very moderate amount of mechanical power enabled them to secure a change of air, by driving out the foul and admitting the fresh, to obtain the great object of ventilation. They began the Fever Hospital by covering the ground with concrete, to seal up, as it were, all the foul emanations arising from what had been a laystall for cattle. That ground was sealed up by a layer of 6 inches of concrete over the whole surface.

The Hon. ARTHUR KINNAIRD, M.P. (having been called upon by the Chairman), said he had endeavoured to give attention to this sanitary question, and his brother, Lord Kinnaird, had made experiments on the very ground which had been alluded to that evening. He did not think they could give sufficient attention to sanitary questions; the longer he lived the more he saw of that vast city in which we resided, and the more he saw of the amount of building that was going on on every side, it seemed to him a matter much to be deplored that science, with all its progress, was not more adapted to our buildings. On every side they saw buildings run up, and yet no effort was made really to remedy those defects which experience had pointed out. Now, he did think meetings such as the present were particularly adapted to draw public attention to the matter, and he thought the more they had the benefit of the press throwing light on this matter, the more was London likely to be benefited by the improvements which had been suggested that evening. He was talking on Saturday to a gentleman who had built model lodging-houses in the neighbourhood of Bethnal-green, and he said that he thought after laying out a great deal of capital in building extensive houses of the description referred to, it was a very cruel case that those who built such houses got no help from the Legislature, and he further stated that the rating on his property increased to such an extent as to become a positive check on such improvements. Now, he thought there should be some improvement and alteration in that matter. The moment they improved the class of building they were subject to an amount of taxation which was a positive interdiction or check on improvements of that nature. He threw that out as a matter worthy of consideration by those present, and he thought the law ought to be changed in that respect, because they ought to encourage instead of discouraging such improvements.

The CHAIRMAN read an extract from a communication forwarded by Mr. Phipson, in which that gentleman stated that it was a mistake to suppose that the vitiated air always ascended.

Dr. MILROY.—The great object was to ascertain from architects where was the right place to bring in the fresh air.

Mr. ROBERTS (author of the paper which led to this discussion) said if the buildings for the working classes were arranged on the open gallery system instead of the close corridor system, they would not be subject to the taxation which had been referred to by the Hon. Mr. Kinnaird. That had been decided by the judges at chambers, and that was an important fact which ought to be well considered.

Mr. WILLIAM WHITE said in reference to the building of cheap cottages in the country, he had adopted, with very great advantage, quarter bricks for 12-inch walls. In some parts of the country it was usual to build with a common earth, without water, without lime, without sand, without stone, but simply rammed in, and it formed a good substance. What he referred to was a loamy earth or gravel. He had built the walls of a house in this manner with as little cost as the carriage of the stone alone would have been. With regard to drainage, he understood that something was to be done as to waterclosets and cesspools. There was a clergyman in Dorsetshire who was advocating the mixing of heaps of rubbish and soil of every kind at the backs of the cottages; and it had been ascertained that the drying common vegetable mould, and pulverising it, would absorb from drains all the effluvia and offensive particles, and the same earth could be used for three or four months without being unduly charged with offensive matter.

Mr. EDWARD ROBERTS referred to the subject of ventilation, as to where the fresh air should be admitted and where the vitiated air should go out. The foul air did ascend, and there was no doubt all that made a room uncomfortable descended. There should be admitted a sufficient quantity of fresh air at a proper point, and he had found it convenient to admit it by a vertical tube above the heads of the persons in the room. He found the mode of ventilation he had adopted at his offices to be very effective.

This closed the discussion, and shortly afterwards the meeting separated.

ARCHITECTURAL ASSOCIATION.

An ordinary meeting of this body was held last Friday evening at the rooms in Conduit-street; A. W. BLOMFIELD, Esq., M.A., the Chairman, presiding. Mr. BLASHILL, in the absence of Mr. Arthur Smith, hon. secretary, read the minutes of proceedings at the last meeting, which were approved of and confirmed.

The Library.—In answer to Mr. BLASHILL, Mr. C. H. F. Lewis stated that the library in course of formation was to be a lending one, and that subscriptions were being received in aid of binding the books, the committee of the Association having undertaken to provide cases for the same.

The CHAIRMAN then announced that in consequence of the absence of Mr. B. A. C. Herring, who was to have read a paper that evening, it would be requisite to adjourn the meeting.

The meeting was accordingly adjourned.

DECISIONS IN THE COURTS.

POWER OF VESTRIES TO REQUIRE WATER SUPPLY TO CLOSETS.

The Vestry of St. Luke's, Middlesex, Appellants, and Lewis, Respondent.—*Court of Queen's Bench.*—This was a case stated by one of the police magistrates of the metropolis, under the 20th and 21st Victoria, cap. 43, for the opinion of this Court, upon the question whether the magistrate ought to have made an order upon the respondent for the payment of the sum of £12 10s. under these circumstances:—

It appeared the respondent was the owner of the premises in John's-place, Arthur-street, in the parish of St. Luke, Middlesex, built before the passing of the Metropolis Local Management Act (the 18th and 19th Victoria, cap. 120), and he had been summoned before one of the police magistrates at Clerkenwell, to show cause why an order should not be made, under the provisions of the Metropolis Local Management Act, requiring him to pay the vestry of the said parish the sum of £12 10s., being the expense of certain works executed by the said vestry upon the said premises in John's-place. The respondent appeared in answer to the summons on the 19th of December, 1860, and, in the result, the magistrate declined to make the order. It was proved before the magistrate that the respondent was the owner of four houses in a court, called John's-place, and that the houses had two privies attached to them. In the early part of the year 1860 complaints were made, and the vestry served upon the respondent a notice to do certain works, which he complied with, so far as to fix pans to the closets, but not in providing water supply. On the 14th of July, 1860, the surveyor of the vestry gave the respondent notice, and then proceeded to inspect his premises, and opened the drains passing under the footway pavement and connecting the privies with the sewer, which were found to be choked and blocked up. The drains were cleaned and put in order at the expense of the vestry, and on the 21st of August the vestry served upon the respondent a further notice, requiring him to provide water supply to the two privies within 28 days to the satisfaction of the vestry; and that in case of his refusal or neglect the vestry would cause the same to be constructed, and would proceed to recover the expenses in the manner provided by the Act. No attention was paid by the respondent to this notice, and the vestry, on the 26th of November, 1860, served upon him another notice of their intention, after 24 hours, to enter the respondent's premises and execute certain works, which they accordingly did on the 1st of December. They then fixed a cistern on the roof of the privies, removing the roof, and also three courses of brickwork on the upper side or pitch thereof, for the purpose of procuring a level base for the cistern; and they also fixed the necessary plumbers' work for connecting the cistern with the pipes of the water company and with the pans of the closets, and fixed new seats in the privies. The expense of these works amounted to the sum of £12 10s., the payment of which the vestry then sought to enforce by summoning the respondent before the magistrate. The magistrate, however, was of opinion that, having regard to the Metropolis Local Management Act, and particularly to the 81st, 82nd, and 85th sections, under which the vestry professed to have acted, there was no power given to convert a privy into a water-closet, by providing water supply thereto, as had been done in this instance; but that, if the privy was not sufficient, the vestry should have required the respondent to make it so, and, on his default, the vestry was empowered, by the 81st section, to make it sufficient by doing such works as were required, and then to recover the expense so incurred from the respondent. The magistrate also stated that he thought he was supported in his opinion by the decision of the Lords Justices in the case of "Tinekler v. the Wandsworth District Board of Works" (27 L. J. Ch., 342). He accordingly declined to make an order for the payment of the £12 10s.; but, at the request of the vestry, he stated the present case for the opinion of this Court upon the question whether he ought to have made an order.

Lord Chief Justice Cockburn said he was of opinion that the decision of the magistrate was erroneous. The question turned upon the construction of the 81st section, which enacted that "if at any time it appear to the vestry or district board of such parish or district that any house in any such parish or district, whether built before or after the commencement of this Act, is without a sufficient water-closet, or privy, and asphalt, furnished with proper doors and coverings, and with other apparatus and works as aforesaid, the vestry or district board shall, in case the same can be provided without disturbing any building, give notice in writing to the owner or occupier of such house, requiring him forthwith, or within such reasonable time as shall be specified in such notice, to provide a sufficient water-closet or privy, and asphalt, so furnished as aforesaid, or either of them, as the case may require," &c. The respondent admitted that the vestry had the power to order a privy to be made sufficient, but he denied that they had the power to order a privy to be converted into a water-closet. His Lordship, however, thought the vestry or district board had that discretion vested in them by the 81st section, for it enacted that if "any house" should be "without a sufficient water-closet or privy," the vestry, or district board, should have power to require the owner or occupier to provide "a sufficient water-closet or privy," &c., "or either of them, as the case may require." It was reasonable also that it should be so, for there might be cases where the privy could not be so altered as to meet the necessities of the case. It might be that the buildings were so crowded that the only remedy might be the application of water to carry the soil into the regular sewer. Upon the whole, his Lordship thought the vestry ought to have that discretion, and that the Act of Parliament vested it in them, and that the magistrate ought to have made the order.

Mr. Justice Wightman was of the same opinion, and said the case of "Tinekler v. the Wandsworth District Board of Works" was distinguishable, because in that case the board had declared their intention to do away with all privies, and had issued a general order applicable to a number of houses without any regard to whether the privies were sufficient or not. But, in the present case, the vestry had decided that water-closets were necessary.

Mr. Justice Crompton was of the same opinion, but added that in some cases a question might arise, on the words "without disturbing any building," as to what amounted to "disturbing a building," and also as to who was to decide. His Lordship, however, agreed that the vestry had the power under the Act to order the supply of water.

The judgment of the Court was, that the case be remitted to the magistrate, with the opinion of the Court.

THE EXHIBITION APPROACHES.—One of the openings towards the International Exhibition, recently insisted on as an absolute necessity by Sir Richard Mayne, has been secured by the Chelsea Vestry. The passage from Eaton-square to Sloane-square will be widened, so as to be rendered available for the increase of public traffic by that line of road.

Reviews.

Journal of the British Archaeological Association.

THE last quarterly part of this Journal contains a paper on Lilleshall Abbey, by Mr. Edward Roberts, F.S.A. Lilleshall, it will be remembered, was one of the places visited during the Shrewsbury Congress. Mr. Roberts gives a plan of the remains, so far as they can be traced, and illustrations of a late Norman doorway, from the cloisters to the church, and of the south side of the refectory.

The church itself consisted of nave and choir, together about 225 feet long by 31 feet wide. There was a north and south transept; south of the latter is the sacristy, then the treasury, and south of that the chapter-house.

We believe that Mr. Roberts is now preparing for publication an elaborate and illustrated account of the interesting remains of Wenlock Priory, in the same county.

The Ecclesiologist.

FOR February, gives the concluding part of Mr. Street's lecture on "Italian Pointed Architecture," some notes on the works at Queen's College, Cambridge, and a statement of doings at Ely Cathedral, lately noticed in our pages. Mr. W. Burges contributes, in a letter, "Supplemental Notes on Florence," as addenda to his paper on that city; there is also a notice of All Saints' Church, Hawkhurst. If, in addition to this list, we mention photographs of an internal view and plan of Mr. Joseph Clark's Point de Galle Church, at Ceylon, a bird's-eye view of St. Mary's College, Harlow, by Mr. Withers, and notices of new churches, we shall include most of the purely architectural matter contained in the present number of our contemporary.

A Letter Addressed to Both Houses of Parliament. By E. W. OLDHAM, Senior. Knight and Co., Worcester.

THE author of this pamphlet claims to have produced the first practical plan for the Thames Embankment (in 1845), and, at the same time, a plan of sewer drainage, which it is contended is now being carried out upon wrong principles. It is not easy to see how the "Royal Sacrifice," referring, it is presumed, to the death of the late Prince Consort, is connected with, or in any way attributable to, our sewerage works, but the writer finds in it "a warning voice of the unspeakable and horrible effects that must certainly follow."

There is something, however, in a point on which the author strongly insists, the necessity of constructing sewers and drains water-tight in the upper as well as lower portions. It is asked—

How many scores of miles there are of the immense network of small drains running up small streets and backs of houses, and all these made above the water-tight point of the main sewer, and, therefore, exempt by law from being made in the smallest degree water-tight? Thus all the springs are running directly or indirectly into them; and all the wells of water below that point of level—I mean for a third part of the way up the main sewer—draw all their water directly from the sewer drains. Now, if they were made water-tight, such could not take place. Where I was living in London for many months, I have seen a drain blocked up at the outlet into the main drain, yet our pumps at the upper end of the streets kept us clear of all surface water: thus, the water in the well came from the pump to the tea kettle, thence to the closet, the drain, and back again to the pump, until we drank one day the excrements or sewerage of the preceding.

The Artizan.

THE January and February numbers of this work are before us, the latter giving, in a large folding sheet, and in a tabulated form, an account of the performances of six vessels under various circumstances. "Practical Papers for Practical Men" treats of bridge platforms, "Notes and Formulae for Engineers" gives a large amount of information, and there are some interesting papers on the Strength of Materials. The proceedings of the engineering societies are fully reported.

Mr. Tite's address on "Current Topics," delivered before the Institute last year, is concluded in the part for January.

Description of Edward Finch's Proposed Improvements in the Metropolis. Wilson: Royal Exchange.

ACCORDING to these plans, which were submitted to Lord John Manners and to the Board of Works, in 1858, and placed before the Thames Embankment Commission in 1861, the author proposes two improvements—one relating to the changes and improvements in the river Thames, the other to the disposal of the whole of the sewage of the city of London and its suburbs.

On looking at a map of London and its environs, it will be seen that the river Thames at Greenwich, at about Deptford-creek, makes a bend forming nearly a right angle; that it keeps on for nearly two miles till it gets to Limehouse, there it forms another sharp bend, then it goes on in an irregularly-shaped line for about 4 four miles until it gets to a point between Waterloo and Hungerford bridges; there another right-angled bend is formed; the river then goes on for about a mile and three-quarters until it reaches Nine-elms, there it forms another bend and goes on to Chelsea. These four bends cause the portion of the river extending from Greenwich up to Vauxhall-bridge to form three sides of an irregularly-shaped long square.

It is proposed to cut off this portion of the river, commencing at about Deptford-creek and terminating at about Nine-elms, and form it into an extensive lake or dock seven miles and three-quarters long. By putting gates across the river at a point a little above Greenwich, adapted for the largest-sized ships to pass through, and at the upper or Vauxhall end of this great lake to place smaller gates, adapted for barges, river steamers, and small vessels to go through. These gates or locks would be connected by masonry to the shores of the river on each side, and would retain the water in the lake always at one uniform level or thereabouts.

It is further proposed to cut an entirely new bed for the river, commencing a little above the upper gates of the new lake at about Nine-elms, and to carry it in a line as nearly as possible straight to Greenwich, and there to let it join the present river bed immediately below the lower gates of the new lake, at a point about Deptford-creek. This new river bed will probably cross the Kennington-oval, take the direction of the Surrey canal for some distance, and then go on to the point described; the entire distance will be a little under five miles.

With regard to the second portion of the plan, which consists of the collection, treatment, and disposal of the sewage, it is proposed to make, on the north side of the river, an intercepting main drain, that shall take pretty nearly the direction the river at present takes, and that shall catch all the main drains that now

empty themselves into the river. "It would be well to have it made of iron. It should be of good size, so that there may be ample room and to spare. At the point where this drain commences or takes its rise there should be a pipe laid from it to the great lake, which pipe should rise up in the lake to the surface; it should be fixed in a secure and convenient place, and should have a valve upon it, so formed that by turning a handle any amount of water may be allowed to flow from the lake down this pipe into the main intercepting drain. At the point where this drain terminates a pumping engine would be erected, and sluice valves made to open and shut, and from there a drain would go direct to the nearest point of the river Thames below the lower, or Deptford gates of the lake, to which it could be conveniently taken."

The end aimed at by this portion of the arrangement is to admit a stream of water into the main drain; to use this as the medium for carrying along with it expeditiously, and before it has time to ferment and decompose, all the sewage matter that is brought into it, and to carry this at a speed that will prevent any deposit of the solid matter held in suspension, and thereby, to a great extent, prevent noxious gases from being formed; and, further, not to let this diluted sewage rest, but, as soon as it arrives at the termination of this main drain, to lift it up to a higher level by means of the steam-engine, and then again deal with it as will hereafter be described.

Other parts of London would be drained somewhat similarly, the sewage being conveyed to and spread over a tract of land laid with porous drain-pipes, to carry off the liquid portion, leaving solid matter remaining. What is to be done with the latter is not said.

A Sketch of the Life of John Milton, Compiled with Reference to the Proposed Restoration of the Church of St. Giles, Cripplegate. Woodley, Fore-street, Cripplegate.

THE author, who does not allow his name to appear, urges the perfect restoration of Cripplegate Church as a memorial to the memory of John Milton, who was buried therein. We understand that the highest dignitaries of the Church approve the suggestion.

Some particulars of the church are given. Dedicated to Saint Giles, born at Athens, a great patron of the poor and disensed, it was built, according to Stow, in the year 1099.* "In the reign of William the Conqueror,† houses having been built east and west across the said gate (Cripplegate), a parish church was erected rather west from the gate, and is now on the bank of the town ditch." Stow further tells us, "That the church was at first small, but enlarged at divers times as the parish increased, when it was at length rebuilt." It underwent a fiery ordeal in 1545, but was speedily restored, and wholly escaped the conflagration of London in 1666. It measures 114 feet in length, 63 feet in breadth, and, originally to the roof, 32 feet; it is built of stone and brick. The pillars and arches are Modern Gothic.

The tower, now in ruins, is considered to be part of the original structure, and it may be inferred that by far the greater number of columns and pointed arches were also portions of the early foundation. In the west front of the tower was a large pointed window, now bricked up, and in the side walls are the jambs and heads of two similar, but smaller windows, also obliterated on the outside.

The Practical Mechanics' Journal.

THE current part of this journal continues the description of Mallet's method of mounting cannon, and a paper on the "Annealing Temperatures of Metals and Crystallisation Produced by Vibration." An article on sea-wall engineering treats of the Dymchurch wall of Romney-marsh. Again, we meet with the history of the sewing machine in its thirty-fifth part, bringing the subject down to 1860. There are several detailed notices of recent patents and reports of actions on patents. "The Mechanics' Journal" is conducted with spirit.

IMPROVEMENTS IN BUILDING, &c.

IN THE CONSTRUCTION OF BUILDINGS AND SHIPS WITH A VIEW TO THE EXTINGUISHMENT OF ACCIDENTAL FIRE THEREIN, AND ALSO THE VENTILATION THEREOF.—Dated July 22, 1861.—J. Beattie, South Lambeth.

This invention is carried into effect in the following manner:—The patentee places in or between, or connects with, the brickwork or other material of which the main building is composed, one or more main pipe or pipes of suitable metal, and of sufficient strength and bore, from the basement or ground floor to the roof or other part or parts of such building; and he has branch pipes of suitable metal, bore, and strength from such main pipe or pipes into each floor, and, if required, into each room, and he carries such branch pipes round the ceiling or other part or parts of such rooms, and other parts of the building; and he has perforations in such branch pipes, and moulth or roses, made ornamentally or otherwise. He also has suitable joints and cocks, or other apparatus, so that, when a fire has taken place in any or more of such room or rooms, the water can be forced by steam or other power from below through the main pipe and branch or branches into such room or rooms as required for the extinguishment of the fire therein. He also, in some cases, constructs fines in different parts of the building for the passage of water for cooling the walls and pipes, with requisite inlets and outlets. He also, at other times, forces or partially exhausts air, by means of a fan or other suitable apparatus, worked by steam or other power, through the main and branch pipes, for the purpose of ventilating the rooms of such buildings.

PREVENTING THE EXTENSION OF FIRE IN BUILDINGS.—Dated July 23, 1861.—C. Batty.

This consists in so arranging the ceilings that they may be separated from the floor immediately above, by a space through which a current of air passes with a great velocity when the ceiling becomes hot by a fire beneath, thus, it is said, keeping the inside or top surface of the ceiling cool, or comparatively so, and preventing the floor above becoming heated.

DRYING BRICKS, &c.—Dated July 24, 1861.—A. J. D. Seitz.

For the purposes of this invention a closed drying-room is constructed, provided with a ceiling having openings therein, closed by shutters, and having skylights. This room is fitted with benches constructed of flags, quails, slates, or other porous materials, to receive the bricks or other articles to be dried, spaces being left between for the passage of barrows and workmen. In this drying-room is arranged a system of pipes, heated, by preference, by means of the waste steam from the steam engine, as being more economical, but a separate boiler may be employed if necessary.

MACHINE FOR CUTTING WOOD.—Dated July 23, 1861.—R. Thompson.

This consists in an arrangement of machinery whereby revolving cutting tools for chasing, grooving, moulding, &c., can be moved (while in the operation of cutting or otherwise) in any direction required by the workman, giving him complete command over

the tool to follow any line of cut, traced out, without in any way interfering with the revolving action of the cutter or other driving power. The principle consists in mounting the cutting tools in a carrier or traverse block, such block being free to travel along a beam, revolving motion being communicated to the cutter by a gut or band, actuated by a double-grooved pulley revolving freely upon a shaft.

MACHINERY FOR DRESSING SLATES.—Dated July 27, 1861.—C. E. Amos and J. Francis.

This invention relates to a novel arrangement of machinery whereby roofing slates may be cut, trimmed, or dressed to the different sizes used for building purposes. The machine consists of a rectangular frame, which may, if necessary, be mounted on wheels for the convenience of transporting or removing the machine from one locality to another. This frame is provided with a fixed knife, and also suitable bearings for a lever or "sword arm," which carries a movable knife. The "sword arm" or lever is suspended by a spring or springs, so that, when in a normal position, the movable cutting edge is raised above the lower knife edge, and the two edges resemble a pair of open "shears," and act in the same manner. A treadle frame is attached by means of a link to a lever which is upon the same spindle as the "sword arm," and the knife edges are brought together by the pressure of the foot of the workman, or, if desired, the machine may be worked by mechanical power, by applying power to the treadle lever; or the treadle lever may be dispensed with and the power may be applied direct to the "sword arm." The spindle of the "sword arm" is made adjustable to compensate for wear in the cutting edge and other working parts, and a gauge plate with suitable marks or points, corresponding to the different recognised sizes of roofing slates, is placed on the framework so that the rough slates may be laid in their proper places and adjusted with facility.

IN THE CONSTRUCTION OF BUILDINGS, AND IN MATERIALS AND MACHINERY TO BE EMPLOYED THEREIN.—Dated July 30, 1861.—M. Allen.

In carrying out this invention the inventor proposes to construct staircases in such a manner as to economise the space they usually occupy, and to render the same fire-proof by insulating them from every internal portion of the building. This he proposes to accomplish by arranging the stairs in a semi-circular or other recess in the outer wall of a building, extending from its foundation to the roof, and having no openings whatever on its inner side; this recess is made with openings as doorways on its outer face, through which the stairs may be approached on one floor, and terminate on the floor by doorways or openings leading to balconies running along that part of the building in which the stairs are placed, and by means of which access is obtained to the several floors or flats. As regards the improved materials, they consist of burnt clay, cinders, slag, coke, culm, or clinkers, and other calcined substances of similar character thereto, and possessing an irregular woven porous surface, mixed with Portland or other cement or lime. As regards the machinery, it consists of a machine made in the following way for the better mixing and incorporating together the aforesaid materials or any other materials used in building:—The inventor takes a box or vessel, the under side of which is movable, in which he arranges horizontally a revolving shaft, having a number of knives, pegs, or rakes, inserted or fixed therein; the materials to be mixed are thrown into the said box or vessel, and the shaft driven round until the whole of the materials have become thoroughly mixed together; the lower part of the box or vessel is then opened, and its contents allowed to flow out ready for use.

Correspondence.

SAFETY HAVENS FOR MINERS.

SIR,—Colliery proprietors are, doubtless, now impressed with the necessity of universally having two shafts to each pit, and also a communication or staple between the upper and lower seams of coal, the want of which caused the fatality during the late tragedy. Yet there is another safety-valve which would protect the lives of miners, if the brattice should be destroyed by fire, explosion, or otherwise, and as it has not been noticed by others, permit me to describe my idea. Division of a shaft generally occasions sufficient ventilation in the whole of a pit to enable miners to work in any part. When a brattice is disarranged, the upward current of gas and downward passage of air cease, and probably at the same time the mode for the men leaving the pit is unguarded. Inexpressible relief would be conferred on the imprisoned miners by the facility at such a time to escape to a selected and particular part in any of the seams, where they could congregate in safety and wait for relief. This object could be secured by embedding under the brick or wooden casing of the shaft a diaphragmatic pipe or a double concentric pipe laid from the outer air to the spots chosen as "havens of safety" in each of the seams, which would be thus ventilated perfectly distinct from, and independent of, the mode adopted for the remainder of the pit. This is merely an extension of the brattice principle, and a plan often used for ventilating particular rooms in buildings. It may be desirable to have the power at each of the selected spots to close the ventilating pipes in any of the other seams where the use of it may not be required.

GEORGE WALCOTT, C.E.

24, Abchurch-lane, London, E.C., February 15th, 1862.

TENDERS.

CORN EXCHANGE, LEIGHTON BUZZARD.

For erecting a corn exchange and public-rooms, at Leighton Buzzard. Messrs. Bellamy and Hardy, architects, Lincoln. Quantities supplied by Mr. James Barnett, London.

J. Perry, Junr., Hackney	£7,165 0	J. W. Sawyer, London	£3,950 0
Hardman and Co., London	6,750 0	S. Holdstock, Leighton	5,756 5
J. Nutt, London	6,416 0	William Mead, Leighton	5,685 0
Geo. Cooper, Aylesbury	6,320 0	Nash and Co., Leighton	5,600 0
Geo. John Carter, London	6,065 0	W. R. Rowe, London	5,577 0
Geo. Dawson, Leighton	6,058 10	J. Doddington, Wellington	5,120 0
E. Conder, London	6,057 0	Osborne Brothers, Leicester	4,988 0

* Accepted.

CHAPEL, SHOREHAM.

For erecting a chapel at Shoreham, Sussex. Mr. Horatio N. Gouly, architect, Brighton. Lockyer £392 | J. and W. Goddard (accepted) | £300 || R. Patching and Son | 367 | | |

CHURCH, EAST HAM.

For erecting a new church at East Ham. Mr. A. W. Blomfield, M.A., architect. Quantities supplied by Mr. J. A. Bunker.

Bird	£3,439	Child, Son, and Martin	£3,096
J. and W. Sanders	3,588	G. Carter	2,990
Mansfield and Son	3,272	Browne and Robinson	2,959
Myers and Sons	3,259	Turner and Sons	2,939

GAS METER TESTING-HOUSE, SOUTHWARK.

The tender of Mr. Nixon has been accepted by the Metropolitan Board of Works for the erection of a temporary gas-meter testing-house in Castle-street, Southwark, at £1,598. Estimate of Mr. Vulliamy, superintending architect, £1,450.

NEW SCULPTURES FOR THE BRITISH MUSEUM.—A group of Europa and the Bull, of the size of life, found in the ancient Roman amphitheatre at Gortina, in Crete, has lately been exhumed, and has been brought to England by her Majesty's ship *Scourge*; within the last few days it has been deposited within the British Museum, near the Carian and Cyrenian sculptures.

* Neve, Seymour, and Newton give the year in which St. Giles' Church was built as 1090, while Entick and Thornton say 1099.

† It is somewhat curious that Stow should have given 1099 as the date of St. Giles' Church, while he here names the reign of William the Conqueror, who died in the year 1067.

COMPETITIONS OPEN.

BRIDGES.

DUBLIN.—The committee appointed to carry out the new Carlisle bridge (Dublin) scheme, require plans and specifications for the erection of the structure on the present site, the full breadth of Sackville-street. £200 will be paid for the best and most approved plan, £100 for the second, and £50 for the third. The plans, &c., to be the property of the committee, to whom applications are to be made at the Imperial Hotel, Sackville-street, Dublin.

HARBOR WORKS.

LYME REGIS.—The Borough Council require a plan, specification, and estimate for carrying out certain works at the Cobb or harbor there; to be sent in to G. Hingerton, town clerk, by March 1st, when the successful competitor will receive 15 guineas. Full particulars can be had at the offices of the Cobb clerk or town clerk, Lyme Regis.

LAYING OUT.

TRANMERE.—The directors of the Tranmere Freehold Land Society desire plans, before the 25th March, for laying out and allotting the estate belonging to the Society, in Higher Tranmere; consisting of about 40 statute acres. Premiums will be given for the best and second-best plans. Each plan to be accompanied with an estimate of the cost of the formation and construction of the roads and sewers, and also of the laying out of the land. Particulars from Mr. John Quinn, Chairman of the Society, 22, Lord-street, Liverpool; or from Mr. H. P. Priest, Secretary, Market-cross-chambers, 19, Market-street, Birkenhead.

CONTRACTS OPEN.

MANSTON, &c.

SOUTHAMPTON.—For the erection of a mansion, &c. Particulars from Guillaume, Parmenter, and Guillaume, architects, &c., Southampton.

PAVILION.

WORCESTER.—For the erection of a pavilion, to be constructed of wood and glass, for the Worcester Pleasure Grounds Company, Limited. Plans, &c., at the offices of Mr. A. P. Watkins, 50, Foregate-street, Worcester, and bills of quantities obtained of the architect, Mr. Cranston, No. 1, Temple-row-west, Birmingham. Tenders to be sent to the secretary, endorsed "Tender for Pavilion," on or before the 8th March.

PIER.

BLACKPOOL.—For the erection of an iron landing and promenade pier, for the Blackpool Pier Company, (Limited). Plans, &c., on Monday the 3rd March next, at the office of Messrs. Birrell, the engineers to the company, 43, Parliament-street, London, S.W., or at the Company's office, Blackpool; and bills of quantities will be furnished on payment of ten shillings. Sealed tenders by the 10th March next, addressed to the chairman of the Blackpool Pier Company, Blackpool.

PRISONS.

KENT.—For certain works to be done at the county prisons, Maidstone, to form store-room, &c. Plans, &c., with Martin Bulmer, county surveyor, Maidstone. Sealed tenders, endorsed "Tender for Works at the County Prisons, Maidstone," are to be delivered to Mr. Bulmer, by four p.m., on the 27th inst., and persons tendering are to be in attendance at the Courts of Justice, Maidstone, at half-past twelve on the 28th February.

CHURCHES.

BIDEFORD.—For rebuilding Bideford Church. Plans, &c., on application to the rector, till the 3rd March. Sealed tenders addressed to the secretary, on or before March 10th.

WAKEFIELD.—For the erection of a new parish church, at Ossett, near Wakefield. Plans, &c., with W. Henry Crossland, architect, Harrison-road, Halifax, to the 28th inst. Sealed tenders, endorsed "Tender for the New Parish Church, Ossett," to be delivered to Mr. Crossland, on or before 3rd March.

BIDDULPH.—For the erection of a new church on Biddulph Moor. Plans, &c., with the Rev. Francis Gordon, the Parsonage, Biddulph Moor, near Congleton. Tenders to be addressed, sealed, to Mr. Gordon, and none received after the last day of February.

IRELAND.—For the internal fitting up and repairs of the churches of Carnacastle, co. Antrim; Seagoe, co. Armagh; and for the enclosure of the church of Upper Falls, co. Antrim. Plans and specifications with the resident ministers of the parishes. Tenders to be forwarded, sealed, prepaid, and addressed thus:—"Proposal for ———, the Church of ———," "The Ecclesiastical Commissioners for Ireland, Dublin." by March 1.

CHAPELS.

BRISTOL.—For the erection of the Clifton Wesleyan Chapel. Drawings, &c., with Fosters and Wood, architects, 6, Park-street, Bristol, till the 28th inst., on or before which the tenders are to be sent to the architects, sealed and endorsed "Tenders for Clifton Wesleyan Chapel."

BRADFORD.—For the erection of the new Baptist Chapel, Manningham-lane, Bradford. Drawings, &c., at the school-room of Zion Chapel, Bradford, Yorkshire. Tenders for the whole or parts of the works will be received up to 10 o'clock on March 8th.

WOOLWICH.—For a chapel to be erected near Woolwich, Kent. Drawings, &c., on application to Giles and Brookhouse, architects, Victoria-chambers, Derby, or at the residence of the Rev. R. Sergeant, 11, Brewer-street, Woolwich. Tenders to be delivered to the Rev. R. Sergeant not later than 12 noon on the 27th inst., endorsed "Tenders for new Chapel."

CROYLAND.—For the erection of a new school-room and additions to the Wesleyan Chapel, Croyland. Plans and specifications at Mr. Sanderson's, chemist, Croyland, where tenders to be addressed to and delivered on or before the 1st March.

LANCASHIRE.—For the erection of a dwelling-house, together with spacious business premises, proposed to be built in Lytham, Lancashire. Plans, &c., with Mr. S. Wartenberg, the Bazaar, Lytham. Tenders not later than 26th February.

PARSONAGE.

PERTH (N.B.).—For the erection of a new house and office, at Dunning, Perth, N.B. Drawings, &c., with the architects, William G. Habersham and Pite, 38, Bloomsbury-square, London; and on application to the clerk of works (Mr. Jones), at Duncrub-park, Dunning.

FARM BUILDINGS.

IRELAND.—For the erection of a set of farm offices on Mrs. Hackett's farm, at Cowanstown, near Maynooth, the estate of the Duke of Leinster. Plans, &c., at 13, Lower Dominick-street, Dublin, up to the 28th inst. Tenders by the above date to Francis Trench, Esq., Newlands, Tallaght.

RAILWAY WORKS.

IRELAND.—For the construction of the works upon the Midland Counties and Shannon Junction Railway, between Clara and Banagher, and commencing at a point a mile and a half from the Junction of the Midland Great Western and Great Southern and Western Railway Companies, on to Banagher, a distance of about 17½ miles. Plans, specifications, quantities, &c., are to be seen with the engineers of the Company, John Hill, Esq., Tullamore, and Henry Brett, Esq., 8, Harrington-street, Dublin. Tenders to be sent in not later than the 8th March, at 12 o'clock noon, endorsed "Tender for Works," and addressed to J. Fowler Nicoll, secretary, offices of the Company, 53, Lower Dominick-street, Dublin.

STAFFORDSHIRE.—For the construction and extension of the line of the Staffordshire Potteries Street Railway Company from Hanley to Longton, in two sections:—Section and Contract No. 1, from Hanley to Stoke. Section and Contract No. 2, from Stoke to Longton. Drawings, &c., at the engineer's offices. Form of tenders, to be obtained from the secretary, to be delivered at the Company's offices, 6, Trinity-street, Hanley, on or before the 26th of February.

WATERWORKS.

WELCHPOOL.—For laying and jointing about 6,500 yards of cast-iron pipes, and for providing and fixing sluice cocks, hydrants, and other works, for the Welchpool Waterworks. Specifications, &c., may be obtained of Messrs. Robert Dymond and Sons, surveyors, Exeter, at 10s. 6d. each. Tenders by March 10.

MILITARY WORKS.

SCOTLAND.—For contracting from 1st April, 1862, to 31st March, 1865, inclusive, for the performance of such artificers' work as may be required at the under-mentioned stations,

viz.:—Edinburgh Castle; Piershill Barracks; Leith Fort, Martello Tower, and Blackness Castle; Greenlaw Military Prison and Barracks; Perth Barracks; Dundee Barracks and Broughty Castle; Dunbar Barracks; Berwick and Holy Island; Glasgow Barracks; Dumfries Castle; Paisley Barracks; Hamilton Barracks; Ayr Barracks; Fort Matilda; Stirling Castle; Aberdeen Barracks; Beach and Torry Point Batteries; Forts George, Augustus, and William. In all cases, the seven tenders are to be in one tender for each station, and the contracts to be determinable at any period after the first year, on either party giving to the other three months' notice in writing. Any person may tender for one or more of the above stations. Parties applying for forms of tender must give sufficient guarantee to the entire satisfaction of the commanding royal engineer of their being fully competent to undertake and execute any new works or repairs that may from time to time be ordered on the contract schedules. Every information on application to the Royal Engineer or Barrack offices, at the several stations herein named, together with printed schedules of the prices, with the terms of contract and letter of tender for the several descriptions of artificers' work, to the 27th February, upon making a deposit of five shillings for the same. The letter of tender to be sealed, and transmitted under cover to the Director of Contracts, War Department, Pall-mall, London, S.W., so that it may be received on or before the 10th March, 1862, and to be marked on the left-hand corner of the envelope, "Tender for Works at ———."

RESERVOIR.

RYDE.—For constructing a reservoir at Knighton, for the Ryde Commissioners. Plans, &c., with William Henry Pullen, clerk, Town-hall, Ryde; or at Messrs. Easton, Amos, and Sons, Grove, Southwark. Sealed tenders to be sent to me on or before Monday, the 24th day of February instant. No pledge is given to accept the lowest or any tender.

DWELLING HOUSES.

HERTS.—For the erection of a dwelling-house at Lottford, Standon, near Ware, Herts. Plans, &c., with Mr. Chapman, Lottford, and at the office of the architect, Charles Chapman, St. Mildred's-court, Poultry, E.C. The quantities will be supplied, and no tenders will be accepted unless based on the same. Tenders will be delivered on the 27th instant, at the office of the architect.

ROADMAKING, &c.

IRELAND.—For the following works, in the barony of Gorey, in the county of Wexford:—1.—For making a new line of road from the corner of the Post-office in Gorey, to Edward Foley's cottage in Ballyraheen, containing about 415 perches; not to exceed £500. 2.—For making a new line of road from Gorey to Tinahely, containing about 300 perches, in the townland of Ballingarry. Plans, forms of tender, &c., obtained, at the office of Henry E. Wynne, secretary to the Grand Jury, County Court House, Wexford.

MANCHESTER.—For sewerage, levelling, paving, flagging, and channelling so much of Sloan-street, and the footpaths at the sides thereof, as lies between Moss-lane and Raby-street, in Moss Side. Plans, &c., at the office of Mr. John Wolstencroft, surveyor to the Board, Moss-lane east, Moss Side.

SEWERAGE.

OXFORD.—For constructing an open sewer along a portion of the Trill Mill Stream in the city of Oxford. The drawings, &c., at the Commissioners' office, Town Hall, Oxford; or particulars obtained from Mr. John Galpin, surveyor. Tenders, on printed forms, which may be obtained either of the clerk or the surveyor to the Commissioners, must be delivered, sealed, to Frederick J. Morrell, clerk to the Commissioners, No. 4, St. Giles's-street, Oxford, on or before twelve noon, on 10th March, endorsed "Tender for Open Sewer."

DRAINAGE.

HANTS.—For laying pipes, erecting filter tanks, and executing other works for the drainage of the town of Alton. Copies of the quantities, with forms of tender (price 2s. 6d. each) may be obtained, and the specifications and drawings inspected, on application to William Trimmer, clerk to the Board, Alton; or to Mr. T. W. Penfold, 2, Charlotte-row, Mansion-house, London. Tenders to be sent in on or before 4th March.

ROTHERHAM.—For the execution of such drains as the Vestry may direct to be performed in the parish of Rotherhithe. Printed forms of tender and schedule of works, with conditions, may be obtained at the clerk's offices, 61, Paradise-street, Rotherhithe; or of Mr. George Legg, the surveyor, 61, King William-street, London-bridge. Tenders, accompanied with the name of one responsible person as surety, to be sent to the clerk's offices on or before 12 o'clock on the 4th of March.

SUPPLY, &c.

SWANSEA.—For the following contracts for the Swansea Local Board of Health. Contract No. 2.—For supplying cast-iron water-pipes, and other castings. Contract No. 3.—For supplying sluice valves, hydrants, and other steel fittings. Contract No. 4.—For laying and jointing cast-iron water-pipes, fixing sluice valves and hydrants, and for other works. Duplicate specifications, &c., on payment of £1 for each contract, on application at the office of the town-clerk, Guildhall, Swansea; or at the office of Robert Rawlinson, Esq., Civil Engineer, 34, Parliament-street, Westminster. Sealed tenders, endorsed, "Tender for Contract No. 2, 3, or 4," must be forwarded to the office of C. B. Mansfield, town clerk, Guildhall, Swansea, on or before the 25th Feb.

ROTHERHAM.—For supplying, for the use of the Vestry of the parish of Rotherhithe, Guernsey granite spalls, York paving, half-sovereigns for carriage paving, curb, &c. for one year, to be delivered alongside wharf at Rotherhithe. Forms of tender and schedule of articles to be supplied may be obtained at the clerk's office, 61, Paradise-street, Rotherhithe. Tenders to be sent to the clerk's office by 12 noon of the 4th March.

BRIDGE.

BOLTON.—For the erection of a timber bridge across the river Irwell, at Agcroft-bridge. Plans and particulars at Mr. A. Pilling's, Contractor's office, Davenport-street, Bolton.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

F. R. D. (Birmingham).—Next week.

A. SUSSEX.—Will be completed very shortly; notice will be given.

W. C. R.—Lists will be given as soon as space allows. 2. We cannot say; they are specially prepared for us at some cost.

J. L.—Photographs of plans received; shall be looked into; send particulars.

AN ARCHITECT'S PUPIL (Bristol).—We cannot give prominence to statement unless writer's name and address is furnished for our private information.

T.—Should be satisfied this week.

JACK PLANE.—Next week.

C. T.—Send sketches.

J. M. F.—Yes; view shall be engraved.

W. 1.—The total amount subscribed to the Albert Memorial Fund is nearly £30,000. 2. It is impossible to say.

W. H.—Thanks.

S.—(Glasgow).—Ditto.

P. N. W.—Shall hear from us.

M. W.—Letter has been mislaid; reply shall be sent.

F. V.—Beyond our province.

X. R. X. 1.—Received. 2. Before long.

R. B.—Much obliged.

NOTICE.

The Seventh Volume of the BUILDING NEWS is now ready, bound in cloth, price 21s. Subscribers can have their copies bound, either with or without the advertisement pages, for 4s. 6d., on sending them to the office. Cases ready for binding the volume may be had price 2s. each.

* * * All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Dowell-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Dowell-court. Advertisements are received up to six o'clock on Thursdays.

THE ALBERT MEMORIAL.

Y LORD,—I have had the honour of receiving, and of submitting to the Queen, your lordship's letter of the 18th inst., communicating the proceedings which have taken place with the view to the erection of a national memorial monument to the much lamented Prince Consort.

The Queen feels grateful from the bottom of her heart for the universal sympathy that has been expressed for her in her deep affliction. But it is still more soothing to her feelings to know that the noble character, the truly princely nature of him whose loss has bowed her to the earth with a sense of desolation and misery that every day, alas! serves only to increase, is appreciated by the country; that the benefits he has been instrumental in conferring on the nation, the good he has brought since he first came amongst us, to effect which he may be truly said alone to have lived—are understood and acknowledged.

The Queen is also much touched by the feeling which has led the promoters of the movement for erecting a national monument to the Prince to leave the nature of that monument to her decision. It is a subject on which there must be necessarily some difference of opinion. Many, influenced doubtless by the belief that there was nothing which the Prince himself had so deeply and constantly at heart as the promotion of whatever might tend to the advantage of the community at large, or any portion of it, have thought that the most appropriate monument to his memory would be to commemorate his name with some great work that should have that end in view; and the Queen cannot but be gratified by this proof of a just appreciation of his character.

But it would probably be difficult to procure anything like agreement as to the nature of the institution which should thus bear his honoured name, and it would be inexpressibly painful to the Queen were any controversy to arise on such a subject.

It would be also more in accordance with her own feelings, and she believes with those of the country in general, that the monument should be more directly personal to its object—should be, in fact, more than what is commonly indicated by the word. Even so, it is probable that opinions may differ as to the character that would be most appropriate for such a monument.

But the Queen is confident that the same good feeling which has led to the reference of the subject for her decision will lead to a cordial acquiescence in it, to the cheerful abandonment of individual views, and to a unanimous working together to effect the object all have at heart.

After giving the subject her best consideration, her Majesty has come to the conclusion that nothing would be more appropriate, provided it is on a scale of sufficient grandeur, than an obelisk to be erected in Hyde-park, on the site of the Great Exhibition of 1851, or on some spot immediately contiguous to it; nor would any proposal that could be made be more gratifying to the Queen personally, for she can never forget that the Prince himself had highly approved of the idea of a memorial of this character being raised on the same spot in remembrance of the Great Exhibition.

There would also be this advantage in a monument of this nature, that several of the highest artists of the day might take part in its execution, for there would be room enough at its base for various groups of statuary, each of which might be entrusted to a different artist.

In the selection of the artists to be employed in the choice of a design, and in the considerations of the details of execution, the Queen would wish to obtain the best advice, and she would therefore desire to call to her assistance a small committee, consisting of persons in whom she could feel satisfied that the country would repose entire confidence.

I have written, by her Majesty's commands, to those whose assistance she thus desires to obtain, and will lose no time, as soon as I have received their answers, in communicating their names to your lordship.

I have the honour to be, &c.,

C. GREY.

MY LORD,—The Queen wishes me to add a few words to the answer to your letter, which you will receive with this, expressive in a more especial manner of her Majesty's personal wishes.

She is aware that she could not with any propriety contribute, as a wife, to a monument to her husband; but she is also the Sovereign of

this great empire, and, as such, she cannot but think she may be allowed to join with the nation in the expression of a nation's gratitude to one to whom it owes so much.

Who has a dearer interest than the Queen in the well-being and the happiness of the people? And if it has pleased God to make her reign so far happy and prosperous, to whom, under Divine Providence, is this so much owing, as to her beloved husband—in all matters of doubt or difficulty her wise counsel, her unflinching guide and support?

No one can know, as the Queen knows, how his every thought was devoted to the country—how his only aim was to improve the condition of the people, and to promote their best interests. Indeed, his untiring exertions in furtherance of these objects tended, in all probability, to shorten his precious life.

Surely, then, it will not be out of place that, following the movement of her people, the Queen should be allowed to consider how she may best take part with them in doing honour to her beloved Prince, as that the proposed monument may be recorded to future ages as reared by the Queen and people of a grateful country to the memory of its benefactor.

I have the honour to be, &c.,

C. GREY.

Osborne, Feb. 19, 1862.

The Right Hon. the Lord Mayor, &c.

Thus does the Queen of England speak to her people.

It was for a considerable time a matter for regret with a large number of men that the Committee entrusted with the fund for rearing a suitable monument to the late Prince Consort neglected, at the first mention of the proposal, to state distinctly the form which the memorial was to take. Scheme after scheme has, in consequence of this neglect, been paraded before the public, backed by zealous advocates, and gathering together many partisans—all of whom were likely to take umbrage if their energies in favour of charitable gratitude were thrown away. The uncertainty long continued, in which the subscribers were kept, fostered all kinds of wild suggestions, and made them painfully prominent; at length, as might have been anticipated, suggestions were launched for dividing the collected sum, in order to satisfy the many claimants for means to commemorate the illustrious patron of the several bodies. It is true that the "monumental character" of the memorial was, at the first meeting, spoken of, but it was the uttered opinion of an individual only, and it was not given by authority of the immediate and responsible promoters. Nothing, perhaps, shows more fully the esteem in which the Prince Consort was held, and the deep sympathy which all classes of English men feel for our widowed Queen, than the fact that so large a sum has been raised without other than a general object of preserving to future ages some record of the blameless Prince. But if the silence of the Committee occasioned regret, that regret was deepened when it became known that the members composing it were about to shift their responsibility on to the shoulders of the Queen, and to interpose her Majesty between the Committee and any dissatisfaction which the decision might occasion. Every one has read of the amiable and loving regard with which the Queen cherishes every institution which her husband toiled for. The pardonable bias with which she might lean to aught which he loved and patronised was remembered with anxiety. The guardians of these countless institutions had not been slow to make known their wants and wishes. If affection had warped the judgment of the Queen, and prompted her to scatter this Memorial Fund broadcast over many charitable institutions, we could scarcely have been surprised. The temptation was great, perhaps, for the wife to relieve, in memory of her husband, the sorrows which he ministered to; but the Queen of England has soared above the embarrassing and wrong position in which she was thoughtlessly placed by the Committee, and in the most touching letters which were ever addressed by a sovereign to its subjects, makes her decision known, and directs our onward course. Instinctively she appears to have seen the difficulty of agreement in any so-called utilitarian scheme, whilst acknowledging the just appreciation of his character which have prompted suggestions in that direction. After giving the subject her best consideration, her Majesty has declared in favour of an obelisk, with groups of statuary at the base, each of which might be entrusted to a different artist. To choose a design, and in the consideration of the details of execution, the Queen will call to her assistance a small committee. The form of the monument being now definitely settled, we hope we shall have no more discussion on that point, but that the artists will be allowed to make the monument, by its display of art as well as by its grandeur, worthy of the Prince's noble character, and also of "the Queen and people of a grateful country," who thereby honour its benefactor.

An obelisk is, perhaps, the oldest as well as the most enduring form of monument which could have been chosen. We have not, it is true, been particularly happy in our culture of the idea in England. The obelisks in the Fleet valley and in the Blackfriars-road allow ample

scope for improvement; but it must be admitted that our other public monuments are equally unsatisfactory. We believe the miserable results have been more owing to official interference and to bad subjects than to artistic incapacity. Our English sculptors are equal to any which other nations now can show, even if we reckon Baron Marochetti a foreigner. Foley's statue of Lord Hardinge alone is enough to point to for evidence of our skill in equestrian statues; Gibson's bas-reliefs will hold their own against the chiselled marble of any modern nation; and numerous other Englishmen may, by merit only, take a foremost place when occasion demands Art's tribute to a great and glorious Prince.

As every one knows, ancient Egypt has supplied nearly all the obelisks which have been reared in our modern cities, and more than one-half of those transported from the valley of the Nile are to be seen in Rome; but they have all, more or less, this defect, that they speak of the death of the nation which so far disregarded her antiquities as to banish or barter them away. Their mystic characters preach no lesson to the people. The modern inscriptions occasionally found cut upon them tell us that they have been dragged to their present sites to gratify a conqueror's vanity. That in the space in front of St. Peter's is put ignobly to serve as a gnomon to a monster dial. None of them quicken the "patriotic tide," as does Rauch's group in honour of the Great Frederick, or the Napoleon Column in the Place Vendôme. They are weak and spiritless, not because they are obelisks, but because they were designed for one purpose, and devoted ignorantly to another.

In the Albert memorial we have an opportunity, then, of making the obelisk a monument expressive of English feeling, and of the state which art has arrived at in this nineteenth century. For the first time since the days of the Pharaohs, with one or two insignificant exceptions, a stupendous obelisk will be designed and carved instead of being simply erected, and it will record the sorrow which was endured by a Queen and her people for a great loss in place of the gratified vanity which conquest had begotten.

It is well for us to consider beforehand how we are prepared to execute this work. As regards material, we may dispense with a special stone committee, and thus avoid all necessity for patented preservative silicates. Upon granite and bronze we can hand down our Prince's memory. There are quarries near Liskeard and Penzance where monoliths may be procured at least 100 feet in length and 10 or 12 feet square. Aberdeen can supply us with a variety of granite if we desire coloured ornamental accessories. Although an obelisk is decided upon, it will not, we presume, be a simple monolith on a square pedestal, with sculptured bas-reliefs. Groups of sculpture will surround the base, and with these we must try to make conspicuous the various attributes of him in whose honour the monument is built. We know with what riches the pyramid or Mausolus was encircled. We would have the Albert memorial equally famous and equally deserving of such fame. But the great difficulties will be more in the preparation of the general design than of the sculptured portions of it. Our sculptors are, we believe, fully equal to the latter undertaking, but we doubt their ability to execute the former satisfactorily. The architecture of sculptors' monuments is almost invariably bad, for the simple reason that sculptors have not now-a-days the time, even if they have the inclination, to study the sister art. They regard architecture as a musician looks upon the libretto of his opera—as a simple material for the display of his abilities, to which it must, of course, be subservient.

We trust that the Committee which her Majesty will call to aid her in selecting a design, will not fall into an error of this description; that they will recollect that in all the greatest works of antiquity, architects were associated with sculptors. Phidias could deck the Temple of Minerva with priceless sculpture, but it was out of his power to design that majestic framework for it, which even now, despoiled by time and man, stands in melancholy grandeur, the glorious crown upon the Hill of Mars. There have been sculptors, we admit, who were likewise great architects and distinguished painters, but Michel Angelos are not to be had by asking for them, and assuredly we shall find no men of equal calibre in modern London. We shall be content if the work be well done by several hands, and if different minds can be brought to labour at one design. Moreover, a wish is expressed in her Majesty's letter that more than one sculptor shall be employed upon the memorial. We foresee considerable confusion and much unpleasantness if one of these gentlemen should be exalted above his fellows by being entrusted with the conception of the main design for the monument. The difficulty of selecting a sculptor to do that portion of the work would be great.

The preparation of the design lies undoubtedly within an architect's province, and he certainly ought to be best able, on account of his training, to do it. We would not forbid a sculptor trying his hand at it, but at the same time we would suggest that a preliminary competition, limited or unlimited, as the Committee may decide, should take place amongst architects for the general arrangement of the memorial;

it should be distinctly understood that the position of the sculptured groups, &c., was alone to be shown, that it was not a competition for the sculptured work at all, but simply and solely for the shell of the monument, without reference to the detail of the sculpture which was afterwards to adorn it. The bestowal of commissions upon the different sculptors would follow, as a natural consequence, the selection of the architectural design, and all would work harmoniously together to show the world that the right men are not wanting in England when a great event demands their services, and that the Prince who in life watched for every opportunity to benefit the people, and to infuse into them the sweet influence of art, would in death not only awaken in the people's breasts appreciation of his noble character, but stimulate our artists to rear in England one good monument to the one Prince who has been worthy of it; a monument which would deserve to be inscribed with the closing words of the Queen's letter, and tell to future ages that it was "reared by the Queen and people of a grateful country to the memory of its benefactor."

Her Majesty has named the Earls of Derby and Clarendon, Sir Charles Eastlake, and the Right Hon. William Cubitt, to form the Committee referred to.

"THOUGHTS ON DESIGNING A PICTURE GALLERY."

A DIFFICULT thing to design is, consequently, generally a good thing to design. The very difficulty begets extra thoughts and extra work, and that extra thought and work brings out additional skill. Moreover, if the circumstances are such that the usual decorations should be dispensed with, so much the better, at least for once, for the way is then left open for the use of decorations of an unusual kind; and if the difficulty in designing comes from the difficulties of planning or arrangement—if the best mode of arrangement is still a matter of differing opinion among authorities on the subject, still more interesting is the task; and more interesting still does it become if the object of the building is one in which our education and favourite studies cause us to take a deep interest.

These thoughts have arisen while thinking on the subject of picture galleries—of the difficulties, both in design and arrangement, that they present—and yet on the many great and unusual facilities they afford for original treatment, and unusual materials, modes, and degrees of decoration.

We will first enter briefly into the best mode of lighting, which so intimately concerns the external architectural treatment, and the best mode of dividing and arranging the pictures, which so much affects the mode of lighting. The great authorities differ much, but the majority seem to agree upon one important principle, namely, that the window or light by which a picture is seen, and the picture itself, ought not to come within the range of vision at the same time; and yet, although the fullest development of this principle was practically carried out many years ago in a building erected expressly for the temporary exhibition of a collection of the pictures of Sir Benjamin West, and has since been carried out in one or two private galleries, yet out of all the large public galleries of Europe, there is but one room that is erected for the purpose of giving the pictures therein exhibited the most favourable light possible in accordance with this principle.

The galleries of Berlin and Vienna are lighted with side lights. The Louvre is partly lighted in one manner and partly in the other. Our National Gallery and Royal Academy rooms, and those at South Kensington, are lighted from above. The older Pinacotheca, at Munich, is a well lighted and well arranged picture gallery, and, for ordinary purposes, seems a very good model to keep in mind. This combines each mode—often a wise course when authorities differ. In the same building we find the large saloons lighted from above, and the small cabinets lighted from the side. At the new gallery at Dresden the same system has been carried out; the larger pictures are lighted from above, and the smaller cabinet pictures from the side.

But, as mentioned above, there is one particular room of one gallery in Europe where the principle so successful in the advantageous display of Sir Benjamin West's pictures, and which, in a different form, was used some time ago for a temporary exhibition at Rome, has been permanently and successfully carried out. This is in the artistic city of Munich. The ex-King Ludwig knows well what is good both in and for pictures, and is sure to have whatever will show them to the greatest advantage.

The gallery where it has been adopted is the new Pinacotheca, a building erected and expressly set apart for modern pictures, whereas the older Pinacotheca contains the older masters only. The room referred to is that occupied by the pictures of the landscape painter Rathman, painted in Greece by the command of King Ludwig; and the mode of lighting employed seems much the same as that described by Messrs. Papworth in their valuable little work on the subject.*

The principle of not seeing the pictures and the source from which the light is obtained at the same time is effected by means of a screen or wall supported by columns. These, then, are the three variations in the way in which picture galleries are lighted; whether this last mode is so great an improvement as to make up for the inconvenience of the columns, may be doubtful, they are not, however, necessary; a suspended roof, as suggested

* "Museums, Libraries, and Picture Galleries, &c." John W. Papworth and Wyal Papworth.

by Messrs. Papworth, or a suspended screen, as used at the Exhibition at Rome, would answer the purpose equally well.

The division and arrangement of the pictures have also much to do with the arrangement of the gallery, and consequently with the exterior decoration. In the older Pinacotheca at Munich, the paintings are grouped according to schools, and in this gallery is a most useful arrangement which might well be adopted in other galleries. A corridor runs the whole length of the building, 420 feet, so that whatever particular school you may wish to study you can go to at once, without going all through the rooms.

Another admirable plan is adopted in this gallery, that of setting apart a room close to the entrance devoted to the exhibition of new acquisitions, so that the crowding to see the last new arrival does not annoy those who are enjoying the older pictures.

This building contains grand staircase, entrance saloon, room for new acquisitions, curator's room, and copying room. The ground floor is set apart for engravings, terra cotta vases and mosaics, and porcelain enamels; these are mostly very beautiful copies by Munich artists of the pictures in the gallery.

The picture galleries upstairs are appropriated to the different schools of the old masters, in the following manner:—Italian, three large rooms, one of them 93 feet long, three cabinets opening out of them, lighted, by side windows; ancient German school, one large room and three cabinets; old Flemish school, one large room and three cabinets; more recent Flemish school, three large rooms, and showing how well the mode most suited to a particular size and school is applied; ten cabinets are devoted to the small and minutely finished pictures of this school. The French and Spanish share together one large room and three small cabinets.

Such are some of the leading features in the arrangements of some principal galleries in Europe, that stand for our models and as tests of the success of any particular principle that their promoters may have thought best to attain the end they had in view. The different architectural treatment depends much on which of these modes, both of lighting and arrangement of pictures is selected. If the mode of lighting selected be that used at Berlin and Vienna—that of lateral lighting—the windows become the principal objects in the composition, as is usually the case in our modern buildings, to whatever purpose they may be devoted; and a picture gallery then does not necessarily differ in external appearance from any other ordinary public building. If the mode selected be that of our National Gallery, that is, of lighting from above, the building has naturally to be treated in a way different from all ordinary buildings in northern countries, but gains this advantage if properly treated, that it can scarcely fail of telling everybody its special purpose.

But if the mode to be seen at Munich and Dresden of lighting, and of dividing the pictures into large and small, and placing them in rooms lighted respectively from above and from the side, be adopted, then the modes of treatment which the architect has at his disposal depends, at least, upon three circumstances:—

1. The number of the small pictures.
2. The point of the compass which is thought best or the lateral lights or windows to face.
3. The nature of the site, and the choice of the architect as to whether he will have in his principal front the usual ornamentation of windows, or the peculiar effect in our country associated with picture galleries of some kind of wall decoration.

For, in the first case, suppose that the smaller pictures are so numerous that cabinets lighted by lateral lights are necessary on both sides of the building, then the external treatment becomes the same as if the lateral system of light was alone adopted. But if the number of small pictures is only such as to need the small laterally lighted cabinets on one side, then the architect has two sides that must be treated differently, but which side he would select for decoration by the fenestration, or which for some kind of wall decoration, would depend on circumstances. In the older Pinacotheca this is determined by a northern light being chosen for the windows of the cabinets. This has been chosen for the principal front, which is, therefore, an ordinary looking building, which might be, from its appearance, almost anything else as well as a picture gallery.

But the third, that of the circumstance of site, will necessarily much affect the decoration of these double lighted galleries. If in a position like that of our National Gallery and many buildings in London and other large cities, one side of the building is so closed in by houses that all hope of a good lateral light is impossible; the principal and only façade looking into an open space must, in such a case, be the one lighted by windows, and its decoration, as usual, influenced by them, so that really we get out of the three modes of lighting—1. That of lighting from above alone. 2. That of lighting from the side alone. And 3. That of combining in the same building the two principles for different kinds of pictures, but two modes of treatment for the exterior of these buildings, one peculiar to these buildings alone, and the other not. The third, that of a building having two principal façades, telling on one side that behind its wall are large pictures which it is considered by its architect are best seen by a top light, and the other that the same building contains smaller pictures displayed by a lateral light, is an exceptional case not often met with. And existing examples prove this; for of two of the buildings which combine these two modes of lighting, the two Pinacothecas, at Munich; in one—the older Pinacotheca—the cabinet or window side of the building is the principal façade; and in the other—the new Pinacotheca—the large room or blank wall side has been selected as the grand front, and is appropriately adorned by a series of frescoes by Kaulbach. Certainly the new Pinacotheca is by far the

most striking building of the two, and bears on its walls much more clearly the purpose which the interior fulfils.

With regard to the external architectural treatment, after the mode of lighting and arrangement has been well considered and decided upon. Let us take the case of a picture gallery in which the system of lighting from above has been selected, as it gives by far more scope for treating the building in a way different in manner to most ordinary buildings; and, of course, whatever applies to this case applies equally to the case where the blank side of a twofold lighted gallery is chosen for the principal front. The first thought of an architect, is, what a splendid opportunity is here offered for an unusual display of both sculpture and painting! But, alas, our climate! and the fading nature of the most enduring frescoes! He remembers this, and asks, why in old times the Early Christians could afford to have their basilicas covered with pictures in mosaics; why St. Mark's at Venice is covered within and without with this beautiful, artistic, and everlasting ornament; while we have not a single specimen of such appropriate out-door ornament in all our costly buildings. If the ancient kind of mosaic is so costly, is there no invention that the manufacturers of pottery, enterprising and ingenious as they are, can think of, possessing the durability of the old mosaics, with, at least, some of their delicacy and beauty? Such a mode of out-door adornment for tympanums of arches and other wall spaces seems to be a desideratum.

The subjects chosen and the principle adopted in the new gallery at Dresden will show what scope there is in the associations naturally suggested by its contents for the artistic ornamentation of a picture gallery with first-rate sculpture; we find among the series of statues and bas-reliefs are Hercules, Perseus, Jason and Theseus, Prometheus and Pygmalion, Orpheus and Amphion, Homer and Hesiod, Apelles and Phidias, Lysippus and Alexander. On another front the Patriarchs and Prophets of the old covenant, and the Apostles and Evangelists of the new, with the artists who have so nobly depicted them, Michel Angelo and Raffaele; while on another part of the same front are the statues of Holbein, Giotto, Dante, Goethe, &c., &c. This is truly a good example, and the country that produces such a building will, besides the building, long reap the benefit of it, for a work containing such a mass of figure sculpture, is one of the best schools of art that a country can have, and is not, in this way, the purpose and design of the building written most forcibly on its walls?

The exterior of Sir Robert Peel's picture gallery at Drayton Manor, designed by Mr. Sidney Smirke, is a good example of the artistic treatment of the exterior of a picture gallery lighted from above, its exterior is embellished with colossal statues of Rubens, Vandyke, Sir Joshua Reynolds, and Sir Thomas Lawrence.

A picture gallery without windows at the sides can be made unusually beautiful, but this can only be the case when a totally different mode of treatment is adopted from what would be the case if it was lighted by windows; a great variety of modes is open to the designer,—coloured materials, painting, mosaics, sculptured bas-reliefs, niches expressly formed for and filled by statues, chosen appropriately for the occasion; any means of ornamenting, in fact, that the architect likes, except "blank windows." R. D.

THE BUILDERS' BALL.

AS briefly intimated in our last, the annual ball in aid of the funds of the Builders' Benevolent Institution, took place at Willis's Rooms on Thursday, the 20th inst., under the patronage of the Right Hon. the Lord Mayor, who was present, attended by Mr. Sheriff Cockerell and Mr. Sheriff Twentymann. Many influential contractors were present, and the Rooms were crowded for the greater part of the evening. We believe that an addition of something like £120 to the funds of the Institution is one of the results of these annual gatherings.

MANCHESTER ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of this Association was held on the evening of Wednesday, February 19th, at the Rooms, George-street, the Vice-President in the chair.

After going through the minutes of the previous meeting the Chairman called upon Mr. Alfred Darbyshire to read a paper on the subject of Irish Antiquities, being the result of a recent tour through that country.

In speaking of the present state of the Irish metropolis, the writer called attention to the violations of æsthetic principles displayed in many of the public buildings and monuments, but at the same time referred to the number and extent of the public squares, and to the breadth of the streets as points worthy of emulation in other cities.

After describing the various antiquities of Killarney and county Wicklow, Mr. Darbyshire concluded by giving a detailed account of the famous round tower and seven churches of Glendalough.

The paper was illustrated with diagrams and sketches. A discussion followed upon that *quæstio vexata* of antiquarians, the round towers and their original use.

THE COLSTON HALL COMPETITION.

WE have received several communications, couched in no measured terms, with reference to this competition. There seems to be a very general opinion that the whole of the drawings submitted should be publicly exhibited; the Committee would do well to accede to this desire, if only in their own justification.

THE IMPROVEMENT OF THE EXHIBITION APPROACHES.

ON Tuesday Mr. Cowper moved for leave to bring in a Bill to authorise the formation of a road between Kensington-gore and Bayswater, and to apply the proceeds of the Metropolis Improvement Fund Account towards defraying the cost of the construction of such road. He said that it was with considerable reluctance he moved the House to entertain this Bill, not merely because it was always unpleasant to deal with questions of taste in Parliament, nor because the question was mixed up with parochial and metropolitan jealousies, but chiefly because the office he had the honour to hold for one of its special objects the guardianship of the beauty and amenity of the parks, and it was his desire to protect the parks as much as possible from any such intrusions as would diminish the recreation and enjoyment which they afforded to her Majesty's subjects. A very strong case, however, had been made out against the existing state of things. For the last two years deputations had waited upon him to represent the urgent necessity of a new road between Kensington-gore and Bayswater, not merely with regard to the special requirements of this year, arising from the Great Exhibition, but with reference to the permanent wants of the west of London. The situation of the South Kensington Museum, the Horticultural Gardens, and the Great Exhibition, part of which building would be permanent, under the care of the Society of Arts, made it very important that a good road should be formed between the points he had named. On the other hand, it was very necessary that the parks should be preserved for the enjoyment of the public, and that no detriment should be caused to their appearance. In reply to a statement made that the road would not be ready for the Exhibition, he must say that he had consulted engineers of eminence, and that they assured him a permanent road could be constructed before the first of June, at which time the general resort to the Exhibition might be expected to commence. A contractor had proposed to construct it within three months on the penalty of receiving no pay should he fail in his engagement. Had the Bill been received with favour, and allowed to pass rapidly through the House, he would have had it ready at the 1st of June, but he found that a strong desire existed to retard it. In consequence of this feeling he had taken care to insert in the Bill powers to make a temporary road, but he wished, as the matter had gone so far, to ascertain the opinion of the House as to whether there should or not be a permanent road. Subsequently, Mr. Cowper said, with regard to observations that had fallen from the member for Marylebone, that he (Mr. Cowper) felt himself in the position of the camel whose back was broken by the last feather, for he at least expected that he should have received the support of Marylebone. Then, with regard to what had fallen from the noble lord opposite (Lord J. Manners), he begged to remind him that he was within his province in proposing a measure relating to the Royal property, and the Metropolitan Board of Works had no jurisdiction in the matter.—(Hear, hear.) He had received a vote of thanks from that body for having introduced this Bill. Seeing that the Metropolitan Board of Works and the members representing the metropolis differed in their views, and that the Bill seemed to be generally distasteful to the House—(cheers)—he felt he could not do better than withdraw the Bill.—(Cheers.) He should follow out the other branch of the subject, namely, the arrangement to be made for the temporary passage of vehicles, by proposing an estimate for the sum that would be necessary for that purpose.—(Hear, hear.)

The Bill was then withdrawn.

We have been requested to publish the following Report of the Thoroughfares' Improvement Committee:—

To the Vestry of Kensington.

Your Committee, in again reporting on the important subject of the improvement of the public thoroughfares connected with this parish, especially in relation to the requirements of the forthcoming Exhibition of 1862, deem it advisable to refer to the whole of their proceedings.

With respect to the Brompton-road improvement, a plan was submitted purporting to come from the Committee of Council on Education, showing an improvement to this thoroughfare by taking down certain houses and buildings, from Nos. 11, both inclusive, in the Brompton-road, interfering with the parochial schools, and taking down the houses in Queen's-buildings, between Queen's-gardens and New-street, taking down the chemist's and stationer's shops at the corner of Cheval-place, taking down Brunswick-place, and the lodge to the Oratory, besides interfering with the pleasure gardens of Brompton-square and Brompton churchyard; this comprehensive plan would have cost at least £50,000.

Your Committee being desirous of ascertaining the intentions of the Council on Education, as to raising funds for this object, and with a view to putting the proposed plan to a practicable test, directed your clerk to open a correspondence with the Committee of Council on the subject. A letter, dated the 24th October, 1861, was accordingly addressed to the Committee, and to it a reply was received simply stating that the matter would be submitted to their Lordships. After some time had elapsed, a second letter was addressed to the Committee by your clerk, to which a reply was returned to the effect that their Lordships had not up to that time arrived at any decision.

Your Committee, failing to ascertain how the Committee of Council on Education propose to carry out the scheme set forth in the plan proposed in their office, or whether they would make any contribution in aid of the proposed improvement, considered it advisable to address a letter to the Royal Commissioners for the International Exhibition of 1862, which they accordingly did; the letter was dated the 3rd December, 1861, and forwarded, with a copy of the correspondence with the Council on Education, but to the letter no reply of any kind has been received.

Your Committee having entirely failed to obtain the co-operation of the two public bodies most interested in improving the thoroughfares of Brompton, and upon a plan being prepared by Mr. James Broadbridge, your surveyor, showing a comparatively inexpensive way of improving the width of the road by taking off a part of the land in Queen's-buildings, not built upon, and 20 or 25 feet in width of the apparent waste land in front of Brompton-row, also the open space in the front of Michael's-place, now only enclosed by railings, directed that officer to place himself in communication with the owners and lessees of the property in question to ascertain how far they would be willing to meet the public requirements; that officer reported that he had seen the owners, solicitors, surveyors, and others concerned for the property, and, after considerable trouble, he found that the amount of compensation required in taking it as a whole is far beyond the limited fund at the disposal of the vestry; he was, therefore, unable to negotiate for the land in question, or advise the vestry as to what course they should adopt without obtaining a special Act of Parliament

for that purpose, and for the reason before set forth, it could hardly be expected that the vestry would consider it within their province to adopt such a course.

Your Committee would here remark that this road, the improvement of which is so important to the public safety and convenience during the forthcoming Exhibition, is a turnpike-road entirely under the control of the Metropolis Roads Commissioners, the vestry only having the care of the footpaths on either side. It appearing that the said Turnpike Roads Commissioners have powers under their Act to widen and improve the roads under their jurisdiction, it was to be hoped that they would come forward and invite the assistance of the other public bodies to aid in carrying out so important an improvement.

Your Committee consider the parish of Kensington has shown itself quite disposed to assist in a practicable and reasonable way in the improvement of the Brompton-road, but has also felt itself quite uncalculated upon to carry out, single-handed especially, as the parish of Kensington is by no means the only or the most largely interested body in the matter; the Metropolitan Board of Works, the Turnpike Roads Commissioners, the Committee of Council on Education, the Exhibition Commissioners, and the Royal Horticultural Society are all directly concerned, and whenever so large and expensive an improvement is carried out it must be by a general and fair arrangement among all the parties that will eventually benefit from it—turnpike roads.

A deputation of your Committee waited upon the Metropolis Roads Commissioners on 31st January, and by way of trial ventured to suggest that probably the vestry would be willing to contribute an annual sum of £3,000 in consideration of the Commissioners removing the turnpike gates and side bars throughout the parish of Kensington, and although this sum is admitted not to be sufficient for the repairs of the whole of the turnpike roads within the parish, it is to be recollected the Commissioners are now collecting more money at the gates in Kensington parish than is absolutely required for keeping the roads in repair in these trusts, that a very large and expensive road running through the rich parish of Paddington, and also the Great Western road running through the parishes of St. Margaret, Westminster, and St. George, Hanover-square, are now kept in repair without any charges to those parishes by the sums collected at the gates in Kensington parish, and those beyond.

Upon the proposition being submitted to the Commissioners by the Chairman of your Committee, the deputation was invited to submit the heads of a Bill to Parliament for the consideration of the Commissioners, embodying the said proposition. In accordance with the request of the Commissioners your Committee have directed your clerk to prepare draft heads of said Bill and append the same to this report.

Your Committee's attention having been called to Palace-gardens, which is a private road leading from the Uxbridge-road to the Great Western-road, and not allowed to be used in common for cabs and other public conveyances, consider that the opening of this road during the time the International Exhibition of 1862 shall continue, will assist in affording considerable accommodation to the public generally, and with this view your clerk, under four directions, has communicated with the office of her Majesty's Woods and Forests on the subject to see if any and what arrangement can be arrived at for that purpose.

HOUSE OF COMMONS.
THE NATIONAL GALLERY.

LORD ELCHO asked the Chief Commissioner of Works whether there was any truth in the report that plans for a new National Gallery, to be erected on the Burlington-house site, had been prepared, and that a vote for its erection was to be proposed to Parliament in the present session; whether, in the event of such being the intentions of Government, the plans and elevation of the proposed building would be exhibited before any vote was proposed to Parliament; and whether any decision had been come to as to the purpose to which the present National Gallery was to be devoted.

Mr. COWPER said that the enlargement of the National Gallery in Trafalgar-square had enabled the trustees to receive within the existing building the Turner Gallery, in strict fulfilment of the bequest of the late Mr. Turner. The buildings in Trafalgar-square were now so full that some arrangement must shortly be made to give increased accommodation to the national pictures. The subject had, of course, been very much under the attention of his department, and all possible means of accommodating those paintings had been considered, but at present the Government were unable to come to any decision whatever in the matter. In reply to Lord ELCHO, who asked whether, in the event of any decision being come to, the plans would be laid on the table of the House before any steps were taken towards carrying them into execution, Mr. COWPER said, that forms part of the subject on which the Government have not yet come to a decision.

LEICESTER-SQUARE.

In answer to a question by Sir W. JOLIFFE as to whether there was any prospect of an improvement being effected in Leicester-square,

Mr. COWPER admitted that that locality was the stigma and opprobrium of London; but he was not able to give a satisfactory account of the origin of the present state of things. It appeared that there was some doubt as to the legal estate in the soil of Leicester-square; and all parties concerned in the ownership of the square agreed that they would allow what they were told would be a temporary and ornamental building to be erected in the centre of it. That building had certainly not justified their expectation with regard to its being an ornament, and it was likely also to deceive them on the point of its permanency. He certainly should be glad if there were any power which could be exercised on behalf of the Crown to put an end to that state of things, but he was not advised that it was so. At the present moment he was unable to hold out any prospect of the termination of the very unsatisfactory and disgraceful state of the square. He could only say that if he saw any way to make Leicester-square as ornamental as the other squares of the metropolis he should be glad to adopt it. He should think that the last thing any one could wish to see would be the squares of London built upon. He should rather think that the owners of squares would follow the example of the benchers of the Temple, and throw open the grounds, giving the public every facility to enjoy themselves in them.

VERSAILLES.—M. de Saint-Marsault, Prefect of the Seine et Oise, has just had posted up in Paris notice of a competition for the construction of an hôtel de ville and a gendarmery barrack at Versailles. Four prizes of 3,500fr., 2,000 fr., 1,500fr., and 1,000fr., accompanied by a gold medal, will be awarded to the four best plans; the fifth will receive a gold medal only.

ROYAL COMMISSION TO INQUIRE AS TO THE HEALTH AND SAFETY OF MINERS.—The Queen has been pleased to appoint the Right Hon. Lord Kinnaird, K.T., the Hon. Fulke Egerton, Nicholas Kendall, Esq., Henry Austri Bruce, Esq., John St. Aubyn, Esq., John Davie Ferguson Davie, Esq., Edward Headlam Greenhow, M.D., and Philip Henry Holland, Esq., to be Her Majesty's Commissioners to inquire into the condition of all mines in Great Britain to which the provisions of the Act 23 and 24 Vict., c. 151, do not apply with reference to the health and safety of persons employed in such mines.

THE REMOVAL OF THE MUSEUM COLLECTIONS TO SOUTH KENSINGTON.*

THE principle of exhibition, adverted to in our last, is by typical arrangement. In the Zoological Department this implies a selection of such specimens as may be sufficient to illustrate the main points of interest found in connection with particular groups of animals. There would be an outline of the classification of the animal kingdom, giving such a display of the more prominent divisions of form and colour as would be calculated to strike the casual spectator.

This limited exhibition is the only one that can be of real service to the mass of the people, who can take a holiday only by the sacrifice of a day's earnings. We should be glad, indeed, to hail any prospect, however distant, of the number of public holidays being increased. Philanthropy would find an ample field for its labours in this direction; and the man who should be fortunate enough to originate any plan for adding to the opportunities of harmless recreation within reach of the working classes, would be worthily regarded as an eminent public benefactor. If we are sincerely anxious to benefit the people, we should endeavour to place before them, as compactly as possible, what we have to show, and, moreover, bring the exhibition within the compass of a not too fatiguing day's work.

If the Trustees would authorise the Keeper of Zoology to arrange the Bird Gallery on the typical plan by way of experiment, the public would then be able to judge of the effect. The better to exemplify what is meant by "typical" arrangement, we may take the family of Corvidæ. Thus, as types of species within this group, we should have a crow, a rook, a jackdaw, and a raven, without attempting to represent by mounted specimens all the crows, all the rooks, all the jackdaws, and all the ravens in the world. These, and analogous varieties of other birds, would, nevertheless, be carefully preserved, unmounted and stowed away in drawers, to be forthcoming (under proper restrictions) at the demand of the scientific student. Naturalists prefer to have an unmounted specimen to handle and examine, and themselves keep their own collections in drawers glazed at the top. Constant exposure to light is found to be most injurious to the bright colouring of birds' plumage, and peculiarly ruinous to the delicate tints of shells and insects. In fact, all objects are affected more or less, save only the birds above alluded to, which remain black for ever. Our present system ruins objects by exposure, and calls for perpetual expense to supply the place of worn-out and defective specimen.

Out of 2,000 genera of birds, in many of which the differences are so trifling as to be detected by the eye of the naturalist alone, Professor Huxley considers that a large allowance would be made if he selected 1,500 species as types. Not only would these 1,500 species give the ordinary visitor a very full idea of the varied forms of birds, but they would enable any one who had made himself acquainted with them to say at once, on seeing any bird, where its allies might be found, and to what family it belonged. The arrangement would be as follows:—The wall cases would be allowed to stand, but the other objects which cover the floor would be cleared out, and in their place would be two lines of glass cases, leaving 10 feet clear for each of the three passage-ways. Above the wall cases would run a gallery fitted up with store cases and drawers, and at intervals there would be doors communicating with rooms used as studies.

It is well known that, at present, the Museum is really accessible to scientific persons only on alternate days; but, by separating the great mass of the specimens as a scientific collection, which the public would not care to see, and need know nothing of, that collection would be always available to students, while the general or typical collection could be always open to the public. Some idea may be formed of the vast space afforded by the present wall cases in the bird gallery, when it is stated that it is equal to the area allowed for the exhibition of the whole of the British fossils in Jermyn-street.

Within the walls of this gallery all the known birds could be so arranged as to form a most fascinating exhibition to the general public, and this room would, by the adoption of the typical plan, be amply sufficient to hold all additions for the next hundred years.

We have dwelt at some length on the Natural History Department, because collections within this section of the Museum are under sentence of transportation, and because visitors are known to take a greater interest in these than in others, for a proper appreciation of which some special knowledge and education are required. We have gone into detail because we deem it most important to decide whether we shall go on spreading out collections to an indefinite extent, or whether we shall be content with giving a general idea of natural forms, reserving in store for the use of studious and curious persons more minute and extended representations. If the resolution of the Trustees be carried into effect, a very small space will be set free, not amounting, in fact, to 13,000 feet. This proposition of sending away mineralogy and geology is a mere makeshift. It will do nothing towards relieving the pressure of the accumulations on the space within the Museum. For this reason we can but regard the transfer as a simple do-nothing, or (what we have already hinted) as another item in the scheme for the aggrandisement of South Kensington.

The ruling idea which has long guided the heads of departments has been that of obtaining and exhibiting everything. It is to this comprehensive notion that the deadlock to which we have now come is mainly due. In the Department of Antiquities, no less than in the Natural History Collections, we should advocate—at least for the future—limited exhibition. Let any observant person enter the galleries devoted to antiquities, and watch the effect produced on the majority of visitors, and we are much

mistaken if he will not find it to be listlessness and weariness. After all, is this to be wondered at? An untaught man is unable to see anything worth looking at in a torso, or other ruined sculpture; and even those of us who happen to take mere interest in these things, from education or natural bent, cannot affect to deny that the antiquities in the Museum are, for the most part, not objects of high art, although they possess great value as expressions of human civilisation and religious feeling from the most remote ages and in various countries.

There, perhaps, was never a period in which fewer independent opinions were formed than at the present day. The luxuriance of the press saves men from the trouble of thinking, if our systems of education have attempted, in the slightest degree, to teach them that their first care should be to cultivate the faculty of thought. We must be content to take human nature as we find it, and one of its most conspicuous qualities is readiness to cast about for a faith, a policy, a leader. It devolves on us, then, to show the mass what they ought to admire by placing it before them; and thus our collection of antiquities may be made ancillary to the education of the people, by imbuing them with a taste for beauty of form. Indiscriminate touring through rooms filled with unintelligible sculpture will teach a man as much, or as little, as a book written in an unknown character. Archæological remains, however interesting and however widely displayed, bear no comparison at all to a well-chosen exhibition of the highest art in a few rooms. It is concentration of merit at which we should aim. While fully recognising the desirability of arranging the antiquities in chronological sequence, we should, in the interests of the public, ask for one room or hall devoted to great masterpieces of art. Let us have in London a match for the Tribune of the Uffizi Gallery, if all chance of getting a Braccio Nuovo is hopeless.

Although, as we have said, we should be glad to see a chronological arrangement of works of art, we do not lay so much stress on its necessity as some. The anomalies which exist in the present disposition of the saloons are of little practical importance in the eye of the scholar, and tend but slightly to confuse his judgment. If the nation were called upon to erect a building that should contain the present collections, no other arrangement than one in order of time should be adopted; but, as a vast assortment of sculpture—much of it of gigantic size—is *in situ*, some regard must be had to economy. The few facts elicited in one instance of contemplated removal are not encouraging. The head of Thothmes III. was proposed to be moved a few feet from its present position, and the estimated cost was set down at £70. The Trustees did not feel justified in sanctioning this entail, and the head still stands in the gangway at the end of the great gallery. The circumstances of this case are described as altogether special, for the monument is a block of granite weighing six or seven tons; but it is obvious that the removal of many of the largest objects in the Museum, which would be necessary to obtain a strict chronological sequence, could be accomplished only at great cost and probable risk of injury.

We cannot now do more than touch briefly on some of the more prominent points connected with the plethoric state of the British Museum. We shall gladly witness the clearing away of the glass sheds that now mangle the fine portico, but their presence reminds us of a cardinal rule of conduct that should guide the Trustees for the future. Rejoiced as we are at knowing that this country possesses the sculptures of the famed Mausoleum, we are fully certain that great discretion should be observed in the display of these marbles. Many—unhappily, too many—are in mutilated fragments, and we can only repeat to Mr. Newton what we have already said in dealing with Professor Owen's section, that the Museum cannot find space for that liberal exhibition which he evidently contemplates. Many broken pieces were sent home from Halicarnassus and Cnidus to see whether they could be made to fit one another, and, consequently, there is not the least necessity for their being exhibited. If these fragments are preserved in some part of the building, they need not be in the public portion, as they will be interesting only to the antiquarian. Let them be in the basement, where they will be accessible to those who wish to see them. That the finest and best preserved of these marbles may most worthily find a place among our collections we unaffectedly believe. All we ask is that sound judgment be exercised before we stand committed to an extensive range of rooms whose contents will present few points of attraction to general visitors. It is manifest that a comparatively limited space is required to store sculptures for purposes of artistic reference, and we dare challenge contradiction to the statement that the public will be in no way benefited by the construction of huge and lofty galleries with ample thoroughfares projected for the admission and circulation of holiday crowds. Far before the merits of this or that plan of enlargement or arrangement stands, as we conceive, the principle on which we shall proceed in adding to the Museum.

Considerable diversity of opinion would, probably, be found as to the point at which excavations of ruined cities should cease. If no limit is placed on archæological researches; if the nation is prepared to pay for the disinterment of sculptured fragments, illustrative of every chapter of ancient history, every fresh extension of the Museum will still prove insufficient. It is clear that, postpone it as we will, the day will come when the State will be constrained to cry "enough." For ourselves, we are strongly disposed to think that the time has even now arrived when a stop should be put to these explorations, at least so far as they compel the necessity of finding exhibition space for their results. The success which has attended the mission of Mr. Newton very naturally induces him to look forward to accessions from Asia Minor and the Archipelago, and from Cyrenaica; but will that gentleman, or any one, point out the corresponding advantage to be gained in return for a great outlay which will

* Concluded from page 102.

entail still further and further enlargement of the Museum? In some quarters we shall be thought guilty of downright heresy when we assert that the multiplication of fragmentary sculpture—belonging not to the best periods of art—is of no real use even as a study. Is it not the fact that these works are brought together from the four winds of heaven with no view as to their actual artistic value, but rather to justify the use of high-sounding terms, such as “the history of the art-emanations of the human mind throughout all time?” The history of the human mind! what cruel gaps occur! How much is left to conjecture! Rich as we are in Egyptian remains, how faint is the idea we can gather from them alone of the character of Egyptian art. Colossal and perdurable are its features, we see; but to realise its stature and to trace its descent is granted to those only who can gaze on its embodiment in the land of its birth and in the complete grandeur of its types at Memphis and at Thebes, in the Pyramids and in the mighty temple of El Karnak.

If our Government could take a more direct interest in art, or had power to encourage, by grants of money, the publication of works illustrative of ancient remains, every purpose would be served, and the nation would not be called upon to provide buildings for vast collections, and to pay an additional staff of attendants to dust and keep them in order. Of course, we ought to lose no opportunity of obtaining fine sculptures. All we say is, that when sculptures are much broken and defaced, and do not belong to a good era of art, we should be satisfied with carefully drawn representations of them, and indifferent to the possession of *ipsissima corpora*. With such facilities as we can command by the aid of photography we might, at a small proportionate cost, amass a most faithful and valuable series of illustrations, while we reserved ourselves for the purchase and conveyance of works produced in the best periods.

The Museum has so completely outgrown all previously conceived ideas of its originators, that the very purpose of its foundation is now matter of dispute. Naturalists assume that it was founded as a Natural History Collection, but Mr. Panizzi contends that the very name given to the chief officer—namely, Principal Librarian—shows that the Act of Parliament which called the Museum into being considered books, and not natural history, as the main feature of the institution. The account of its origin is this. Sir Hans Sloane left his collections to be offered to the nation for £20,000, with contingent provisions in case of refusal. Parliament, in 1753, voted that sum, and by the same Act bought also the Harleian manuscripts. By uniting these purchases with the Cotton collection of manuscripts, which had long been the property of the nation, the British Museum was established. Whatever might have been the original destination of the Museum, its triple union of literature, science, and art makes all classes join in the wish to retain it intact in its present position. Indeed, it would be difficult to over-estimate the value of that connection, or the convenience afforded to persons devoted to science and art of meeting round a common centre—our magnificent national library.

Among the objections to the removal of the Natural History Collections not the least is the formation of a special library, which, the Committee state in their report, would cost £30,000 at the present time, while the daily increase in the literature of natural history will necessitate further expenditure, from time to time, on works which frequently contain costly illustrations. Is the country prepared to incur the burden of supporting two immense establishments, with all the concomitant cost of attendants and buildings? We have yet confidence in the independent members of the House of Commons that they will not allow this monstrous job to be perpetrated. The scheme of removing the National Gallery to the same favoured locality met with a signal defeat. We observe that Lord Elcho—to whom we are chiefly indebted for the retention of the pictures in the centre of London—intends to move that one of the Ministers of the Crown shall be held responsible for the estimates voted for all public institutions. That something must be done is clear. Indeed, nothing but this coquetting with South Kensington has prevented the question from being settled in the only rational and sensible manner. As the land which surrounds the British Museum happens to belong to one proprietor, there can be no difficulty in coming to terms with him. The wisest plan would be to purchase the whole at once, and make use of it as occasion requires, not (as we have endeavoured to show) in a wild, prodigal style, which will reopen for our descendants the question which ought now to be set at rest for ever; but with forecast and judgment, proceeding with the fixed determination to perfect one of the grandest schemes which it has ever fallen to the lot of any nation to apply, and to complete a building, the contents of which shall be the wonder and delight of the people, and the cynosure of all who are devoted to art, science, and letters.

COMMITTEE ON FIRES.—A select committee to report upon the subject of fires in the metropolis has been nominated. It includes Mr. Hankey, Mr. Cowper, Mr. Locke, Mr. Cave, Mr. H. B. Sheridan, Mr. Cubitt, Mr. Lewis, Mr. Peacock, Sir J. Paxton, Mr. Benyon, Mr. Alderman Salomons, Mr. Tite, Mr. W. Miller, Mr. Vance, and Mr. G. Clive, with power to send for persons, papers, and records.

THE LONDON CO-OPERATIVE OIL AND COLOUR COMPANY.—Mr. Thompson, the appointed manager of the works of this proposed society writes, with reference to a notice of the Company which appeared in our Number of the 14th instant, that the company really deserves “the support of architects, who, as a class, are noted for share transactions.” However that may be, it is very rarely that we can take it upon ourselves to “recommend” our readers to take shares in any company. The dividend promised is, we observe 100 per cent., and the address of the manager, 8, Colet-place, Commercial-road.

GASWORKS AT CHERTSEY.—The Chertsey Gas Consumers Company offer £10 for the best plan and specification submitted to them for works to make and 2,000,000 cubic feet of gas per annum.—*Engineer.*

PROFESSOR SMIRKE'S LECTURES ON ARCHITECTURE AT THE ROYAL ACADEMY.—LECTURE V.

LAST week I addressed to you some remarks on the subject of form as it affects design in exterior architecture. I propose now to submit to you the result of my experience and reflections on design in interior architecture. These two subjects, as I then stated, readily admit of separate consideration, and, indeed, almost demand it; for the aims, as well as the means, of the designer in each case are widely different.

In determining the external features of a building we have to consider, besides the character of the building itself, various collateral circumstances—such as the nature of the site, the character of the surrounding scenery, or of the adjacent architecture. It is far otherwise with internal architecture; there, we may disregard all these collateral circumstances, and limit our attention to the individual character of our subject.

In designing the interior of a building, however, there arises a new and peculiar source of difficulty. Considerations of convenience come in to embarrass our pencil and to complicate our task; architectural effect and fitness of arrangement will often militate most inopportunistically against each other. We must needs have a door, perhaps, where we would fain have had solid masonry; and light, perhaps, can only be obtained from the east, whilst æsthetic considerations may point to the west as preferable. In fact, to reconcile these two important, yet, often incongruous objects, forms one of the severest trials of an architect's skill and patience. The art of conveniently arranging the various parts of a plan, so as to fully adapt them to their special purpose, is truly one of primary importance. It is, indeed, obvious that all our labour and art may be wastefully expended if our plan be not such as to afford a convenient collection of its several parts. To lay down a good plan, therefore, becomes the first duty of an architect, and demands his first and most earnest attention. The subject of a convenient arrangement of a plan cannot be entered upon with propriety here. I will, therefore, on this point confine myself to the general observation that simplicity and directness are cardinal virtues in all architectural arrangements. Avenues should be as straight, as short, and as obvious in their course as possible. The rules for the moral conduct of a man seem very applicable to this branch of our art; his ways should be clear and obvious, they should be free from ambiguity and uncertainty, without tortuous or dark places. The right way is always the straightforward way; but, when a turn is necessary, let it be one that cannot be mistaken.

The first impression on entering a building should be such as is becoming its special purpose, and, if possible, suggestive of it. The temenos of a Greek temple was well calculated to give an impressive air of sanctity to the temple itself, by excluding from view all incongruous objects. A similar feeling, perhaps, led the architects of early Christendom to form that peculiar fore-court, or atrium in front of the naos, of which a few examples still remain. The Basilicas of San Ambrogio at Milan, and of S. Clemente at Rome, are interesting examples. There can be little doubt that the builders of that devoted age were influenced by subjective considerations of this kind, although the ritual appropriation of this portion of the building was to receive the catechumens of the church, and to afford a suitable place where the candidates for baptism might present themselves. At all events, a very powerful effect must have been produced upon the eye and mind by thus shutting off from view the outer world, and concentrating attention on the sacred structure about to be entered.

It was, perhaps, a similar motive, a legitimate artifice for the purpose of strongly impressing the mind of the worshipper, that led our old church builders usually to form their doorways of very moderate dimensions. Great emphasis was ordinarily given to the western, and often to the lateral doorways, by exterior decoration, but the actual opening of the doorway is usually comparatively unobtrusive. The natural effect of this is to produce a surprise at entering, and so affecting the mind with awe.

Turning now to domestic architecture, we shall not fail to recognise the efforts made by the early Italian artists in designing the entrance halls of their noble palazzi, to secure a favourable first impression. Their halls are of large dimensions; treated in a broad and grandiose manner, without much ornament, but usually embellished with ancestral statues and warlike trophies.

This first entrance-hall is, however, sometimes made subordinate to a capacious inner central hall, giving means of communication with all the principal apartments; a happy idea, alike productive of social convenience and architectural effect. Palladio's celebrated Villa Capri is a specimen of eminent skill that has been productive of a host of similar examples, not only in the land of its birth but even in our country, as at Cobham-hall, and other of our princely country mansions.

These inner central halls may, perhaps, be regarded as lineally descended from the interior peristyle of the Romans, which, as we see at Pompeii, formed the ordinary place of family resort, giving access to all the adjacent apartments.

The cloisters of conventual buildings were, apparently, an amplification of the same idea, and derived from the same source. Whatever the phase of art, whatever the mode of treatment, whether arcaded or columnar, or both, these columns afforded occasions for most picturesque and pleasing designs. At those interesting remains of Roman magnificence called the Villa Mecenas, at Tivoli, we have a remarkable instance of the union of the arcade and colonnade, forming a cloistered ambulatory, an arrangement by which we have the greatest possible variety of outline and *chiaroscuro*.

I proceed now to an important feature of almost every structure destined for man's habitation—I mean the staircase. In designing this often very picturesque feature, it must be admitted that we owe little to ancient examples. I am unable to cite any instance of an internal staircase of very striking effect in any classical remains. Magnificent exterior flights no doubt occur, and in Belli's description of the Greek Theatres of Crete we see evidences of the existence of double returning flights, similar to those so common in modern architecture, having each flight enclosed within solid walls. The newel stair was certainly of purely Greek origin. A perfect example exists in good preservation among the ruined temples at Selinuntum; its dimensions, however, are extremely small, the diameter being only 6 feet 4 inches. The domestic architecture of Rome seems to have required little aid from interior stairs, and even in so sumptuous a building as the Coliseum, where 40,000 persons had to be provided with ready access to very high levels—built, too, when Roman power and art were in their zenith, expressly to gratify the extravagant love of display of the Roman people—we still find no very pompous staircase, although, it is true, the stairs are numerous, and, as I mentioned to you two weeks ago, executed with great masonic skill.

Among the buildings that remain of earlier Mediæval art, it is still difficult to point to any very fine staircase.

Highly effective flights of stairs no doubt occur. There are notable examples at Assisi, and at Lucca, where there is a flight of 7 or 8 feet wide, with a marble arcaded balustrade, sufficient to show that the builders were to some extent aware of the fine effects attainable by the artistic treatment of this portion of their plan. Still the examples are rare; I know of none in this country of greater importance than that in the cathedral close at Canterbury.

The newel stair was certainly the most usual form of stairs in buildings, even of most important character, during the middle ages. The example at Dover Castle, known to most of us, is of large dimensions; that at Tamworth Church is, perhaps, unique in this country, as presenting a double spiral stair round one newel. So characteristic is the newel stair of Mediæval architecture, that the partially detached turrets which usually contain them are among the most marked features of the style throughout Europe. Perhaps no city contains more remarkable examples than Nuremberg. Wherever this turreted staircase occurs, it always constitutes a pleasing object, imparting an agreeable variety of outline to the composition.

As peaceful arts advanced [and men ceased to look for security in embattled buildings] the artistic builder soon perceived the opportunities afforded by flights of stairs for pleasing and pictorial effects. Nor could he be insensible to the extreme inconvenience of the Gothic spiral form of staircase, where, whatever the length of the steps, there necessarily can be but one place offering a convenient proportion of the tread to the riser.

In the quiet times of the later Tudors staircases in this country began to assume their proper character, and there is no part of our old Elizabethan mansions on which builder seem to have dwelt with more pleasure, or on which they were more wont to exercise their playful fancy, than the staircase.

But while those fantastic works were in course of erection which we see at Crews Hall, Hatfield, and elsewhere, especially in Germany, the more polished artists of Italy were erecting

staircases of magnificent proportions and bold character, yet of a totally different character, and this is a phenomenon well worthy of observation. At the very time when those rude and rather grotesque works were being executed here, there existed in that land of art, Italy, staircases designed by the great masters, which were consummate models of grace and refinement, like that at S. Giorgio, at Venice, by Palladio.

The genius of each people is well typified in this diversity. Bold, irregular, and unrefined, such were the Elizabethan and Jacobian schools; whilst the works contemporaneously executed by the Italian school were grave, symmetrical, and simple.

I am well aware that the study of this contrast may lead different minds to very different conclusions. The picturesque and quaint exuberance of our own old manner of designing the stairstrading, for example, seems calculated to win the admiration of the painter, while a different feeling may prevail in the colder temperament, which is forced, as it were, on the architect by the very nature of his profession, working, as he does, not on canvas, but in solid masonry. As time advanced the sobriety of manner which distinguished Italian staircases (and, indeed, architecture generally) in the fifteenth and early part of the sixteenth century, gave way, and staircases began to be designed in a capricious, fantastic manner. Excess of freedom, and a wonderful power of construction, led ultimately to the erection of staircases fit rather for the scene-painter than the architect.

Greatness of dimensions, however, was a merit to which all were alive, and we, therefore, find in Italy staircases of a size almost extravagant. The staircase in the Albergo del Poveri, at Genoa, is 115 feet long by 63 feet wide, and that in the Royal Palace at Naples measures no less than 163 feet by 85 feet. The Renaissance school, to which I am more particularly referring, employed two very different types of staircases, each, perhaps, equally susceptible of beauty—one wherein both ends of the steps are supported by solid walls, the other where one end only was let into a wall. As notable and familiar examples of the first, I might refer to the palaces at Versailles, Fontainebleau, and the Louvre, and our own Reform Club. Their form of stairs is capable of great dignity as well as beauty; but it has some inherent inconveniences. The raking solite of each flight is a source of difficulty in design, and gives rise to some unpleasant effects. They are wanting, too, in lightness and freedom, whilst persons ascending and descending do not see each other until they abruptly meet. The staircases of the second type are, on the other hand, far more free and open, and the eye expatiates over the whole area at once. It is almost needless to give examples of this latter familiar form. The elegant work of Palladio, to which I have already adverted, at Venice, and the stupendous example at Naples, will illustrate the type. I might add a third variety, viz., where there is no turn, and the stairs extend in a continuous straight line. The Royal Library at Munich has a staircase on this plan. The Scala Regia, in the Papal Palace at Rome, is another example, presenting an extremely striking architectural scene. The proportions are colossal, and the flight is flanked by a stately colonnade.

The effect of this staircase is artfully heightened by a peculiar expedient. The flanking walls are not parallel, but gradually approach each other, the width at the bottom being 10 feet wider than at top. The object no doubt was, by an optical illusion, to increase the apparent length of this avenue of columns—an architectural fraud, in fact, ingenious, but hardly to be recommended for imitation.

It is, I think, to the second type that I would point as most deserving approval. Schinkel's great work, the Museum at Berlin, is a favourable instance of it; and a still more colossal staircase at the same building has recently been erected by Stüler. Its dimensions are about 140 feet by 70 feet, the walls affording a magnificent field for the frescoes of Kaulbach.

The principal error to avoid in these great open staircases is an appearance of tediousness in mounting. It should never be overlooked that the great—indeed, the only legitimate object of a staircase—is to facilitate our way, up or down; and no display of architecture will reconcile us to any unreasonable amount of indirectness in our course. Those large, straggling, tedious stairs up which we are occasionally compelled to work our way, and which, by following, in their turnings, along all the four sides of the staircase, seem to lead us in any direction rather than that which we desire to take, are at once unsightly and inconvenient. Before I finally quit this subject, I desire to commend to your observation that a simple flight of even a few steps will be found, in the hands of the artist, capable of an agreeable effect. It would be easy to multiply illustrations, but I will confine myself to two or three simple instances derived from that land of art, Italy. At the entrance to the Incurable Hospital at Genoa, some local circumstances compelled the architect to lead us by an indirect line, the public street not being at right angles with the direct line of access to the interior. So far from ignobly submitting to this as an inevitable awkwardness, the architect struggled, successfully, to give an apparent, as he could not give a real, symmetry to his plan, by the picturesque contrivance indicated on the drawing.

To descend to a still humbler illustration, I would adduce an instance occurring at a small, unpretending house at Boulogne. In a straight passage of moderate width it was necessary to rise 4 or 5 feet. The obvious and prosaic course to adopt was to place so many parallel steps across the passage; but such an artificial mode of proceeding would ill accord with the æsthetic views of an Italian artist of the sixteenth or seventeenth centuries. He accordingly broke his flight of ten steps into two flights of five steps, with an intermediate landing, at which landing he introduced two short portions of ornamental balustrade, thus giving these few steps a positively ornamental appearance, and really assisting the person passing by affording an intermediate means of support.

A third example I noted at a convent in Rome. Here Bernini, whose principal aim at all times seemed to be to avoid insipidity at any cost, entailed, it is true, by the arrangement shown on my sketch, a constant source of inconvenience upon all succeeding ages, as long as the stairs may last; but he achieved his great object of avoiding the abhorred simplicity of a straight flight, and produced a pictorial effect with very small means and in small compass.

These few trifling examples are suggestive; they tend to show that a really inventive talent may find occasion to display itself, even in matters of a very insignificant and unobtrusive nature.

I hasten now to enter the apartments towards which we are proceeding. But first let us parley for a few minutes on the corridor that we have to traverse before we enter them.

Good taste, and, indeed, common sense, seems to suggest that the architectural aspect of a passage should be somewhat conformable in style and treatment with the more important object to which it leads, be it church or chamber. The eye and the mind would thus be, as it were, prepared for, and attuned to, the subject upon which it is about to be exercised; care, however, always being taken to keep this passage subordinate and subdued, so that there may be no risk of disappointment. Many modes present themselves of giving architectural effect to this passage: variety of light and shadow is an important means of doing so; we all feel the beautiful effect of this variety in natural scenery, those glimpses of sunshine, those alternations of gloom and cheerful daylight, so charming in a forest scene; and analogous effects are obtainable in our own art. A long passage may be much relieved of its length by a judicious breaking up of the vista with alternations of *chiaroscuro*.

With the same object in view of diverting the attention and relieving the monotony of a long corridor, we may with advantage place some object of interest for the eye to dwell on, such as a picture or a piece of sculpture, at its termination, or at a turn in its course.

The most beautiful passage in the world is probably that which Raffaele executed at the Vatican. Independently of its frescoes, the proportions of its piers and arches give it unspeakable grace; yet, beautiful as it is, the subordination to which I have just adverted has been so well observed, that the stanzes, to which the loggie give admission, lose none of their interest by the contrast. Whilst on the walls and vaulting of the loggie are depicted those graceful arabesques and playful ornaments, the walls of the stanzes, to which it leads, bear some of the grandest masterpieces of the genius of painting.

In the vaulted corridors of the great Flavian amphitheatre we have another remarkable instance of correct judgment. These corridors are strictly consistent in character with the enormous building of which they form a subordinate part; they, in fact, appear to have become not only the type and model on which all other works of a like nature were subsequently erected, but the fertile parent, also, of those beautiful arcades which so frequently court our admiration, both in ancient and modern Italy. These are, it is true, pre-eminent examples which I have cited, and it may be thought that noble works of the highest grade of art offer no available materials for our imitation or study, in fulfilling the humbler tasks that fall to the lot of most of us. It is not so, however: a right principle is applicable alike to great things and small; and I consider that the rule which I have ventured to enunciate—

that in all works of architecture, every passage or ante-room should be conformable in style, yet subordinate in treatment, to the apartment to which it leads—is of universal application. Let us now proceed to those apartments towards which we have been so long advancing.

There are few objects connected with our art that has been more frequently dwelt on by those who have undertaken to be our guides and mentors than the right proportions to be given to a room. Vitruvius led the way, and subsequent theorists have laid down—sometimes very dogmatically—their views of just proportions.

I find, however, in the actual practice of the ablest men such extreme diversity, and I observe pleasing effects producible by the adoption of such widely different proportions, that I confess myself to be somewhat incredulous of all these theories.

Certainly, if beauty could thus be reduced to a formula, and the proper relation indisputably established between the length, breadth, and height of a room, a royal road would, indeed, be cleared for us, most convenient both to those who teach and those who learn. But I cannot hope to furnish you with such a desirable help in your studies. I find rooms of universally admitted beauty, yet of almost every geometrical figure. I have heard the room called the Tribune, in the Museum at Florence, spoken of in terms of rapturous approval for its beautiful form and proportion: this is an equilateral octagon on plan. I have known square rooms greatly admired—for example, the central hall at Cobham is spoken of as the *chef-d'œuvre* of Inigo Jones; this, if I remember rightly, is a cube of 10 feet. This is there that is not charmed with the proportions of the Pantheon at Rome; this, you know, is circular; whilst the Sistine Chapel, upon which all the best art of Italy in its best days was expended, is a triple cube—viz., 133 feet by 44 feet. The truth, I believe to be, that so bountiously have we been endowed, and so liberally have the laws of beauty and proportion been fringed, that there exists, in fact, an endless variety of beautiful forms and proportions.

It is, I think, as little consistent with truth to lay down any one definite proportion as the best, as it is to extol any one particular curve as the line of beauty. Harmony in form is as infinitely various as the harmonies of colour and of sound.

The purpose of a room must always be an important guide in determining the form and proportions of it. The octagon form, for instance, so much affected by our ancestors in planning their chapter-houses, owes its origin, probably, far more to the propriety of that form for a chamber destined for the assembling of the members of the Chapter, sitting in council, than to any intrinsic architectural beauty.

This fitness to its purpose should obviously be among our very first objects of consideration. But it is the diversity of those objects to be kept in view which complicate the task of an architect, and renders it often very difficult.

In a public hall, for example, he has to consider not only its agreeable proportions, but its acoustic properties, its aptness for seeing, its capacities for lighting and ventilation, the most serviceable distribution of its means of ingress and egress, and many other considerations, among all of which he has to attach to each its relative importance, and to determine to what extent one object may give way to another, and where a sacrifice can be made.

Unfortunately for the architect, whilst these conflicting considerations are taxing his judgment, the critic stands by, regardless of all these embarrassments, and tests the beauty of our work by the inflexible rules of the dogmatist on whom he may have happened to pin his faith.

CHATHAM.

IN addition to the extension of this dockyard by the formation of additional docks, basins, &c., the sanction for which was obtained from Parliament during last session, the Lords of the Admiralty have decided on still further improving the dockyard, so as to afford increased facilities for the construction of the iron and other vessels now building at this establishment. This will involve an additional outlay of nearly £50,000, which sum will be applied for during the present year. Of this amount about £20,000 will be expended in improving the dockyard by means of convict labour, the remainder being required for the construction of additional workshops, the erection of new machinery connected with armour-plating the ships building, the enlargement of the second dock, and in other works of improvement. It is also intended to construct five new docks of a capacity larger than any at either of the other royal dockyards, together with three large basins, the largest of which will be upwards of thirty acres in extent. A considerable sum is also to be devoted to deepening the river from Sheerness to Chatham Dockyard, in order to provide a channel-way 600 feet in width, with a depth of 31 feet. The works in connection with the building of the two large batteries at Bishop's Marsh and Folly Point, are steadily progressing. The most formidable difficulties have been encountered at Folly Point, owing to the soft, spongy nature of the soil on which the battery will be placed, and much time has been lost in sinking the foundations, from the frequent slipping and sinking of the substructure, causing the most harassing delays in the prosecution of this portion of the works. The largest of the batteries for the protection of Chatham Dockyard will be that erected on Bishop's Marsh for the security of the passage of the headland of Darnet-ness. Here, again, the greatest difficulties have had to be contended against in consequence of the shifting nature of the soil on which the central foundations of this important line of fortifications are to rest. The diameter of the area required for the battery is about 400 yards, and the necessary excavations had been nearly completed for the reception of the concrete, when the heavy pressure of a spring tide, bearing on the sandy slope of the river face, burst through the wall and inundated the whole excavation. This accident has caused considerable delay in the progress of the work, but the greatest energy has been displayed by the contractors in surmounting the difficulty and repairing the mischief. The intention to erect a fort inside the Garrison-point, on the south side of the dockyard, has, it is understood, been abandoned, as that part of the Channel will be amply defended when the contemplated line of fortifications is completed. It is, however, intended to place a powerful casemated battery on Cheyne Rock, situate about three-quarters of a mile to the eastward of Sheerness dockyard. This fort will be connected with the present defences by a deep fosse capable of being filled whenever required. At each end of the ditch will be erected batteries heavily armed, so as to command the land approaches, as well as to assist in the sea defences. On the opposite shore of the estuary of the Medway the powerful batteries now being erected on the Isle of Grain are progressing. The martello tower, built a few years since on the Spit of Grain at a cost of several thousand pounds, will not be removed, as was originally contemplated when the plan of the proposed new fortifications was decided upon, its position being allowed to determine the relative situation of the other works.

BENSON'S WATCHES AND CLOCKS.—"Perfection of mechanism."—*Morning Post*. Gold watches 5 to 100 guineas; silver watches, 2 to 50 guineas. Benson's new Illustrated Pamphlet, free for two stamps, descriptive of every construction of watch, enables persons in any part of the world to select with the greatest certainty the watch best adapted to their use. Watches sent free and safe by post on receipt of a remittance.

J. W. BENSON, 33 and 34, Ludgate-hill, 46 and 47, Cornhill, London, E.C. Established 1749.

* To be continued.

THE ROYAL ENGINEERS.*

BUT little need is there, unfortunately, for "an Officer" to ask if the numerous commissions and committees, that within the last few years have been appointed to inquire into matters with which our Military Engineers are concerned, have been necessary or not? If the circulars, issued at various times by the Secretary of State for War, directing attention to incompetency, extravagance with public money, &c., have been called for or not? If all the pamphlets that have been printed teeming with charges of incompetency against engineer officers, are true or false? If all the letters, leading articles, &c., that have appeared in Professional and military papers and periodicals, the *BUILDING NEWS* among others, says the author, on the same subject, proceed from those who write merely for the sake of writing? or, if they, in common with commissions, committees, and pamphlets, tell us that there is something wrong in the organisation of the Corps of Royal Engineers, and that this cry will continue to be heard till a proper remedy is applied, and will not be quieted by mere temporary palliatives?

The Royal Engineers do not, they must themselves confess, occupy a very enviable position, subjected, as they have lately been, to attacks from all sides on their weakest point. There was the commission appointed to inquire into the state of our national defences, another on the sanitary condition of the army and the hospitals and barracks, another on the education of the officers of the corps; then Lord Herbert appointed a committee to examine into the method of conducting the works and buildings under the department. In no one of these inquiries, it must be said, have the results been in any way creditable to the Royal Engineers as a body, or the system under which they are appointed.

In architecture and in engineering, it is usually considered that from five to ten years of study must be passed through before the student is competent to practise, and Vitruvius has bequeathed to us a somewhat extended series of acquirements which few would succeed in making themselves masters of in that time; yet, according to the system under which the Engineers are appointed, they before they are twenty years of age undergo a course of training in permanent and field fortifications, including designing and building, the construction of gabions, fascines, &c., pontoon, barrel pier and other military bridges, mining, military sketching, road making, use of weapons of warfare, including the power and effects of artillery, as also the strength and manufacture of combustibles, photography, chemistry, electric telegraph, machinery, astronomy, foreign languages, architecture, civil engineering, land surveying!

It also appears, though it has not been so stated in evidence, "that some of the officers of military engineers have devoted considerable portions of their time to the study of international and commercial law, as well as to the management and control of military and civil prisons, gaols, &c., for we occasionally hear of their being very suddenly promoted from some military post to a consulship, and of the same officer being as suddenly removed from that to a civil professional duty. Then, again, we hear of military engineers being appointed governors of colonies, superintendents of prisons, inspectors-general of military prisons,

chairmen of board for management and control of convicts, and all this, with their pay and promotion in the corps simultaneously going on, although they themselves are away from it."

As the writer says, "this is a formidable list of acquirements to be possessed by a young man before he is twenty years of age; nevertheless, we have it stated by high authorities in the corps, that all engineer officers undergo a training in the several branches here enumerated, which must be before they leave Chatham, because, as is well known, the most pernicious of all systems of promotion is in force in the corps of Royal Engineers. When

once an officer obtains his commission, and leaves Chatham, his promotion follows by seniority, as a matter of course, regardless of merit or ability—there is no subsequent examination. The greatest dolt, who has been crammed at college, and crammed again at Chatham, so soon as he can sign himself Lieutenant Royal Engineers, is promoted at the same rate as one who may be, both by the force of natural genius, as well as by education, an able and accomplished man. That there are clever officers in the corps, and many of them, cannot, nor is it intended here to be denied, but they are supposed to know something of so many things, extraneous to their real profession, that they have not even a complete knowledge of that."

With such a system, the result is inevitable. The officers themselves are not to blame; when impossible tasks are set, failure necessarily follows. It is madness to expect a single individual to be capable of becoming proficient in a dozen professions, any one of which is sufficient for the full employment of an ordinary brain. Consequently, "no engineer officer ever attempts anything without the assistance of others," and we find a numerous body of surveyors, draftsmen, &c., employed preparing drawings and specifications for the forts now being constructed, as well as those under consideration for the defence of the country.

Then with regard to the actual execution of the works, "All barracks, &c., are built by private contract, and when erected are kept in repair by private workmen, and for the best of all reasons, because it is proved to be cheaper and better than by any other system. Diligent inquiries have been made to ascertain the correctness of this, and in every case it is found to be so, no single instance to the contrary being forthcoming. And, even abroad, where it might reasonably be supposed that the Sappers and Miners, though they did not build, would at least keep in repair, those who undertake such works are invariably assisted by native civilians—the word "assisted," as applied in this sense, being capable of a very different interpretation to that usually assigned to it."

As regards the value of their labour compared with civil labour, it is remarked that many are under the erroneous impression that a soldier, who gets one shilling per diem working pay, works at one-fourth the cost of a civilian at four shillings per diem; and they also imagine that all Sappers' labour is the same as that of surveyors, draftsmen, or mechanics, being unaware that nine-tenths of the corps are only fit to be called labourers, and that their labour should be valued only as such, whilst, as regards the remaining tenth, their labour is not worth that of ordinary mechanics, as a rule, the exceptions also being very rare.

With the view to improve the existing state of things, the writer suggests that one of three things is absolutely necessary, either to relieve the

DESIGN FOR A CHIMNEY-PIECE.

* The Corps of Royal Engineers: Could it not be Re-organised; so as to produce an Efficient Body of Military Engineers. By an Officer. STANFORD, Charing-cross.

CHAPEL OF NOTRE DAME, BOULOGNE.—MR. C. F. HANSOM, ARCHITECT.

military engineer officers from the civil professional appointments they now hold, for which they are not qualified, and which they never undertake without the assistance of civil professional officers, and to confine them to their military profession, educating them so as to qualify them for the special duties which they will have to perform; or to create a new corps or body altogether, offering appointments in it to both officers and men of the present one; those who are unwilling to receive such to be placed on half pay if officers, and the men, if entitled to it, to be pensioned. To create a body of officers to be called staff engineers, who will have to instruct the troops in military engineering, so that they may be qualified to act when called on in the field. The admissions as staff engineers to be by competition, open to the whole army; the examinations to be conducted, where possible, by general officers, who have retired from the Royal Engineers; or, to hand over to the Royal Artillery, whose education is almost identical with that of the Engineers, all the military part of the profession, and to set about educating the Engineer officers, so as to qualify them for the civil professional appointments which they now hold on sufferance, at the mercy of the civil officers under them. To increase the Royal Artillery to a very trifling extent, to meet the extra demand that will be made on them, and remove from the combative list of the army the existing corps of Royal Engineers, instituting instead a branch or body of military architects for professional duties, such as are now termed civil professional duties; the admission into this new branch to be by competitive examination before the Civil Service Commissioners, and open to the whole country. By this means the cost of educating the officers of the corps of Royal Engineers would be saved to the country (except so much of it as would be required to educate about one-fourth of the number for the Royal Artillery); and the existing civil professional officers could be granted retiring allowances, or have compensation given them. The rank and file of the present corps to be disposed of, as in the previous scheme, as soon as possible.

ANCIENT AND MODERN SUPPLIES OF WATER IN ROME.*

THE unit or gauge of water supply in ancient Rome was $\frac{1}{16}$ ths of a digit in diameter, or 0.91 inch, the digit being 0.73 inch; the depth of the centre of the orifice below the surface of the water was fixed at 15 digits (or $\frac{1}{16}$ th of a Roman foot), equal to 10.96 inches; it furnished, therefore, 0.1508 gallons per second, or 13,029 gallons per day. Rondelet computes the ancient gauge to be 59.1951 cubic metres daily, and the modern one now in use at Rome 40.4552 cubic metres; but in the following calculations they have been taken at 40 cubic metres for the new Roman gauge, and 60 metres for the ancient or *quinary* as termed by Frontinus, and by which the discharge of the aqueducts was measured.†

From direct measurements made by Frontinus we have the following quantities of water discharged by each:—

	Gallons.
Appian and Augustan.....	24,166,950
Ancient Anio.....	58,679,988
Marcian.....	61,936,140
Tepulan.....	5,876,670
Julian.....	15,926,436
Virgin.....	33,067,824
Alsietinan and Augustan.....	5,176,752
Claudian.....	60,840,642
New Anio.....	62,579,628

Total 327,574,836 or 24,805 *quinaries*

By the ancient registers we find that, out of the total supply of 24,805 *quinaries*, only 14,018 *quinaries* were distributed; but Frontinus has proved that there existed numerous frauds on the part of those in charge of the distribution, who turned the water for the benefit of house proprietors who had no right to its use, and on the part of many neighbouring farmers, who pierced the canals, and by these frauds defrauded the state of more than 10,000 *quinaries*.

In a notice upon the distribution, value, and legislation of the waters of ancient Rome,‡ M. Dureau de la Malle mentions that the nice aqueducts only supplied in all 6,333 *quinaries*, and deduces this result from the inferiority of the diameter of the quinary, and “la supposition (note 4, page 3) que le centre de l’orifice du quinaire était à la même profondeur au-dessous de l’eau que le centre de l’orifice du ponce de fontainier§ (soit à 7 lignes.)”

This is an error. Rondelet has found that the ancient Roman gauge was a calyx or cylinder of given diameter and length, and placed horizontally in the side walls of the water towers in such a manner that the centre of the orifice of the calyx was at a distance below the surface of the water equal to the length of the calyx.

The modula of the different concessions to individuals had all their centres on the same line of level. This arrangement yet exists at the present day.

The actual gauge of Rome at the present day is one inch, or one-half of a palm, 0.7355 English inches in diameter, and the centre of its orifice is placed at 15 inches, 11.04 English inches below the level of the water. The inch is equivalent to a digit, and the actual gauge differs only from the ancient in that its diameter is one digit instead of five-fourths of a digit; but the depth of the centre of the orifice has never changed.

In comparing the above quantities of water supplied with the population

of ancient Rome, we have no perfect data, except that we may imagine ourselves to be somewhat near the truth in taking the maximum at one million inhabitants at the end of the first century of our era, under Trajan. Letarouilly fixed the population under the Emperor Aurelian, 270 of our era, at 820,000, and he deduces this number, first, from the surface occupied within the boundaries of the town; second, the number of the habitations; third, the consumption of wheat. Admitting, then, a maximum of one million at the end of the Augustan age, the water supply would have given 330 gallons per inhabitant.

The registers of distribution show that 14,018 *quinaries* were thus distributed:—53,655,978 gallons distributed outside the town; 22,542,642 gallons in the name of Caesar (imperial gardens, theatres and palaces); 50,803,482 gallons were distributed to private persons, giving a revenue yearly of £2,700; 58,119,606 gallons for public service—viz., 3,684,474 gallons for nineteen camps, 31,707,606 gallons for public establishments, 5,097,516 gallons for theatres, 17,630,010 gallons for 510 pieces of ornamental water.

As to the mode of distribution, there were 247 water towers in the time of Frontinus, from which all the pipes derived water, their centres being all on the same horizontal line. A decree of the Senate forbade any concessionist or subscriber to take water from any points in the conduits but these towers, in order that the public fountains, which flowed day and night without intermission, might not suffer any damage.

We are told that the most glorious work of Trajan was not only that of furnishing a great abundance of water to Rome, thereby rendering the air more salubrious, but of having rendered this supply as pure and agreeable as possible, and diminishing the prevalence of intemperance. After slight showers of rain the Roman waters were turbid and muddy; but this was not a natural defect of all the aqueducts or supplies, for the Marcian and Claudian, and some others, derived immediately from springs, were of a perfect limpidity. When the spring waters and the Anio streams came to be mingled, they were polluted by the impurities of the latter.

The Emperor Trajan classified, therefore, the supplies of water according to their respective origins. The Marcian, of the purest quality, held the first rank, and was reserved exclusively for drinking purposes, and the others were appointed to various uses, each according to its quality. The Anio canals were destined for the irrigation of gardens and the cleansing operations (sordidiora) of the town.

Among the rules and prescriptions handed down to us by Frontinus, we may notice a decree which forbids “in the neighbourhood of springs, vaults, walls, canals, and subterranean conduits, any enclosed garden, trees, vines, hedges, bushes, boundary walls, willow plantations, or reeds, at a less distance from the watercourse, on either side, than 15 Roman feet (14½ English).”

It was also enjoined that the masons should carry on the works of repair from the month of April to November, but to suspend them during the greatest heat of summer, inasmuch as it was as dangerous for the masonry as severe frost. The care of the aqueducts belonged anciently to the censors and aediles. Afterwards officers were appointed called *curatores aquarum*, with 720 men, whereof 260 (Publica), and 460 (Familia Caesaris) were two separate bodies.

THE CITY SURVEYOR'S ANNUAL REPORT.

FROM Mr. Haywood's report of works executed by the Hon. the Commission of Sewers of the city of London during the past year, we learn that 1,596 feet of new sewers were constructed, 1,402 feet being on the lines of old sewers. The total number of premises drained was 144, thus increasing the number of houses drained to 13,184.

No conclusion as to the cause of the deaths of four men who were found dead in Fleet-lane sewer has been arrived at, a circumstance considered to be remarkable, inasmuch as there was an apparent absence of all those conditions which are usually found in connection with such accidents.

Improvements have been effected by widening King Edward-street at its southern end, the houses on the north side of Newgate-street, between King Edward-street and Bath-street have been set back to the improved line, other streets have been widened and negotiations are pending for effecting farther improvements.

The experiments made in June and July last with reference to carburetting the gas supplied to the public lamps as suggested by the United Kingdom Carburetting Gas Company, were deemed so satisfactory that it was determined so to frame the specification of the new contracts for the public lighting that the Commission might, if they thought fit, adopt the carburetting process.

The business transacted by the Commission under the Metropolitan Buildings Act may be gathered from the following summary of cases:—Number of structures reported upon by the surveyors appointed by the Commission, 92; number of cases heard before the magistrate, 12; number of buildings shored up during the year, 8; number of cases certified by the surveyors as being completed, 82. This is a great reduction in number as compared with the year 1860.

The number of drinking fountains now within the City are as follows:—One at the corner of St. Mary-le-Bow Church, presented by Messrs. Copestake and Company; one at the corner of St. Sepulchre's Churchyard, at the corner of Giltspur-street, S. Gurney, Esq., M.P.; one at Fleet-street, in front of the Church of St. Dunstan-in-the-West, Sir James Duke, Bart., M.P., Alderman, &c.; one at Adelaide-place, London-bridge, the United Kingdom Temperance and General Provident Institution; one in Bishopsgate-street-without, in front of the Church of St. Botolph, Bishopsgate, C. Gilpin, Esq., M.P.; one in Moor-lane, opposite the Police Station, Mrs. Smees; one in front of the Royal Exchange, S. Gurney, Esq., M.P.

From a return on house inspection and removal of nuisances, it appears that, during the year, 9,111 inspections of houses were made by the district inspectors under the direction of the Medical Officer of Health, and, consequent upon their reports, the following notices were issued:—For works of drainage, 13; for pre-

† 1 cubic metre = 220.1 Imperial gallons, i.e., the ancient quinary = 13,206 gallons, and the modern = 8,804 gallons.

‡ Comptes rendus des séances de l'Académie des Sciences, séance du 13 Février, 1843.

§ The ponce de fontainier of France corresponds to a Paris inch gauge (0.92707 metres). With this diameter, and a charge of 7 lines (0.9158 metres) on the centre of the orifice, the flow per second is 0.000,222,166 cubic metres.

venting the issue of waste water upon the surface of pavements, 54; for lime-whiting and cleansing the interior of premises, 1,052, total 1,119.

The number of slaughter-houses existing in the City is now 66, being the same at the end of 1859. The regulations for these are again under revision. The number of cow-houses is 18, being two less than at the end of 1859.

CHAPEL OF NOTRE DAME, BOULOGNE.

THE chapel, of which we give a view in our present number, has recently been erected on the outskirts of Boulogne, on the Paris road. It is intended to be similar in design to a chapel erected in the thirteenth century, which had become famous, not only throughout France, but also throughout Christendom, as a place of pilgrimage.

The last remnant of the original structure was swept away during the Revolution, and a mean, unsightly building was erected soon after, in the worst possible taste; this has now been entirely demolished, and the present building erected on the original foundations.

The new building, has been designed by an English architect (Mr. Charles F. Hansom, of Clifton), and, together with two other churches in the same town, has been executed under his superintendence.

The Chapel of Notre Dame is executed entirely in the beautiful white stone from St. Leu. It is very small, being only 27 feet long by 15 feet wide internally. Each bay is marked by a projecting wall shaft, with carved capitals, from which springs a groined roof of stone, enriched with moulded ribs and sculptured bosses. The altar and reredos are executed in Caen stone, and occupy the centre and two side bays of the apse. The floor is laid with Minton's encaustic tiles, of rich patterns, and all the windows are filled with stained glass.

Externally, the history of the original chapel is portrayed in a series of sculptured panels in the lower compartments of the window, and in the tympanum of the entrance doorway.

The carvings and sculptured decorations have been executed by Mr. W. Farmer, of London.

THE SCREEN AND RECTOR'S STALL, EXETER COLLEGE CHAPEL, OXFORD.

A view of the interior of the new chapel at Exeter College, Oxford, was given in the BUILDING NEWS some time since, and showed the general aspect of the design as viewed from the west end. Our illustration—page 127 *ante*—presented a portion of the detail work to a large scale, exhibiting the western screen, the upper part of the rector's stall, and the entrance gates. The crocketed gable and door seen behind belong to the principal entrance to the building, and the stone corbelling springing from the columns at the back supports the organ-gallery, which is ranged against the end wall. The screen in question separates the chapel proper from the ante-chapel, and is a highly elaborated piece of workmanship, the cost of which was defrayed, we understand, by the undergraduates of the college. There are in all eight arches, carried by coupled columns of marble, and in the centre is a bold doorway, singly cusped, and diapered on the soffit. The entrance gates below are of brass, the cresting along the top of the screen, is of the same material. The rector's stall is the first to the right on entering the chapel, and it is distinguished from the range of ordinary stalls by the canopy, which, with its supporting shafts, is of oak. Great variety of design is manifested in this screen, as well as elsewhere throughout the building, the foliage being founded chiefly on natural types. This portion of the work has been executed by Mr. J. B. Philip, of London, who also prepared the whole of the screen, excepting the metal gates and cresting, which were supplied by Messrs. Skidmore, of Coventry. The stalls and woodwork were supplied by Mr. J. R. Symm, of Oxford, who was the contractor for the works generally. Mr. G. G. Scott is the architect.

THE ARCHITECTURAL EXHIBITION.

ON the occasion of issuing the balance sheet for the year 1861, and before speaking of the business of the past year, it becomes the painful duty of the Committee to mention, with the deepest regret, the recent loss which the Society has suffered, and which stands recorded in their minute-book in the following terms:—"That the Committee of the Subscribers of the Architectural Exhibition desire to record, with sentiments of the deepest respect, their sense of the great loss which this Society has sustained by the lamented decease of his Royal Highness the Prince Consort, who for many years, as Patron of this Society, has given the direct and public sanction and support of his name to its objects, and this Society has thus a special and peculiar reason to deplore the loss mourned in common by all who are engaged in the advancement of art."

The Committee felt it to be their duty, and one which would meet with the approval of every supporter of the Exhibition, to make a donation of £10 10s. out of the funds of the Society towards the proposed memorial to his late Royal Highness.

By the statement of accounts, it appears that the Society still prospers, and that there is an increase of the balance in hand. Some additional expense has been incurred, in consequence of the Committee taking upon themselves to pay the cost of carriage of all drawings from the country, and back again; and they will continue to do this, and to give free tickets of admission to Exhibitors during the day, reserving only the evening meetings and lectures for subscribers and season ticket holders exclusively.

It is said that the thanks of the subscribers are due to A. J. B. Beresford-Hope, Robert Kerr, E. A. Freeman, R. P. Pullan, and G. E. Street, Esquires, and the Rev. J. L. Pettit, who lectured on the Tuesday evenings, and to G. G. Scott, Arthur Ashpitel, W. Burgess, E. B. Lamb, and J. W. Hugall, Esquires, who presided on these occasions.

The next Exhibition will open at the *Conversazione*, on Tuesday, the 25th of March, and on the following day to the public.

The Committee trust that on this occasion all those who have any suitable works to exemplify will exhibit, and that the Architectural Exhibition of 1862 will far exceed all that have preceded. They are glad to announce that the Exhibition will contain an entire collection of the original sketches and drawings of the late A. Welby Pugin, and which possess the highest interest for all lovers of architecture.

All drawings and models, we may remind our readers, must be delivered at the Galleries, Maddox-street entrance, on Monday, the 3rd of March.

DECISIONS IN THE COURTS.

INJURY TO MINES BY RAILWAY.

Bagnall and Another v. The London and North Western Railway Company.—*Court of Exchequer.*—A railway company, under the authority of an Act of Parliament, took for their line ground lying over mines, then not worked, belonging to the former owner of the surface. In order to gain the level of their line the company took away a stratum of clay, and left a surface of porous rock; they carried on the line, at a slight ascent, to a brook at some distance, over which they carried the line by a flat bridge, not constructed so as to contain the waters in times of flood. Between this brook and the surface of the mine there was originally a rising ground, through which the company made a cutting for the level of their line. Afterwards the owner of the mines began to work them, and the line began to sink; the company kept up the level of the line by heaping ashes and such substances thereon, and on the drains by the side of the line, which had also sunk. The company were bound to keep up these drains, but, after they had sunk, did not. A flood came, and the waters of the brook, where it is crossed by the bridge, overflowing the girders, were carried down along the hollow of the line and of the drains to the spot overlying the mines, and, sinking through the porous rock, deluged the mines and stopped the works;—Held, that the owner of the mines had a right of action against the company for the injuries arising from both the overflow from the brook, and the fall of rain-water on the spot, and the overflows of the springs laid open in the cutting, and that his remedy did not lie in compensation under the Act of Parliament.

In giving judgment Baron Bramwell said, the material facts in this case are as follows:—The plaintiffs are owners and occupiers of coal mines. The surface soil, as well as the coal below, formerly belonged to the same owner; but a railway company, to whose rights and obligations the defendants have succeeded, took the surface, under the powers of a private Act of Parliament, for their railway, and constructed it thereon. The railway company—by which may be understood indifferently the original company or the defendants—cut and removed upwards of 20 feet in thickness of the surface soil over where the plaintiffs' mines now are, to get the level at which they laid their rails. This surface soil was clay, impervious to water; they removing it, a porous rock was reached. The soil was in like manner cut away by the railway company along the length of the line to a lower district of country, through which a brook flowed. There the railway was made on or above the natural level of the ground. It was carried over the brook by a flat bridge. The line of railway sloped downwards from the bridge to the part over the plaintiffs' mines. The bridge was sufficient to let the ordinary water of the brook pass, and even more, but was an impediment to the passage of water in large floods. The railway company was bound to make and maintain drains, the obligation being substantially the same as in the Lands Clauses Consolidation Act. A flood happened in 1860, and the result of the combined acts of the company was, that water, part of which would have escaped but for the bridge, flowed down the railway, and, the high ground between the brook and the surface over the mines being removed, it reached that spot, and the high ground and protection of clay then being gone, and the drains being imperfect, as after mentioned, it permeated into the mines. So also did the water falling on the spot itself, and the springs arising in the cutting. But it here becomes necessary to mention, that when the railway was making, the mines were not worked under nor within forty yards of the railway. The railway was made with drains at the side sufficient to carry off the water which came or fell there, without doing any mischief, as matters then stood. When the plaintiffs' workings came to forty yards from the railway, they gave the defendants notice under the local act, which may be treated as substantially the same in its provisions as the Railway Clauses Consolidation Act. The defendants, however, did not purchase the mines. The plaintiffs accordingly worked on, and when their workings came under the railway, from no fault or negligence of theirs, but as a natural consequence of fair and lawful working, the railway sunk, and continued to do so from time to time. The defendants repaired this by throwing materials of a porous nature on the sunk parts; they did not, however, repair and puddle the drains, which, from the sinking of the soil, became insufficient; and even had they been sufficient, they would not have carried off the flood-water of August, 1860. For the damage sustained from the water thus getting into the mines this action was brought. It seems to us impossible to state these facts without shewing that the plaintiffs had a claim on the defendants of some kind. Without any fault of theirs, the natural condition of things had been altered. The water of a brook, which flowed at a distance of one-third of a mile from their mine, inaccessibly to it, by being separated from it by a ground 25 feet high, has been diverted over it, its natural covering and upper soil being removed from it. From the last-mentioned circumstance, and the want of sufficient drains, the rain which fell on it, and the springs which arise in the cutting, have got into it. These are the acts of the railway company alone. It is said that the plaintiffs have brought about the mischief by working their mines; but they had a right to work them as they did; they lose no right by doing so. It could not be contended that had the defendants thought fit to agree to purchase they could have done so at a nominal price, on the plea that if the plaintiffs worked them they would be worthless, as they would be drowned: We do not say that the defendants were bound to restore the surfaces they might have diverted their line, and left hollows over the spot in question, but they were bound by their Act to make and maintain effectual drains. This reasoning applies to water other than that from the flood. As to that, the plaintiffs' case is still clearer. Suppose, instead of the defendants' railway passing through the cutting, and over the brook, it had been a through railway, belonging to a private proprietor, joining the defendants' railway just before reaching the plaintiffs' mines, would not such private proprietor have been clearly liable to this action? And, if so, why are not the defendants? As to the flood-water, they are not sued merely as the railway company who have taken the surface of the plaintiffs' land, but as persons who, by their acts on lands at a distance, have done this injury; and it seems to us they would be liable for damage by flood-water if the plaintiffs had continued owners of the surface, and, for some reason, had thought fit to remove it to the depth the railway company has, for they would still be the acts of the defendants which sent the water there. But it was suggested that if the plaintiffs had a claim, it was to be enforced under the compensation clauses. We think not. The plaintiffs are not injuriously affected by the works of the railway company. Supposing the company had possessed no statutory powers, they could not have been restrained by injunction from executing any of these works, nor could any action have been maintained against them simply for their construction. The railway company would have been entitled to say, "these are not injuries, and never will be. By means of puddling the surface, and drainage, no water will ever reach you;" nor need it, as appears. It is not, therefore, the works intrinsically which injuriously affect the plaintiffs, but the defendants' wrongful conduct in relation to them in not making and maintaining outlets for the flood-water, or damming it off the plaintiffs' land, or covering the surface thereof with clay, and in not maintaining those drains which were sufficient to carry off the rain which fell, and the spring water which arose there. Our judgment is for the plaintiffs in respect of both these claims.

THE MASTERPIECES OF CHURCH ARCHITECTURE.—Dr. Carl von Lützow is preparing a work on Ecclesiastical Architecture (*Die Meisterwerke der Kirenenbaukunst*). Taking the chief buildings, the author gives the history of their erection so far as it may be known, and then describes their present state. The work is to be illustrated; the first part has appeared.

RELICS OF EASTERN ARCHITECTURE.*

INSTEAD of following the usual route pursued by Eastern travellers—crossing the desert from Egypt to Palestine, and proceeding thence to Syria—Miss Beaufort and her sister sailed furtively from Alexandria to escape from the procrastination and injustice of an Egyptian court of law. After visiting Smyrna—where Mr. Hyde Clarke and the Ottoman Railway Company are teaching Arabs the advantages of railways, and are rapidly inoculating them with a taste for swift, easy locomotion—the authoress took land at Beyrout. They, however, previously visited Mitylene, and, while the steamer called at the ports, Rhodes, Latakia, and Tripoli. Coasting along they caught sight of Budrun, where their father, the late Sir Francis Beaufort, may be said to have commenced his life-long labours in the service of science. The feminine modesty of Miss Beaufort has prevented her from doing more than make a passing allusion to the explorations of the late hydrographer to the navy; but we, who have no such motives for silence, ask the indulgence of the reader for a brief digression, which the publication of Mr. Newton's researches at Budrun will invest just now with interest.

Karamania comprised the ancient provinces of Lycia, Pamphylia, and the two Cilicias, with parts of Caria and Phrygia. Mount Taurus, which cut the inhabitants off from communication by land with the central government, and the remoteness of the shore from the ordinary sailing track, combined to render this portion of the Mediterranean seaboard almost unknown, though it had been the site of Greek colonies famous through all time, the scene of the heroic deeds of Cyrus and Alexander, and the birthplace of the Apostle to the Gentiles. "This serious chasm in geography determined the Lords Commissioners of the Admiralty to employ a frigate on the survey of the coast, and H.M.S. *Frederiksteen*, of 32 guns, being then stationed in the Archipelago, was selected for that purpose." Nearly fifty-one years ago Captain Beaufort sailed from Smyrna on his voyage of rediscovery. We pass over the places he visited and the remains he brought to light, to Budrun—a corruption of S. Pietro probably, as the Arabs pronounce *p* as *b*, and confound *d* with *t*—to encourage, by the example of Mr. Newton's success, after Captain Beaufort's failure, the spirit of research. A curious incident arising out of the war induced the Captain of the *Frederiksteen* to visit the locality at first. News had reached Malta of unusual facilities having been afforded to a French privateer in the disposal of her prizes, so the *Frederiksteen* was ordered to look in at the port, and her captain to make a note of what he saw. All that he could discover of Halicarnassus is described in a paragraph:—"The walls of the ancient city may be here and there discerned, and several fragments of columns, mutilated sculpture, and broken inscriptions are scattered in different parts of the bazaar and streets. Above the town are the remains of a theatre, which measures about 280 feet in diameter, and which seems to have had about thirty-six rows of seats." With our knowledge of Mr. Newton's discoveries, how strangely do the disappointments and speculations of Captain Beaufort read!—"We searched with eagerness, during our short stay, for some traces of the celebrated Mausoleum; but our toil was entirely fruitless. Yet, if it stood on the higher ground behind the present town, or even if its site be now covered with modern houses, still it is scarcely credible that the remains of a building of such peculiar shape and of such sumptuous execution should have been so completely removed or destroyed as to leave no vestiges by which even its position may be recognised." From these premises Captain Beaufort was inclined to imagine that the present fortress occupies the site of the Mausoleum—"A bold, elevated rock, conspicuous from the sea, the shores of the bay, and from all parts of the city, would seem to have been a spot eminently suited to the ostentatious grief of Artemisia." What added weight to this hypothesis were the observations made of numerous pieces inserted in the walls of the castle, representing processions and combats between draped and nude figures, and the report of a Greek, who declared to have seen in the interior a long frieze, with highly wrought figures, besides many other pieces of sculpture and inscriptions. So Captain Beaufort concluded that when the Knights of Rhodes hastily built (1402) the castle upon the ruins of a fortress they had just surprised, they paid little attention to the "preservation of pagan relics," and, in fact, quarried the stones for their structure from the remains of the Mausoleum. Mr. Newton has, within the last few years, set the matter at rest.

At Rhodes the authoress found the church of the knightly order in ruins, from the explosion (1856) by lightning of powder which had been concealed and forgotten in the vaults beneath. At the siege by the Turks, upwards of three centuries ago, the fortress was compelled to surrender for lack of this very powder. Of the eight fine auberges which belonged to the languages of the Order but five remain distinguishable—that of England, exhibiting the date 1483, and the shield and arms of Peter d'Aubusson, Grand Master, who won for the fortress the proud title of "Buckler of Christianity," at the first siege; that of Italy, bearing the date 1519, and the arms of Fabrice de Carretto, last Grand Master before the second siege; that of Spain and Portugal, showing the scutcheons of the two nations united, of the Order of Amboise, and of the two Commanders; that of Toulouse, with the arms of France, the of Order, of Cavetto, and of Com. Flota, with the sub-inscription, "P. S. Dns. F. Franciscus Flota Prior Tholose construxit anno 1518;" and that of France, the best preserved of all, for it has been cared for in modern times, and the doorway, with its elegant mouldings of the usual twisted cable, after the Saracenic type,

small columns, and similar mouldings between the floors, is one of the chief architectural features. Over the doorway are the inscription, "De France le gnt prior F. Emery de Amboise, 1492," the cross of the Order, and the pales of Amboise; and two scutcheons leaning on lions rampant, with the canting arms, three nails, of Pierre Clouet, the architect, on each. (Where is the mark of the architect of the English auberge?) Then come two tablets exhibiting the arms of the Order and Amboise, with the motto, "De Amboise em gnt prior;" tablets with the arms of Villiers de l'Isle Adam, and scutcheon with the royal arms of France and the motto, "Voluntas Dei," and the date 1495, St. Louis at the side, and "Dieu (ayde) le Pelerin" above; a second scutcheon of Amboise, and the cardinal's hat presented to P. d'Aubusson, his shield, and that of the Order. A little beyond is the Chapelle de France. Seeing the care with which France preserves the memory of her past achievements, as in Rhodes and in Tunis—where she has restored the chapel of St. Louis—it is not surprising that her influence should be so great over Eastern minds. It must be a source of regret that neither the English Government nor the present representatives of English families that derive their illustration from the valour and piety of the Knights should have cared to preserve the auberge of England from decay and profanation as a monument to the chivalry of our race. A trifling subscription would buy the structure and freehold and install a guardian or a school. We do not despair of this being done, if Mr. Scott can succeed in awakening public interest and consideration for architectural monuments, especially since Rhodes is likely to grow into importance from the British Museum having commissioned M. Salzmänn to uncover and collect antiquities from a Phœnician-Greek necropolis discovered near the village of Kalvarados, and believed to be that of Caroiros. He has already recovered sarcophagi, vases of all sizes, from three feet diameter down to a few inches, of every conceivable form, and ornamented with innumerable designs; figures to surmount long bottles of alabaster and stone; small porcelain idols, scarabei, buttons, and pieces of lead, exhibiting Phœnician characters; gold band and bracelet, an olive crown, with the leaves gilt bronze, and the fruit in porcelain (*query*, enamel?); lamps, rings, and beads, and gold oblong plates, so repeatedly found in the tombs, that M. Salzmänn supposes them to have been hieratic ornaments. The plates are each two inches long, always exhibiting the figure of Astarte. They are, perhaps, now in the cellars of the British Museum, and may be revealed to the gaze of the curious in the course of the next century, provided the increase of accommodation in Great Russell-street keeps the same rate of progress as it has done hitherto.

From Latakia there was little to report architecturally. There are ruined columns, friezes, and a triumphal arch, overgrown with weeds. We may add, *en parenthese*, that in the neighbourhood there is capital snipe shooting, and that the tobacco so prized in Europe is cured with the smoke from thorn fires, and is on that account—from its impregnation with pyroligneous acid—detestable to Oriental travellers who have enjoyed the Macedonian weed, or even the commoner tobacco of Southern Syria, such as is used throughout the Lebanon and in Damascus.

Tripoli is dismissed in a paragraph, for the short time allowed by the stoppage of the steamer would not allow of critical explorations, and yet it is, perhaps, the loveliest spot in Syria;—to the admirer of nature the most beautiful, and at the same time, perhaps, the most unhealthy to a European. The sources of natural beauty round about Tripoli are the causes of ague and low fever. Our talented Vice-Consul there, Mr. Mercier—who, by-the-by, is unpaid, even to the postage of his dispatches, has never been free from ague during the whole period of his residence. Tripoli was ever a favourite with the Crusaders, and they did their utmost to embellish it. Here Raymond of Toulouse built a castle on the banks of the Kadisha, which is fed by a thousand streams from Lebanon, to protect pilgrims, for it is the nearest port to the Cedars. From the Lebanon, which here attains its greatest altitude, two spurs shoot down to the coast, maintaining nearly parallel directions, and sink into the soil just above the town—one affording the site for the castle. The spurs are clothed with stately olive trees, interspersed here and there with fruit and flowering shrubs. The valley, down the centre of which flows the river, is a series of gardens planted with orange, lemon, fig, and apricot trees, pomegranates, clematis, sugar-cane, and creepers of many-coloured flowers. At the end of a long summer the whole of the valley is green, picked out here and there with the more vivid colours of ripe fruits. Right across the valley, and bestriding the river, is an aqueduct, built by the Crusaders, which conveys a pure cold stream from Lebanon to the innumerable fountains of the city. The Crusaders' Bridge, as it is still called, is so overgrown with perfume-giving plants that its construction cannot be easily discerned. The streets of Tripoli will bear favourable comparison with those of any Eastern city. They are narrow, it is true, but they are not so encumbered with filth as those of Beyrout. The houses have a European aspect, especially in the dressing of the stones. Nearly every one has an ever-flowing fountain, and almost all the streets are similarly provided. Here and there you are met in out-of-the-way corners with a stone cistern curiously carved. You hear the pleasant sound of falling water, and will see a little crystal stream, escaping from some fault, and running silently into a nook, where it disappears from sight. In this respect Tripolitans are better off than Londoners. They have a constant supply of pure water; we an intermittent supply of foul water contaminated by sewage.

To Beyrout the journey is not long. There are three routes: by sea, by following the coast, and by going through the Kesrawan. The first no architectural traveller would take. If he follow the coast he will visit Bshreh, which strikes the eye by its combination of rich culture, fantastic rocks, and flowery dells. The Kadisha foams and sparkles, and

* "Egyptian Sepulchres and Syrian Shrines." By EMILY A. BEAUFORT. Longmans, London.—Continued from page 123.

speeds away to the coast between rocks that rise vertically to upwards of 1,000 feet. At Jebel—the Gebel of the Bible—he will see the walls of a feudal citadel, with quaint machicolations seated on Phœnician masonry, and the surrounding country literally strewn with granite columns; he may, perhaps, gather information respecting Phœnician art from the recent researches of M. Rénan. After fording the Dog river, he will climb the face of a rock, where above him are the sculptured tablets of Assyrian conquerors—at all events, of the nine that have been recovered six are imputed to the Assyrians and three to the Egyptians. The carvings on the last are scarcely discernible, and then only under certain conditions of light, while most of the figures on the Assyrian tablets are distinctly visible. Lepsius says the Egyptian tablets all exhibit the cartouches of Rameses II.—that Sesostris, who, according to Herodotus, left *stela* and figures as monuments of his conquests in Palestine and Syria thirteen centuries before Christ, and which the historian reported having seen. Mr. Layard considers the Assyrian tablets to be the work of Sennacherib, the founder of the palace of Kouyunjik, and whose army was destroyed in Philistia, when the Angel of the Lord “smote in the camp of the Assyrians an hundred four score and five thousand,” but Dr. Robinson believes the tablets are the records of the five Assyrian monarchs who successively invaded Syria, or passed through it on the way to Egypt. It is one of these tablets—one of the links in the remotest history of man—which the French army defaced. If the tourist takes the other route he will come upon the fountain of Adonis, and upon the ruins of the temple of Venus, where was practised that strange and impure worship which led to Constantine’s destroying the structure as a nest of wickedness, but which, nevertheless, survives on the banks of the Ganges, and could be traced 150 years ago in the names and traditional ceremonies of the inhabitants of Provence.

The extent to which our notice has extended compels us to defer to a more favourable opportunity accompanying the authoress to the towns and cities of Lebanon, Syria, and the Holy Land, and to an investigation of her statements with respect to Jerusalem. Meanwhile we tender her our hearty thanks for her interesting account, thus far, of Egyptian sepulchres and Syrian shrines.

NORTH LONDON SCHOOL OF ART.

A PUBLIC MEETING was held in the Memorial Hall, Church-street, Islington, on Wednesday evening, to inaugurate a proposal to erect a building for the North London Gallery, Museum and School of Art. Earl Granville presided.

The school was established in May, 1853, with a view to supply a want which was then generally felt in the locality for an elementary school of drawing. After some preliminaries, the original committee sought an alliance with the Government project, then coming into operation, and consequently the school became a district school in connection with the Department of Science and Art. By this means the school secured the co-operation of the department, and obtained for the classes a supply of models and examples, together with the services of trained masters. It appears that notwithstanding the obscure locality of the present school-house in William-street, Clerkenwell, its difficulty of access, and want of proper arrangement and convenience, the students have steadily increased in number, from year to year, till at length they have fairly outgrown the present building. The evening classes now comprise 105 male and female students. It has therefore become very desirable that the school should have a home of its own in a more suitable locality.

Earl Granville in addressing the meeting, said, I have felt strongly that some reproach, not without foundation, attaches to us on account of the comparatively little encouragement which we in this metropolis have afforded to the progress of art. Whether it be owing to the peculiar character of our municipal institutions, or to the fact that a large portion of the richer inhabitants of our metropolis reside in it only during some months in the year, and consider their homes to be more in the country than in London, or that those persons who are constantly resident are more like the population of a nation than of a single city, certain it is there is not to be seen here that amount of active civic patriotism which is to be found developed in our large provincial towns. It is, therefore, highly satisfactory to me to see such an assembly as this met for so noble an object, and to be a sharer in that which, so far as this district is concerned, may be regarded as a great metropolitan work. There is another feeling, which I cannot doubt is shared by many present, which makes me very anxious to contribute my mite to any work which is to promote the progress of art among the masses of this country. I allude to that sad calamity which overwhelmed the nation at the close of the last year, when we lost one who by his character, his great ability, and high rank was placed in a position where his influence was exerted with advantage to the promotion of good taste in the productive industry of the country. I need only mention to you the name of the late illustrious Prince Consort to evoke from you a ready assent to the assertion that he devoted the eminent qualities with which he was endowed to the benefit of the country. It is not for me, on this occasion, to pass any eulogium upon his late Royal Highness, or to allude to those prominent virtues or those statesmanlike qualities which made him a help and a support to the Sovereign, so as to make the institutions of the nation strike deeper into the heart of the country. I will not now say what he did for science, but this is, I consider, a fitting occasion to speak of what he did for the promotion of art and the diffusion of good taste among all classes of her Majesty’s subjects. That illustrious and widowed lady has associated with her her subjects in affliction, and has declared that it is her desire to promote to the utmost of her power those objects which her husband had so much at heart when alive. There is, therefore, no one person in this room, or in the nation, who does not feel that in his own sphere, and within the limits of his own capacity, it is his duty to co-operate with his Sovereign in this national and most patriotic work. I have another feeling of satisfaction in attending this meeting, which is this, that the department with which I am officially connected, will probably, if you carry out your scheme, become associated with you in this good work. I am not going to give a history of what it has already done, but I cannot help speaking with some satisfaction of the great progress which has been made

by the permanent establishment of schools of design under the encouragement of Government in the diffusion of art and art education, I was this afternoon looking over some reports connected with those institutions, and I was much struck at the contrast which some of the figures and statements connected with them ten years ago make as compared with those of the present day. In 1851 the expense was not so very great, but then all Parliamentary grants were abolished, except in the case of those institutions which were shown to be directly profitable; but then the amount of voluntary subscriptions increased, and now we no longer look to them as the ground of action, except to assist in the building of schools. The noble earl having shown how the number of schools had increased from twenty to eighty-six, and the number of pupils from 2,600 to from 17,000 to 18,000, while the cost of education per head had fallen from £3 2s. to 8s. 4d. per head, proceeded to say: If you ask me what has been the practical result of all this, I will not myself answer the question, but will refer you to those cities and large towns where art and a knowledge of beauty and of design enters into the production of the local manufactures, sure that there is not one of them that will not state that the people have derived great advantages from the establishment of such schools among them. This is the realisation of the Prince Consort’s idea in promoting the Great Exhibition of 1851. I recollect that at the preliminary meeting some of the most eminent statesmen of the day, in speaking of what might be the probable results of that movement, said that in those works which required excellence, and the actual application of science to machinery, and in the production of the useful, we would be sure to excel the foreigner, but where imagination was brought into play, where artistic taste and design were applied to the beautiful and ornamental, we should be prepared to find ourselves excelled by the Continental manufacturers. I would be sorry to make a prophecy now, but hoping and believing as I do, that the coming Exhibition will be a great success and prove the complement of the work originated in 1851, I expect to see not the contrary results but results of a slightly different character. It will I think be found that while we maintain our pre-eminence in the production of practical and useful objects, we will feel some surprise at the strides which foreign nations have made in the same objects, and foreigners on the other hand will be surprised at the gigantic strides that we, when put upon our metal, have made in the application of artistic science and taste to not only the more costly, but also to the more universally used articles. For this some credit is due to the Schools of Art. One of the great peculiarities connected with art is, that whether we look to ancient or to modern times, to this country or to the other nations of Europe, at the most a choice few obtained employment in producing works of art for the enjoyment of a select circle of persons; whereas there is now a great change taking place, and many are employed in providing artistic enjoyment for the great masses of the people. The advantages of such a change cannot fail to be appreciated by such a meeting as the present; but if you are to produce the greatest possible effect by art instruction, then you must educate not only the artisan, the producer, the designer, and the workman, but also the great masses of the people who are to enjoy their works must have that amount of training and education which will enable them to derive that enjoyment from the contemplation of such works. Nothing has such an effect on character as a knowledge of excellence. Nothing so much contributes to ambition of the right sort, and to the modesty of the individual, as when he knows what can be done by others better informed and better qualified than himself. These are the objects here in view, and I cannot overstate the advantages to be derived from them in regard to the staple manufacture and trades of the district of Finsbury, especially watch and clock making, and jewellery and cabinet making. The noble earl concluded by wishing success to the efforts now being made by the committee for the establishment of the North London Gallery, Museum and School of Art, and expressing the gratification it would give him to find them in a position to apply to Government for its support.

Several gentlemen addressed the meeting, and the following resolutions were unanimously carried:—

That the knowledge of drawing and the arts of design are of essential importance to the arts and manufactures of this country, and to enable them to hold their proper position in competition with those of other nations.

That it is desirable that a building (free of rent, in the borough of Finsbury) be erected, for the purpose of establishing on a permanent basis the North London Gallery, Museum, and School of Art.

And that a subscription be opened for the purpose of raising the necessary funds for the building, and enabling the committee to obtain the benefit of the usual Parliamentary vote for building schools of art.

AWARD OF PRIZES BY THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the Special General Meeting of members only of this body, held on Monday last, Professor T. L. DONALDSON, V.P., in the chair, the printed notice convening the meeting, which was assembled to consider a report from the Council as to the award of prizes, was read from the chair.

The Royal Gold Medal.—In conformity with the recommendation of the Council, taken into consideration by the meeting, it was unanimously resolved:—That it be humbly submitted for her Majesty’s gracious consideration, that the Royal Gold Medal for the year 1861 be awarded to the Rev. R. Willis, M.A., F.R.S., honorary member.

The report of the Council relative to the essay and drawings received in competition for the medals and prizes of the Institute, and the designs for the Soane Medallion, having been read, the adjudication of the prizes was confirmed, as follows:—

To the author of the Illustrations and Description of the Church of St. Peter and St. Paul, Breckhurn Priory, Northumberland, the silver medal of the Institute, with the sum of five guineas.

To the author of the design marked M, for a Museum of Sculpture and Painting, a prize in books of the value of five guineas.

To the author of the design with the motto “Hope on, Hope Ever,” for a small Market-house and room above, the President (Mr. Cockerell’s) prize.

To the author of the design with the motto “Mente et Manu,” for a Villa, an Institute prize in books.

“Quid Nunc,” Chapel, and “Humber,” Villa, both commended.

To the author of the designs with the motto “Con Amore,” Mr. Tite’s prize.

To the author of the design with the motto “ελεος,” for a Dispensary, the Student’s prize in books.

"Z." and "M. R." commended for their designs for a Dispensary.

To Mr. S. Fry, student, for the best series of Monthly Sketches, a prize in books.

We are at present unable to give the names of the successful competitors who sent in designs under mottoes, because, owing to some mistake, the envelopes containing them were not opened at the meeting on Monday evening. We understood, however, that there is no doubt the recommendation of the Council as to the great prize—the Royal Gold Medal—will be confirmed by the Queen.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.

THE first *conversazione* for the season of the Society for the Encouragement of the Fine Arts took place at the rooms of the Winter Exhibition, 120, Pall-mall, on Wednesday evening, and was attended by a very numerous assemblage of ladies and gentlemen. On this occasion the prize medals awarded last session were presented. In the course of the evening the chair was taken by Mr. DUTTON, who said he appeared before the meeting under disadvantageous circumstances, inasmuch as Mr. Tite was to have taken the chair, but Parliamentary and other avocations prevented him from doing so. As to the position in which they were at present placed, he might say that it had been the main object of the Society to take care of the rising genius of the day, and, therefore, in passing by all those artists who in their respective branches had so very much distinguished themselves, they must not consider it in any sort of way a demerit that the Society had not deemed it right to award them medals, as it was considered more within its province to look to rising genius than to artists who had already risen and established themselves, and who of course were so well known that they could not in any degree find fault with the present proceedings. It was always agreeable to offer the meed of praise to rising merit.

Mr. HENRY OTTLEY, hon. secretary, then read a short report from the Council of the Society, which stated that the prizes, silver medals, had been awarded as follows:—

HISTORICAL PAINTING.—Mr. Marcus Stone, "Clandio and Hero," in the Royal Academy.

LANDSCAPE.—Mr. McCallum, "Spring—Burnham Wood," Royal Academy.

GENRE.—Mr. Calderon, "La Demande en Mariage," Royal Academy.

WARREN COLOURS (Two Prizes).—Mr. S. Read, "Interior of St. Augustin's, at Antwerp," Old Water Colour Society.—Mr. E. H. Warren, "Rest in the Cool and Shady Wood," New Water Colour Society.

SCULPTURE.—Mr. G. Halse, "The Tarpeian Rock," Sculpture in bronze. Royal Academy.

ARCHITECTURE.—Mr. A. W. Blomfield, M.A., (President of the Architectural Association.) Design for "Mission House," erected in Bedfordbury, Westminster, in the Architectural Exhibition.

There had been no award made for poetry or engraving, and the award for music was postponed, but the Council hoped in the course of the present session to make an award in that department of the fine arts.

Medals had been awarded for valuable services rendered to the Society to Miss Parepn, Herr Formes, Signor Gardoni, M. Ole Bull, and Mr. Santley. A medal was also awarded to Mr. S. Rosenthal for making a design for the Society's medal and other valuable services rendered to the Society.

The prizemen present were then called up and received the medals from the Chairman amidst the applause of the meeting.

The musical arrangements of the evening were exceedingly effective, and embraced the following programme:—

Part I.—Duet, "The Sailor Sighs" (Balle), Miss Emma Boden and Mr. Edward Southwell; Aria, "Stride la Vampa" (Verdi), Miss Bellingham; Old English Song, Mr. Lawler; Cavatina, "Ernani Invelema" (Verdi), Madame Furst; Solo (Pianoforte), "Les Arpeges" (Hailah), Madame de Vaucheran; Song, "Thou art so near" (Reichardt), Herr Reichardt; German Lied, "The Maid of the Ganges" (Mendelssohn), Mr. E. Southwell; Aria, "In questa tomba oscura" (Beethoven), Miss Emma Boden.

Part II.—Solo (Violin) (Ole Bull), M. Ole Bull; Song, "The Green Trees" (Balle), Miss Bellingham; Song (Herr Reichardt), Reichardt; Solo (Pianoforte) (Ganz), Herr Wilhelm Ganz; Ballad, "Cease your Funning," Madame Furst; Sacred Song, Mr. Lawler; Song (Wallace), Miss Emma Boden; Duet, "So 'am'i ancor" (Verdi), Madame and Mr. Edward Southwell.—Conductor, Mr. Alfred Gilbert.

Refreshments were supplied in the upper gallery of the Exhibition, and the proceedings of the evening were conducted with marked success.

SOCIETY OF ARTS.

AT the meeting of this Society on Wednesday night, the Duke of Wellington, K.G., in the chair, the paper read was "On the Art of Constructing Turkish Baths, and their economy as a means of cleanliness," by Mr. David Urquhart. The author began by drawing attention to the great antiquity of baths of this character. Their use appears to have prevailed in these islands 2,000 years ago, and he therefore urged that he was merely advocating the restoration of a habit which in ancient times and in other countries had been found so beneficial. He avowed, however, that while an attempt was being made to introduce it in the west, it was exposed to extinction in the east, for the younger Turks, many of them, neglected its use. He explained that most of the so-called Turkish baths at present established here hardly deserved the name, and he then proceeded to describe, in very considerable detail, the various processes to which the bathers in Turkey and elsewhere were subjected, explaining also the bath as used by the ancient Romans, so far as this could be ascertained by the allusions to it in classical writings, and by the various architectural and other remains that have come down to us. He urged that it was a mistake to suppose that this was an expensive luxury, and pointed out that, according to a proper calculation of the cost of fuel and other necessities, these baths might be supplied to the poor as well as the rich at a very small cost. He appeared to be of opinion that the difference between the bath as used by the ancient Romans and the modern Turks was very slight—the latter, however, having introduced some details tending to greater decency and propriety. Speaking of the advantages of perfect cleanliness among all classes, the author pointed out that our intercourse with the lower orders was broken off by there being no settled occasions on which we are in contact with them, and by the want of cleanliness in their persons. In the bath, both classes were constantly brought into the presence of each other. Contempt and distaste were removed on one side, degradation and irritation on the other. He combated the impression that the bath is weakening, pointing out that those who are in the habit of taking it are strong and live to a great age. He related its marvellous effects upon himself when worn out by excessive fatigue; and concluded by pointing out its value as a remedial agent in the cure of many of the diseases to which the human frame is liable.

CHESTER ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

AT the fifth monthly meeting of this society the Rev. Canon BLOMFIELD delivered a lecture, "On the Laws and Customs of England in the Sixteenth Century, as they affected Trade, Commerce, and the Social Life of the Times," taking as his basis the revelations of an old black letter statute book of the reign of Elizabeth.

Some relics of Samian and other pottery found at the rear of God's Providence House, in Watergate-street, were exhibited by the architect, Mr. Harrison.

CHURCH, CHAPEL, AND SCHOOL BUILDING.

CHURCHES.

Leicester.—St. Andrew's Church.—This new church was opened on the 20th ult. It is erected from designs by Mr. G. G. Scott, and has been built by Messrs. Osborn Brothers, of Leicester. The ground plan of the building is cruciform, and consists of nave, transepts, and chancel with semicircular apse. It is built in the Early English style, almost entirely of brick, slightly relieved with Bath stone, which is introduced in the arches, the window sills, the weatherings of buttresses, the arcade round the exterior of the apse, and in various other parts of the building. The exterior is principally of red brick, ornamented with blue. The gables are coped with brick, with stone springers. The roofs are covered with Swithland slates, in diminishing courses. The two principal entrances are through a door at the west end and a porch on the south side; and there is also an entrance for children in the north transept. The view presented on entering the church at the west door is good, the rich soft colour of the bricks with which the walls are faced, and the lofty arches which divide the nave from the chancel and transepts, together with the complicated timbers of the roof, adding much to the general effect. Owing to the absence of pillars, the altar and pulpit can be seen from every part of the building. The nave is covered with an open-timbered roof of one span, the ridge of which is about 60 feet above the level of the floor. The principals, which are seven in number, form double arches across the nave, each arch with two parallel circular braces bolted together, the spaces being filled in with light cross braces to form a diamond pattern. These principals spring from shafts at the height of about 12 feet from the floor line. The roofs over the transepts are cross-braced. Wrought boarding covers the whole, and the timbers throughout have been stained and varnished. The nave is seated with open stalls of stained and varnished deal. The transepts are seated with movable benches. The stalls in the chancel are of more elaborate design. The church affords accommodation for about 960 persons. Provision is made for an organ in a chamber over the vestry. The pulpit, on the north side of the chancel arch, has a stone base, formed of a cluster of small octagonal shafts encircling the centre pillar. The upper part is of deal, carved with a simple ornament. The font is plain, and harmonises with the general character of the church. The floor is laid with red and black Staffordshire tiles in various patterns. The windows are glazed with cathedral glass, the circles in the upper portion of the nave windows being filled with ornamental designs. The chancel is lighted by a corona, by Skidmore, of Coventry, who has also supplied the standards in the nave, and the small corona which lights each transept. The entire cost of the building is, we believe, about £5,000.

Rutland.—Ketton Church.—The work of reparation is progressing. Mr. G. G. Scott is the architect. The pulpit is being carved by Mr. Irving, of Leicester. The tower is now reached by a turret staircase, erected on the site of a former one. In the early part of the present restoration a portion of a fresco was found on the north wall: it exhibited the figure of a bishop, and a church in the background; it has been entirely obliterated. One of the chamfered arches that support the tower is enriched with graceful foliage, the date of which may be ascribed as early as towards the close of the twelfth century; it is a very interesting example of artistic painting of the period. The Rev. P. H. Sutton has filled the lancet at the west end of the north aisle with stained glass; it exhibits four pictures, representing the Evangelists. The new central western window is in the Decorated style.

Worcester.—St. Mary's Church.—A stone reredos has just been erected in this church; the stone-work of a new east window is also completed, from the designs of Mr. W. J. Hopkins, architect to the Church Diocesan Society. The reredos is of Bath stone, in the usual arcaded form, there being three central compartments, with two others on each side. The central ones have trefoiled heads, with a quatrefoil over, and a crocketed canopy; but the side compartments are without canopies, a diapered ground and quatrefoils occupying the space between them and the cornice, the mouldings of the latter showing a row of ball-flowers. In the central compartment is the sacred monogram "I.H.S.," with the words "Do this in remembrance of me," and in those on either side respectively the dove and the triangle. The side arcades will contain the Commandments, the Creed, and the Lord's Prayer. In the quatrefoils, spandrels, and capitals of shafts, is some carved work. The new window is in the Decorated style, with three lights and flowing tracery. It is filled, by Messrs. Clayton and Bell, with the subject of the Ascension, the centre light being carried up higher than the side ones to admit the ascending figure of our Lord. Beneath are eleven Apostles and the Blessed Virgin. In the upper part of the tracery the three Angels, bearing the words "Pater," "Filius," and "Spiritus," and below are the evangelistic symbols.

Cambridge.—Barnell Church.—This building has been opened after undergoing considerable restoration. In the summer of 1860, the new roof of the church was re-leaded, many portions of the old timber removed, and the interior of the open roof, which ranks amongst the finest specimen of roofs of the fifteenth century, thoroughly restored. In the spring of 1861 the roof of the north aisle underwent the same complete restoration. In the same year the west arch was thrown open, and the tower thrown into the church. The columns and arches have also been restored and the paint and whitewash removed from every portion of the church. These, as well as other substantial works, have been carried out. The roofs have been re-leaded. The whole area of the nave and side aisles has undergone an entire restoration. The passages in the nave and side aisles have been laid with black and red Staffordshire tiles, and the other portions of the church have been filled up with oak seats of a uniform pattern, in harmony with the date of the building. The new pulpit and reading-desk, carved after the pattern of some portions of the old screen, which still remains, have been placed at the north and south side of the chancel arch.

Chester.—St. Mary's Church.—The long-desired improvement to this church—the raising of its tower—is now finished, as far as the masonry work is concerned. As contrasted with its former diminutive and insignificant height, and hidden, as it was, by the Castle walls, the new tower presents a striking appearance. The total expenditure for all the improvements and restorations which have been effected at St. Mary's will exceed £1,600.

Wilts.—St. Peter's Church, Marlborough.—A meeting was held on Thursday se'nnight to take into consideration the propriety of employing an architect to inspect the fabric of the church with a view to ascertain its present condition, and a resolution was unanimously carried:—"That Mr. Wyatt, the diocesan architect, be requested to inspect the fabric of the church, and report thereon."

Essex.—Coggeshall Church.—On the 11th inst. a meeting of the Committee for the restoration of this edifice was held to meet the architect, Mr. Christian, and to consider the question of repewing the building. Upon the recommendation of Mr. Christian it was decided that the organ should be removed to the north chancel aisle. It was also decided to repew the church with oak sittings. The expense is estimated at about £1,000.

CHAPELS.

Liverpool.—Norwood Independent Chapel.—The foundation stone of this chapel, now in course of erection, was laid on Tuesday se'nnight. The following sketch of the plan of the building is taken from the "Congregational Year Book":—"The style adopted is the Decorated Gothic, and the material of construction will be red sandstone, with Stourton stone dressings. The main entrance will be through two doorways, coupled under one arch, immediately beneath a four-light window, which from its design and size will form the principal architectural feature of the elevation. On either side of the entrance porch is a lofty turret, and the front is flanked on each side by semi-octagonal projections to contain the gallery staircases. In plan the building will consist of the entrance porch, opening into a spacious corridor, which will be divided from the chapel by a glazed screen of appropriate design. Doorways at either end will lead to the gallery staircases. The chapel itself is a parallelogram in form, with the pulpit or platform in advance of an apse, with groined ceiling. In the rear of the chapel, on the ground floor, will be large vestries, a ladies' room, and other apartments; and above these a lecture-room and library. The chapel ceiling is plastered, and in a vaulted form, with considerable space between it and the roofing. It is divided into bays by groined ribs springing from stone columns attached to the walls. In the construction of the fittings every attention will be paid to the comfort of the congregation, and the best means of securing perfect ventilation, heating, and lighting will be adopted. The chapel, when the galleries are completed, will contain sittings for from 850 to 900 persons. The cost of erecting the chapel, with vestries and lecture-room (but exclusive of the schools, which it is not proposed to erect at present), will be about £4,600. Messrs. Poulton and Woodman, of Reading, are the architects.

SCHOOLS.

Birmingham.—Lozell's Chapel Day Schools.—On Monday evening last this building was formally opened; it is built of brick with stone and coloured brick dressings. The principal room of the school is 60 feet by 25 feet, and connected with it is an infants' room, about 20 feet square. The school-room is surrounded by a spacious play-ground, which is fitted up with gymnastic appliances suited to children. Mr. T. D. Johnson, of Bennett's-hill, is the architect, and Mr. W. Bennett the builder.

Potters-bar, Middlesex.—An infant school has just been erected here at the sole cost of the Rev. H. G. Watkins, the incumbent, the site having also been presented by him. The school-room is 22 feet long by 15 feet wide, the height to the ridge being 22 feet. The roof is constructed of open timber, plastered between the rafters, which, with all the other internal woodwork, is stained and varnished. The porch is paved with Minton's tiles. A commodious residence for the mistress is attached. The external walls are constructed of picked stock brickwork with Bath stone dressings; a few red malms and white Suffolk bricks have been used. Bangor and Westmoreland slates in broad bands have been used for the roof, with ornamental ridge tiles. There is a bell turret, covered with zinc, and surmounted by a wrought-iron vane. Mr. E. H. Lingen Barker, of 30, Upper Berkeley-street, was the architect, and Mr. J. F. Williams, of Potters-bar, the contractor for the works, the total cost of which has been about £500.

Correspondence.

THE EXCLUSION OF FOUL AIR FROM DWELLINGS.

SIR,—Allow me to call your attention to that part of the discussion on "Healthy Dwellings" at the "Institute" last Monday week, when Mr. Rawlinson, of the Board of Health, expressed himself unable to compliment the architectural profession on the usual structural provisions of a sanitary tendency. While Mr. Rawlinson was making this statement, the letter I now beg to enclose was lying unacknowledged on the shelves of the Board.

If the Board of Health restrict itself to external drainage, and the letter did not, therefore, come within the scope of its functions, would it not have acted consistently in keeping its officers out of Windsor Castle?

Communication to the Board of Health, December, 1860, on the Ventilation of Drains, and the Exclusion of Foul Air from Dwellings.

The great and valuable attention directed to sanitary objects in recent times, not only in their general and leading bearings, but also in points of detail, encourages me to offer a suggestion for the perfect ventilation of house drains, and of preventing the escape of noxious gases into dwellings.

Very great advantage has unquestionably resulted from the modern practice of ventilating public sewers, and of securing out the whole of their contents by flushing them with large quantities of back water; but it is, nevertheless, a fact of daily experience, and quite beyond the necessity of demonstration, that vapours and gases of the foulest and most hurtful kind are ever ready to penetrate into the interior of every dwelling, and in a larger degree, perhaps, into those of the superior classes, which are more amply supplied with sinks and internal waterclosets.

From the public sewer a branch-drain is carried, it may be observed, into every house, to the different parts of which it ramifies, for receiving rain-water, and the waste from sinks and waterclosets. It is customary to place an effluvia-trap at the mouth of each branch-drain within the chief sewer, while at every inlet from the surface and from the sinks precaution is taken to prevent the efflux of foul air by the application of some form of stench trap. Still, from impurity in these provisions, carelessness or inadvertence in their use, a considerable quantity of foul air finds its way into most houses.

Another and a still more important source of such inconvenience is generally found in the waterclosets.

The great variety of apparatus of this kind shows its importance in a commercial point of view, and indicates the vast extent to which conveniences of this description are now applied, and (as it would also seem reasonable to suppose), the perfection to which the manufacture has been brought; and the small proceeding from waterclosets continues most perceptible, and the gases from which small arises most injurious to health.

If it be borne in mind that a soil pipe, usually of lead, conveys the contents of the closets into the drains, it will be seen that except the effluvia trap above referred to, which from its construction is hardly susceptible of very exact or perfect action, there is no obstacle to the passage of the foul air from the sewers until we come to the trap or apyon of the closet; and the soil pipe may thus be considered as a large reservoir of impure air, ready to escape upwards at every opportunity, and such opportunities appear to be afforded on every occasion when the closets are brought into action.

In recently carrying into effect a design for a dwelling house, convenience and economy induced me to have the soil-pipe extended upwards from the uppermost watercloset to the gutter, so as to receive the water from the roof, and act as a substitute for the ordinary stack-pipes.

I found here, that a most valuable and simple means had been accidentally acquired for affording the most perfect ventilation to all the drains of the house, there being an unchecked escape for light aqueous vapour and foul air into the open atmosphere above the house.

In cases where the rain water could not be conveniently conveyed to the soil-pipe, a smaller tube for ventilation carried above the roof or otherwise into the external atmosphere might be sufficient; or the object would be effected by terminating the soil-pipe in a flue similar to those for smoke, and rising to the same height.

Although it is a common rule with architects that no watercloset ought to be without a window opening to the exterior, an acquaintance with the arrangement of London houses shows the exceptions to so wholesome a regulation to be very numerous indeed; and, in such cases, the improved method of ventilation here pointed out, would, I presume to think, be of the utmost value.

There being neither proprietary or other exclusive interest or impediment connected with this plan, which has also the further advantage of being at once simple and economical, I feel that the supporting sanction of qualified judges can alone be necessary to secure its appreciation, and general adoption by the public.

THOMAS MORRIS.

Carlton Chambers, 12, Regent-street, S.W.

THE ROYAL ENGINEERS.

SIR,—The present time seems to me to be that for again drawing the attention of your readers to a public department which requires the searching eye of scrutiny in all its transactions, agitations of every legitimate kind, and the assistance of all who wish things to be done in a proper manner, to prevent its gradually settling down into (if nothing worse) what has been so justly termed its "present anomalous position." I allude to the Royal Engineer Department.

About and before this time last year, scarcely a week passed without a letter appearing in the BUILDING NEWS referring to this subject. I myself was favoured by you, and, therefore, again take the liberty of asking for space for the insertion of this letter.

The advocates of a change in or re-modelling of the Royal Engineer Department have received the most valuable assistance from a source whence least expected—from an officer of Royal Engineers (in spite of himself he is betrayed), who, in the January number of Colburn's *United Service Magazine*, exposes more than could have been possibly expected from any criminal, however repentant and conscientious.

We there see, in all its hideousness, an admission of incompetency the most complete, of waste of public money the most enormous, of injustice to civil officers the most glaring, and, at the same time, assurance the most unblushing. We find that the corps of Royal Engineers have been drawing, in pay and allowances from the National Exchequer, thousands of pounds which they have never earned; that they have been in positions of authority and power, and vested with the expenditure of public money on works and buildings, without having the experience necessary to qualify therefore; that they have hitherto effectually persuaded the authorities that they were the *élite* of the department, instead of the millstone hanging about its neck; and yet after doing this, and much more, have the hardihood and assurance to ask for another lease of sinecure, another trial in a deception still more deceptive, to break down in a more deplorable manner than has the present system, because on a more extensive scale; and as for their position before the country was not sufficiently pitiable after such confessions, they make it still worse by throwing calumny and scandal on those without whom they would not have maintained their positions up to this time, and endeavour by so doing to hoist themselves into what I just now termed another trial in deception. Let us hope that no one will fall into the snare; or when it comes to "paying the piper," it will be found that the tune has been a dear one.

The writer in Colburn's Magazine evidently wrote for the information of the military, not caring to appear in any other garb, with his "architects," "surveyors, and civil engineers," creatures of a year, as a contrast to those of "less than a month," and in either case equally ridiculous—with his insult to the professions by any such terms being applied to what such periods could afford; and not even satisfied with this, but endeavouring to insinuate that the professions of architect, surveyor, and civil engineer, are not only to be acquired by any one who may be fortunate enough to obtain admission at Chatham as a Royal Engineer Officer in twelve months (hitherto one month) but also that soldiers are to be manufactured from the rough stone into a polished gem by a curriculum which he is pleased to designate a course in practical architecture, &c.

Truly these professions are coming to something, other than desirable if this is the case; I need not, however, add, that the ignorance of the engineer officer in everything pertaining to them must be marvellous, or he would never have ventured on so palpable an absurdity, which forcibly reminds me of the caution my father once gave me, "Don't play with edged tools till you know how to use them, for in unskilful hands they frequently injure those who attempt to use them."

The whole article is a compound of despair, ignorance and malevolence; despair at the state to which the corps has arrived—that some change or other must be made, and that this change will most likely affect them very seriously in two most important points, pocket and position, and consequently imploring a prolongation, if not a permanent settlement of what they have so long held, at whatever sacrifice of that right principle which should possess every man—that he gives money's worth for the money he receives; and although accompanied by such a confession as that walled forth, it requires no great stretch of imagination to picture to one's self the state of things which would cause even an officer of engineers to break forth into such lamentations, specious pleading, and betrayal of despair.

Ignorance (partially assumed) of the best thing to be done under the circumstances. I say assumed, because any man who has made such a confession of past inefficiency cannot possibly lack the discrimination to perceive that a remedy is to be found in removing the inefficient and making room for the efficient. Ignorance, also, of other men in imagining that they would take to any scheme proposed by a culprit, simply because he has made a partial admission of guilt and given a promise to behave better in future. Ignorance, also, of what he would wish to appear very conversant with, i.e., the necessary education and practice, in addition to inclination, to qualify for even a very trifling insight into civil professional knowledge and duties.

Malevolence, inasmuch as no other motive could have instigated any man to publish such a calumny as that which is implied against the civil officers of the department. Why did not the writer specially allude to cases, instead of, by implication, calumniate a body of men upon whom, and whose honesty and integrity, he has so frequently been dependent, and whose characters will bear as much inquiring into as will those of the officers of the corps of which he himself may be a member. If such black sheep exist, and he knows them, he has been guilty of a gross dereliction of duty in not bringing the matter to the notice of the authorities, because such men should not be allowed to remain in any department so honorable, although so ignored, as the Royal Engineer Department. It is not so. It is that if, even by calumny and slander, under the shelter of the calumnistic tree, he can gain, or

even advance, his point, he will try those means. I do not envy him his reflection, neither the chance he has of, after having "sown the wind," his "reaping the whirlwind."

With your permission I will on a future occasion advert to this subject, and endeavour to afford some little information on the details of the scheme, as also on the most important principle in connexion therewith, viz., the expense attendant on the introduction of what, without the slightest evidence of its being so, is termed "a self-supporting scheme."

P. ETARD.

February 25th, 1862.

TENDERS.

OFFICES, DARLINGTON.
For the erection of offices in connection with the New Engine Works at Darlington, for the Stockton and Darlington Railway Company. William Peachey, architect.

COMPETITIONS OPEN.

BRIDGES.

DUBLIN.—The committee appointed to carry out the new Carlisle bridge (Dublin) scheme, require plans and specifications for the erection of the structure on the present site, the full breadth of Sackville-street, £200 will be paid for the best and most approved plan, £100 for the second, and £50 for the third. The plans, &c., to be the property of the committee, to whom applications are to be made at the Imperial Hotel, Sackville-street, Dublin.

HARBOR WORKS.

LYME REGIS.—The Borough Council require a plan, specification, and estimate for carrying out certain works at the Cobb or harbor there; to be sent in to G. Hingerton, town clerk, by March 1st, when the successful competitor will receive 15 guineas. Full particulars can be had at the offices of the Cobb clerk or town clerk, Lyme Regis.

LAYING OUT.

TRAMMERE.—The directors of the Trammere Freehold Land Society desire plans, before the 25th March, for laying out and allotting the estate belonging to the Society, in Higher Trammere; consisting of about 40 statute acres. Premiums will be given for the best and second-best plans. Each plan to be accompanied with an estimate of the cost of the formation and construction of the roads and sewers, and also of the laying out of the land. Particulars from Mr. John Quinn, Chairman of the Society, 22, Lord-street, Liverpool; or from Mr. H. P. Priest, Secretary, Market-cross-chambers, 19, Market-street, Birkenhead.

CONTRACTS OPEN.

PAVILION.

WORCESTER.—For the erection of a pavilion, to be constructed of wood and glass, for the Worcester Pleasure Grounds Company, Limited. Plans, &c., at the offices of Mr. A. P. Watkins, 50, Foregate-street, Worcester, and bills of quantities obtained of the architect, Mr. Cranston, No. 1, Temple-row-west, Birmingham. Tenders to be sent to the secretary, endorsed "Tender for Pavilion," on or before the 8th March.

PIER.

BLACKPOOL.—For the erection of an iron landing and promenade pier, for the Blackpool Pier Company, (Limited.) Plans, &c., on Monday the 3rd March next, at the office of Messrs. Birch, the engineers to the company, 43, Parliament-street, London, S.W., or at the Company's office, Blackpool; and bills of quantities will be furnished on payment of ten shillings. Sealed tenders by the 10th March next, addressed to the chairman of the Blackpool Pier Company, Blackpool.

CHURCHES.

BIDEFORD.—For rebuilding Bideford Church. Plans, &c., on application to the rector, till the 3rd March. Sealed tenders addressed to the secretary, on or before March 10th.

WAKEFIELD.—For the erection of a new parish church, at Ossett, near Wakefield. Plans, &c., with W. Henry Crossland, architect, Harrison-road, Halifax, to the 28th inst. Sealed tenders, endorsed "Tender for the New Parish Church, Ossett," to be delivered to Mr. Crossland, on or before 3rd March.

PRESTON.—For the erection of the whole or any portion of a new church, to be built at Preston. Plans, &c., at the Upper School-room, Wellfield-road, Preston, and also at the office of the architect, Mr. E. G. Paley, Lancaster, to 18th March, inclusive. Tenders to be sent in under cover to the Rev. Thomas Clark, West Cliff-terrace, Preston, endorsed "Tender for St. Mark's Church," on or before March 22.

CHAPELS.

BRISTOL.—For the erection of the Clifton Wesleyan Chapel. Drawings, &c., with Fosters and Wood, architects, 6, Park-street, Bristol, till the 28th inst., on or before which the tenders are to be sent to the architects, sealed and endorsed "Tenders for Clifton Wesleyan Chapel."

BRADFORD.—For the erection of the new Baptist Chapel, Manningham-lane, Bradford. Drawings, &c., at the school-room of St. John Chapel, Bradford, Yorkshire. Tenders for the whole or parts of the works will be received up to 10 o'clock on March 8th.

CROYLAND.—For the erection of a new school-room and additions to the Wesleyan Chapel, Croyland. Plans and specifications at Mr. Sanderson's, chemist, Croyland, where tenders to be addressed to and delivered on or before the 1st March.

GLOUCESTERSHIRE.—For the erection of two chapels and entrance lodge and gates for Painswick Cemetery, Gloucestershire, and for laying out the grounds and fencing. Plans, &c., on application to the Rev. A. J. Biddell, vicar of the parish. Sealed tenders (separate) to be addressed to the Rev. A. J. Biddell, and sent in before 11 o'clock on the 5th March.

PETERBOROUGH.—For the erection of a new Primitive Methodist Chapel and School-rooms. Tenders to the Rev. J. Ashworth, Hampden-street, Boonfield, Peterborough, by March 11. Plans, &c., with Mr. Robert Lee, Millfield, near Peterborough.

VICARAGE.

MONMOUTHSHIRE.—For the erection of Caerleon Vicarage-house, three miles from Newport, Monmouthshire. Plans, &c., at the King's Head Hotel, Newport; and tenders may be sent to Pritchard and Seddon, diocesan architect, 6, Whitehall, London, on or before the 15th of March.

PARSONAGE.

PERTH (N.B.).—For the erection of a new manse and office, at Dunning, Perth, N.B. Drawings, &c., with the architects, William G. Habershon and Pite, 38, Bloomsbury-square, London; and on application to the clerk of works (Mr. Jones), at Dancrub-park, Dunning.

COTTAGES, &c.

SOUTH DEVON RAILWAY.—For the erection of twenty-five cottages and a block of flats, at the Newton station, on this line. Drawings, &c., with Mr. Rowell, architect, Station-road, Newton Abbot; and tenders are to be sent to P. J. Margary, engineer's office, Dawlish, on or before the 8th March. Printed copies of the specifications and conditions of contract will be supplied to the contractors at a charge of 10s.

ALTERATIONS.

MAIDSTONE.—For certain alterations and repairs to a house in the West Borough, Maidstone adjoining the railway station. Plans, &c., with Mr. Bulmer, architect, Maidstone, any day except Sunday, between 10 and 5, where bills of quantities may be obtained on payment of 5s. Sealed tenders, endorsed "Tender for Alterations to House," are to be delivered at Mr. Bulmer's office on or before the 5th March.

RAILWAY WORKS.

IRELAND.—For the construction of the works upon the Midland Counties and Shannon Junction Railway, between Clara and Banagher, and commencing at a point a mile and a half from the Junction of the Midland Great Western and Great Southern and Western Railway Companies, on to Banagher, a distance of about 17½ miles. Plans, specifications, quantities, &c., are to be seen with the engineers of the Company, John Hill, Esq., Tullamore, and Henry Brett, Esq., 8, Harrington-street, Dublin. Tenders to be sent in not later than the 8th March, at 12 o'clock noon, endorsed "Tender for Works," and addressed to J. Fowler Nicoll, secretary, offices of the Company, 53, Lower Dominick-street, Dublin.

BRIDGES.

BOLTON.—For the erection of a timber bridge across the river Irwell, at Agecroft-bridge. Plans and particulars at Mr. A. Pilling's, Contractor's office, Davenport-terrace, Bolton.

LEICESTER.—For the cast-iron girders and parapet, and the wrought-iron work required for a bridge of 40 feet span to be erected over the river Soar, at Leicester. Drawings, &c., with E. L. Stephens, Borough Surveyor, Local Board of Health offices, Silver-street, Leicester, and the tenders for the same, including delivery and fixing, are to be sent in not later than the 12th March, endorsed "Tender for Ironwork," addressed to the Chairman of the Highway Committee.

WATERWORKS.

WELCHPOOL.—For laying and jointing about 6,500 yards of cast-iron pipes, and for providing and fixing sluice cocks, hydrants, and other works, for the Welchpool Waterworks. Specifications, &c., may be obtained of Messrs. Robert Dymond and Sons, surveyors, Exeter, at 10s. 6d. each. Tenders by March 10.

LEITH (N.B.).—For executing repairs on the water-house of Lochend Loch, cutting pipe tracks, &c.; also for furnishing and laying about 300 lineal yards of cast-iron pipes, 9 inches diameter, and furnishing and fitting-up sluice and scouring-cocks, air-cocks, &c. Plans, &c., with Mr. Paterson, C.E., 20, St. Andrew-square, Edinburgh. Offers endorsed "Tender for Waterworks," to be lodged with Mr. Anderson, Town Clerk, Leith, on or before 13th March.

MILITARY WORKS.

SCOTLAND.—For contracting from 1st April, 1862, to 31st March, 1863, inclusive, for the performance of such artificers' work as may be required at the under-mentioned stations, viz.:—Edinburgh Castle; Piershill Barracks; Leith Fort, Martello Tower, and Blackness Castle; Greenlaw Military Prison and Barracks; Perth Barracks; Dundee Barracks and Broughty Castle; Dunbar Barracks; Berwick and Holy Island; Glasgow Barracks; Dumbarton Castle; Paisley Barracks; Hamilton Barracks; Ayr Barracks; Fort Matilda; Stirling Castle; Aberdeen Barracks, Beach and Torry Point Batteries; Forts George, Augustus, and William. In all cases, the seven trades are to be in one tender for each station, and the contracts to be determinable at any period after the first year, on either party giving to the other three months' notice in writing. Any person may tender for one or more of the above stations. Parties applying for forms of tender must give sufficient guarantee to the entire satisfaction of the commanding royal engineer of their being fully competent to undertake and execute any new works or repairs that may from time to time be ordered on the contract schedules. Every information on application to the Royal Engineer or Barrack offices, at the several stations herein named, together with printed schedules of the prices, with the terms of contract and letter of tender for the several descriptions of artificers' work, to the 27th February, upon making a deposit of five shillings for the same. The letter of tender to be sealed, and transmitted under cover to the Director of Contracts, War Department, Pall-mall, London, S.W., so that it may be received on or before the 10th March, 1862, and to be marked on the left-hand corner of the envelope, "Tender for Works at ———."

WOOLWICH.—For executing the work, &c., that may be required in the following trades, for the period from the 1st April, 1862, to the 31st March, 1863, viz.: bricklayers, masons, paviors, carpenters, plasterers, slaters, plumbers, smiths and ironfounders, painters, glaziers, and paperhangers, and gasfitters. Parties desiring to tender to leave their names at the Royal Engineer Office, Woolwich, on or before 8th March, and pay 7s. 6d. for schedules and forms of tender.

DUBLIN.—For the performance of such artificers' work as may be required at the under-mentioned stations, from the 14th April, 1862, to 31st March, 1864, inclusive, viz.:—Dublin District, as per schedule B, Athlone, with 5 per cent. in addition for rifle range; Mullingar, with 8 per cent. in addition for rifle range. The contracts to be determinable at any period after the first year, on either party then giving to the other three months' notice in writing. Information to be had at the District Royal Engineers' Office, Dublin, and at the Royal Engineers' Office, Athlone, or to the Barrack Master at Mullingar; and printed schedules of prices, with terms of contract and letter of tender, may be had on

depositing 10s. Tenders sealed to be transmitted under cover to "The Director of Contracts, War Office, Pall-mall, London, S.W.," marked on the outside "Tender for Work at Athlone or Mullingar" (as the case may be), before March 15th.

ROADMAKING, &c.

IRELAND.—For the following works, in the barony of Gorey, in the county of Wexford:—1.—For making a new line of road from the corner of the Post-office in Gorey, to Edward Foley's cottage in Ballyraheen, containing about 415 perches; not to exceed £500. 2.—For making a new line of road from Gorey to Tinahely, containing about 300 perches, in the townland of Ballingarry. Plans, forms of tender, &c., obtained, at the office of Henry E. Wynne, secretary to the Grand Jury, County Court House, Wexford.

PAVING, &c.

NEWINGTON.—For the supply and doing of such paving and curbing to the extent, as to paving, of about 60,000 feet super; and, as to curbing, to the extent of about 14,000 feet lineal; and also for the supply of such broken granite (Guernsey, Bombay, and Port Phillip), flints, Kentish rag, gravel, and smith's work, as the vestry of St. Mary, Newington, Surrey, may require of the contractor, from the 25th March next until the 25th March, 1863. Particulars, &c., with H. and F. Chester, joint clerks to the Vestry, 1, Church-row, Newington-butts, to whom tenders must be sent before 6 p.m. on the 10th March, and the several persons willing to contract must attend the Committee at 7 o'clock on the same evening.

BRIDGE.

BRISBANE RIVER.—The Municipality of Brisbane are prepared to receive designs and tenders for the construction of a bridge over the Brisbane river, at Brisbane, the capital of Queensland. The author of the best design, at the lowest cost, will receive a reward of £150, or be employed to carry the work out, providing he furnishes sufficient proof of his competency and experience in similar undertakings. A premium of £80 will be awarded to the next best design, and £40 for the next best. The plans, specifications, and estimates of the first and second designs will be retained by the Corporation as their property. The remainder will be returned to the competitors; but the corporation will incur no responsibility as to their safe delivery. Each set of drawings, and the documents accompanying them, are to be distinguished by a motto only, and accompanied by a letter in a sealed envelope, marked with the same motto, and containing the author's name and address, and such testimonials as he may think proper to furnish. Professional judges, being non-competitors, will be appointed by the Corporation to determine the merits of the respective designs. Eligible tenders for the work, accompanying the design, will be entertained. All drawings and tenders to be delivered at Gresham House, on or before the 15th of March next. Copies of the instructions to competitors, and the plan of the city, can be obtained of F. Mangles and Co., the Colonial agents, and agents to the Municipality of Queensland, 86 to 88, Gresham House, Old Broad-street, London, E.C.

SEWERAGE, &c.

OXFORD.—For constructing an open sewer along a portion of the Trill Mill Stream in the city of Oxford. The drawings, &c., at the Commissioners' office, Town Hall, Oxford; or particulars obtained from Mr. John Galpin, surveyor. Tenders, on printed forms, which may be obtained either of the clerk or the surveyor to the Commissioners, must be delivered, sealed, to Frederick J. Morrell, clerk to the Commissioners, No. 4, St. Giles's-street, Oxford, on or before twelve noon, on 10th March, endorsed "Tender for Open Sewer."

HANTS.—For laying pipes, erecting filter tanks, and executing other works for the drainage of the town of Alton. Copies of the quantities, with forms of tender (price 2s. 6d. each) may be obtained, and the specifications and drawings inspected, on application to William Trimmer, clerk to the Board, Alton; or to Mr. T. W. Penfold, 2, Charlotte-row, Mansion-house, London. Tenders to be sent in on or before 4th March.

ROTHERHAM.—For the execution of such drains as the Vestry may direct to be performed in the parish of Rotherhithe. Printed forms of tender and schedule of works, with conditions, may be obtained at the clerk's offices, 61, Paradise-street, Rotherhithe; or of Mr. George Legg, the surveyor, 61, King William-street, London-bridge. Tenders, accompanied with the name of one responsible person as surety, to be sent to the clerk's offices on or before 12 o'clock on the 4th of March.

ROTHERHAM.—For supplying, for the use of the Vestry of the parish of Rotherhithe, Guernsey granite spalls, York paving, half-sovereigns for carriage paving, curb, &c., for one year, to be delivered alongside wharf at Rotherhithe. Forms of tender and schedule of articles to be supplied may be obtained at the clerk's office, 61, Paradise-street, Rotherhithe. Tenders to be sent to the clerk's office by 12 noon of the 4th March.

ISLINGTON.—For the day and jobbing works in connection with the construction and repairs of sewers and gullies, in the parish of St. Mary's, Islington. The form of tender and contract, which slons will be received, may be had at the Vestry offices, Upper-street, Islington, on payment of 2s. 6d. Sealed tenders must be sent in on or before 10 o'clock on March 12th.

DUMFRIES.—For constructing and completing a main sewer and its appurtenances, in the White Sands, Dumfries. The sewer will be about 500 yards in length, and to be built of bricks with fire clay invert blocks. The section, &c., with James Barbour, C.E., Buccleuch-street, Dumfries; and tenders to be lodged with William Martin, town clerk, on or before 20th March.

DRAINAGE, &c.

SURREY.—For the execution of road making and road drainage on the Conservative Land Society's estate, at Roehampton, Putney, Surrey. The following rough quantities are stated in order to indicate approximately the extent of the proposed works, but parties tendering will have to take out quantities for themselves:—New roads 40 wide, including footpaths, 2,350 feet run; 9-inch drain pipe, 1,820 feet run; 6-inch drain pipe for gullies, 220 feet run; No. 20 gully cesspools with gratings. Plan, &c., at the office of the Society's surveyor, Mr. James Wilson, 33, Norfolk-street, Strand, W.C.; to whom tenders, endorsed "Tender for works at Roehampton," before March 8th.

SUPPLY, &c.

LONDON.—For the supply of materials and the execution of the day jobbing and measured works of the Metropolitan Board of Works, in respect to the main sewers and incidental works within the limits indicated upon maps deposited at the office of the Board, Spring-gardens, S.W. Tenders must be made separately for each of the areas shown upon such maps—viz.:—Area coloured pink and marked A, area coloured yellow and marked B, area coloured yellow and marked C. Tenders to be upon the bases of schedules of prices, and to be made for alternative periods of one, two, or three years. Parties desiring to tender may, upon payment of 5s., obtain printed forms, with general conditions, on application to Mr. J. W. Bazalgette, Engineer of the Board, at the office of the Board. Each tender to include neither more nor less than one of the coloured divisions upon the maps, and is to be endorsed "Tender for works in the ———" (the description of the area to which the tender is to apply being inserted). Sealed tenders must be delivered at the office of the Board on or before the 6th March, at 4 p.m. The parties tendering must be in attendance at the Board at 12 o'clock on the 7th March.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient. J. T. S. E. D., O. W. H. C., A. T. E. R. B., T. W., W. J. O. F. C. E., H. B., E. E. R. J. C., H. K., D. I., L. F. E. Z., E. B. R., W. G., G. T., F. Y. P., D. W. (Southport), A. G. (Oswestry), Subscriber, C. R. A. F., Z. A. C., G. E., T., Theodolite.—Next week.

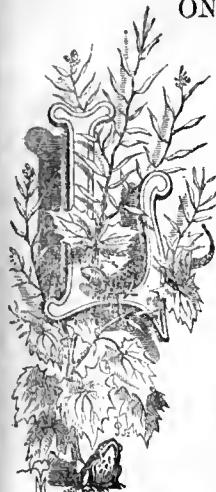

NOTICE.

The Seventh Volume of the BUILDING NEWS is now ready, bound in cloth, price 21s. Subscribers can have their copies bound, either with or without the advertisement page, for 4s. 6d., on sending them to the office. Cases ready for binding the volume may be had price 2s. each.

* * * All communications to be addressed, The Editor of the BUILDING NEWS, 20, Old Bowell-court, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Bowell-court.

Advertisements are received up to six o'clock on Thursdays.

STRAND IMPROVEMENTS.

LONDON'S great artery of traffic—the link between the commerce of the City and the fashionable life of the West-end—is on the eve of undergoing considerable change by the realisation of two projects which, it is said, will be shortly commenced. We allude to the proposed Temple-bridge, and to the new hotel that is to be erected on the site of Lyon's-inn, and to the new Courts of Justice. Any fresh appropriation of the localities would be an improvement—architectural quite as much as social and moral. But, before endeavouring to forecast the results of the new works, and their influence in widening channels for traffic, let us take a glance backwards, with Mr. Peter Cunningham and Mr. John Saunders for our sure, erudite, and pleasant guides, at the old features of the Strand and so much of Fleet-street as will be affected by the contemplated alterations.

Temple-bridge is to start from the foot of Essex-street, and cross the river to Princess-street, Upper Stamford-street—one of the sites reported on by the Select Committee of 1854 as

requiring bridge accommodation. The structure is to be similar to the one being erected at Lambeth, and is to be by the same architect or engineer, and contractors. The spans are to be 300 feet; and the total cost £45,000—not a twentieth part of the cost of its neighbour, Waterloo-bridge. Essex-street, which is to be the approach to the site of the new bridge, is part of a site that has been illustrated by some of the most startling and romantic incidents of English history. It formed part of an outer temple wherein was one of the residences of knights. From their hands it passed into the possession of the Bishops of Exeter, and the old structure became their episcopal residence in London, whence the title of Exeter House. No less than nine bishops had their inns in the Strand, from the motive given by Selden, that their persons were held sacred, and they consequently had no cause to fear for their safety, while others were compelled, for the sake of security, to live within the City. One of the episcopal inhabitants—Miles Stapleton—who improved the edifice, was beheaded in Cheapside by the mob, because he was a friend of Edward II.; the corpse was buried beneath a heap of rubbish in front of the palace door. From the Bishops' possession Exeter House passed into the hands of Lord Paget at the Reformation; next to the Duke of Norfolk—to that duke who purchased and in part rebuilt the Charter House, who meditated marriage with Mary Queen of Scots, and who was beheaded on Tower-green for treason; then to Queen Elizabeth's first favourite—Leicester—and from his nephew, Sir Robert Dudley, to the most unfortunate of all the Virgin Queen's favourites, Robert Devereux, Earl of Essex, who gave it its last title, Essex House. When it was known as Leicester House, it had sheltered Spenser, and Sir Nicholas Throgmorton died there, poisoned, it was rumoured, by the Earl. When Essex returned from Ireland, which he called the "cursest of all islands," and whither the Queen, after boxing his ears, had him "Go and be hanged," his house was thrown open to the disaffected and enterprising, and a strong party of his old officers took up their lodgings about Essex House, forming themselves into a guard and council. The popularity of the Earl with Londoners overshadowed and gave umbrage to the Crown, and encouraged him to attempt to forcibly remove from Court his enemies, including Sir Walter Raleigh and Sir Robert Cecil—Sheridan's Burleigh, that "shook his head, but there was nothing in it." On the second Sunday in February, 1600-1, followed by Southampton, Rutland, Sandys, Monteagle, and some 300 gentlemen rushed to St. Paul's Cross, expecting to find the congregation assembled, and to use it as a means for raising the City. But his foes had been beforehand; there was no preaching. Baffled and defeated, he made his way back by water to Essex House, which he hastily fortified with a view to defend it to the death. The Queen's troops brought artillery to bear, and planted a cannon on the tower of St. Clement's Church—not the present one, but the old structure that was pulled down 1682—which compelled the Earl to surrender. We need not follow him to his trial and execution. But how many who pass to and fro between St. Clement Danes and Essex-street pause to conjure up the bloody scene that was enacted two centuries and a half ago where they tread; the noise and smoke of battle; gallant Salisbury courting death at an open window, and crying out, when hit on the head, "Oh! that thou hadst been so much my friend as to have shot but a little lower;" the boom and flash coming ever and anon from the top of the old church tower; the shrill, hoarse cries of command interspersed with cries from the wounded, and

the veil of fog that fell over all like a pall dotted here and there by cressets?

A few years later and Essex House was the home of another Robert Devereux, but instead of being the victim, like his father, he was the vanquisher of the Crown. True, the roystering cavaliers who could not defeat the Parliamentary General nicknamed Essex House Cuckold's Hall, from the scandalous misconduct of his wife, the daughter of another of Elizabeth's victims—the Duke of Norfolk—which did not prevent the House of Commons, headed by their Speaker, the Lord Mayor and Aldermen, paying the Earl of Essex a congratulatory visit on the occasion of the battle of Newbury, when the untrained militia of London triumphantly withstood the tempest charge of Rupert's Cavaliers.

Coming down more than a century later, Essex-street affords another illustration of a very different character to the preceding one. The home of the knights, of bishops, and of Elizabeth's nobles was swept away, and on a portion of its site was and is still the Essex Head, where Dr. Johnson established an evening club.

The singular success which has attended the establishment of large hotels here on the American system, the promptitude as well as the extent with which visitors have patronised them, have led to the publication of proposals for building a new hotel on the site of Lyon's-inn. The ground has been leased for a long term of years, with the option of purchasing the freehold. It is premature to speak of the architectural character of the design, further than that the ground floor is to be appropriated for shops. When the New Concentrated Law Courts come to be constructed upon the site already pointed out, the hotel will be of great public convenience, and there can be no doubt of its proving highly remunerative to the shareholders, for good hotels are as profitable and sure investments as any. The selection of Lyon's-inn is singularly felicitous for the erection of an hotel. There it will not interfere with anything worth preserving, while it will promptly lead to the abolition of Holywell-street and to the widening of the Strand at that part. Lyon's-inn is an inn of Chancery belonging to the Inner Temple. It was originally a guest inn, purchased by law professors and students in the reign of Henry VIII., who converted it into a Chancery. It has not, so far as we are aware, a single historical association, though of great antiquity, to plead for its preservation; for the fact that during a few years, and until the establishment of the Architectural Union Company, Conduit-street, it sheltered the Architectural Association, cannot weigh with any one. It stands in Newcastle-street, named after John Holles, Duke of Newcastle, who died 1711. Holles-street, adjoining, is another souvenir, and is even more devoid of architectural merit than of antiquarian interest.

The site for the New Courts of Justice lies partly within and partly without the City. It is enclosed between Carey-street, Clement's-lane, the Strand, Fleet-street, and Bell-yard. Mr. Hayward in his report, which was read on Tuesday to the City Commissioners of Sewers, says, that on the area to be taken, only four or five houses are within the City, that Temple-bar is scheduled, and Shire-lane is to be destroyed as a thoroughfare. Here we are approaching ground which has the reputation of being connected with historical associations. Ben Jonson's haunts are to the east and south of Bell-yard, and will, therefore, not be touched. The only illustration that Mr. Cunningham mentions of Bell-yard is, that Pope wrote letters to a friend who lived there, which the poet spoke of as "that filthy old place." Shire-lane has some associations, but none sufficiently important to induce the toleration of the infamous purposes to which it is now devoted. In the upper part lived Bickerstaff, the Tatler; Elias Ashmole, the antiquary, resided there also. Theodore Hook and Dr. Maginn were both locked up at the same time in a spunging-house in the lane, which, even so far back as James I.'s time, had an *alias*, Rogue-lane. In the shop of a pastrycook, Christopher Katt, who was famous for his mutton pies, was established, in 1700, the Kit-Kat Club, composed of 39 noblemen and gentlemen, zealous partizans of the House of Hanover, among whom were Somerset, Richmond, Grafton, Devonshire, Marlborough, Newcastle, Dorset, Sunderland, Manchester, Wharton, Kingston, Somers, Halifax, Sir Robert Walpole, Vanburgh, Congreve, Granville, Garth, Addison, Maynwaring, Stepney and Walsh. But who now, great as might be his devotion to Whiggery, would have stomach for mutton pies made in Shire-lane? The club has long ceased to be; but the name is preserved in portraits of a certain size, from Kneller having painted the members of the club all on one scale, then quite new.

Temple-bar is scheduled, but we have reason to believe that it will not be removed. No architect will regret its removal, though it is the work of Wren, any more than will the historical student, for it is a comparatively modern innovation upon the ancient posts, rails, and chains which used to separate the City from Westminster; and the only thing to be remembered in connection with it is, that it served to hang up the heads and quarters of the gentlemen who suffered death for their loyalty to their king. From Temple-bar, on the north side, up to Wyche-street, the houses are all modern. The straits of St. Clement's,

Butcher's-row, where Sully once slept, and where Nat Lee got drunk on the night he fell and was stifled in the snow, on his way through Clare-market to his lodgings in Duke-street, and which was a continuation of Holywell-street eastward, was swept away to make room for Alderman Pickett's improvements in 1813. Clement's-inn, "where they will talk of mad Shallow yet," will not be touched. In St. Clement's-lane, part of which will be pulled down, lived Sir John Trevor, cousin to Lord Chancellor Jeffries, and twice Speaker of the House of Commons. He was found guilty of corrupt practices, and, as Speaker, had to put the question whether or not he ought to be expelled the House. Worst of all, he had to declare the question carried in the affirmative.

Neither Carey-street nor Boswell-courts, Old and New, call for notice. Lord St. Leonard's can scarcely be serious when he pleads on their behalf against the concentration of the Law Courts in the law neighbourhood.

OBELISKS.

THE decision of the Queen in the matter of the Albert Monument has naturally set men thinking upon the forms and decorations of obelisks. A simple obelisk may, of course, be easily designed—if the mere copy of an ancient work can be called design; but we believe that something more is needed than a mere repetition of one or other of the monoliths which once stood before the propylon of an Egyptian temple, and that the subscribers to the fund, as well as the public, will not quietly suffer the large sum collected to be frittered away upon an enlarged edition of the Waithman monument, or a huge replica of the hideous terminals to many Renaissance balustrades. The combination of sculptured groups at the base, with the thin tapering form of the obelisk, will test the resources of architects far more than would the design of a monument unlinked with any previously determined principal feature.

The grandeur seen in many of the old obelisks springs chiefly from the sense of durability which they convey to the spectator, being chiefly hewed and squared out of the "time-defying material," granite, and consisting of monoliths of unusual size. The mere form of a small obelisk has but little beauty to recommend it. It was, nevertheless, a happy stroke of art which forbore to carrying the tapering lines to a point, and splayed the sides of the summit pyramidally. The dignity of the obelisk is thus preserved, and its difference from a pyramid sufficiently marked. All obelisks have a greater or lesser family likeness, and all either were or were not intended to be what Strabo calls them—Books of History—covered on their four sides with inscriptions.

We purpose giving a brief description of the principal obelisks which still remain scattered amongst the ruins of Egypt, or which have been transported thence to European capitals. It is unnecessary that we should touch upon the question of their antiquity. We may take it for granted that they are "Messalet Pharaum," but whether Thothmes lived 1,000 or 3,000 years before Christ does not much affect our present purpose. Neither is it worth present inquiry, if Pliny's account be true, that Mitres, King of Egypt, was the originator of these monuments, and that they were first reared at Heliopolis, in honour of the Sun, which gave its name to the city. One phrase is, however, worth noting for its drollery. He speaks of Rameses "pitching on end an obelisk," which "carried in length one hundred foot wanting one"—as though the feat were as easily performed as setting up a five-foot rod.

Nearly all the Egyptian obelisks were set up in front of temples, one on either side of the doorway. The path leading thereto was, in many cases, an avenue of sphinxes, such as we see faithfully represented in the Egyptian Court, at Sydenham. This accounts for the obelisks being in pairs. There are two, for instance, at Alexandria—the famous Cleopatra's needles, although what that queen had to do with them we cannot tell, nor can any one, it appears, inform us. They stood originally at Heliopolis, and were brought thence by the Ptolemies. Like the majority of the Egyptian obelisks, these are of the red Syene granite, and are somewhat less than 10 diameters in height. One is still standing, the other lies prostrate by the side of it. It is this latter which was presented by Mohammed Ali to the English Government, but which has not been deemed worth the cost of transport. The standing column is 70 feet high, the fallen one, 66 feet. The pedestal on which the former stands increases its height by nine feet. It has suffered considerably, especially on the south side, from the effects of the atmosphere. The inscriptions upon its prostrate companion are almost obliterated. The desolation which surrounds them has earthed up the base of the one, and hidden all except the upper side of the other. Amongst the ruins of old Alexandria, by the "still-vex'd shore" of the Mediterranean, the monoliths of a dynasty long passed away rest more appropriately than they could if removed from the country, as well as from the city, to the glory of which they formerly contributed.

The celebrated Heliopolis seems to have been remarkably rich in obelisks. Besides supplying stone, which we have just alluded to, several of the European specimens have been brought thence, and at the present day its one obelisk, rising upwards of 60 feet, first greets the traveller's eye as he approaches the city from Cairo and Mataréich. The pedestal projects from the obelisk 2 feet on either side, without moulding of any kind. Abd'allatif speaks of "les deux aiguilles de Pharaon," of "la tête recouverte d'un espèce de chapeau en cuivre, en forme d'entonnoir qui descend jusqu'à trois coudées environ du sommet."

The broken obelisk near Baggig is peculiar, in so much as the apex is rounded instead of pointed, and, like that at Heliopolis, appears to have

been originally covered with bronze or other metal. A slight recess from the sides of the obelisk has given rise to this belief. The obelisk is in two fragments, but, complete, would have been about 40 feet in height and 4 feet in diameter.

The easternmost of the twin obelisks at Luxor alone remains there. Its companion is that which now forms the centre of the Place de la Concorde, at Paris. They are both splendid specimens, covered with a profusion of deeply cut inscriptions and hieroglyphics, in many instances exceeding two inches in depth.

In the adjoining ruins of Karnac there are two obelisks of large dimensions; one still stands, the other has fallen by its side. They are 92 feet in height and 8 feet square. They are surrounded by a peristyle of Osiride figures.

Higher up the Nile, just above the first cataract, on the island of Philæ, Belzoni procured the largest obelisk which we possess in England.

The obelisk in the At-Meidan, at Constantinople, is of granite, and partly covered with hieroglyphics. It is about 50 feet high, and is called after Theodosius, but it is believed that that Emperor removed it from another site, where it had been set up by Constantine. Nicetas, in the life of St. Ignatius, Patriarch of Constantinople, says that it had at its top a brazen pine-apple, which was thrown down by an earthquake. The pyramid of Constantine Porphyrogenetus, standing near, is sometimes called an obelisk, but it is really what we have designated it. It was covered with metal, as were, possibly, the apices of the obelisks at Heliopolis and in the Fyoom. The holes are visible into which the wooden pegs fitted which secured the metal casing.

The obelisks of Rome are eleven or twelve in number. They have all more or less been surmounted by Christian emblems, and fixed on ordinary Italian pedestals instead of the unmoulded plinth, standing on two or three steps, which the Egyptians deemed more appropriate to them. With the Egyptians the hieroglyphics were the principal feature of them; with the Popes they were the least considered. These latter regarded them as huge blocks, to be converted by minor ornaments into Christian monuments. They are, of course, the oldest monuments which the Eternal City contains, and nothing testifies so strongly to the enduring quality of these monuments as the fact of their still existing after repeated overthrow and neglect. With the exception of one—that in front of St. Peter's—all of them have been, since the period of their transport from Egypt, thrown down and, have lain uncared for amidst ruins, or been buried and forgotten until chance unveiled them to a more appreciating age. The old Roman conquerors had a passion for obelisks, and must have employed immense sums of money in bringing to Rome these trophies of their Egyptian conquests. This passion, after slumbering for ages, was rekindled in the middle of the sixteenth century by Sixtus V., who, immediately after his election to the Pontificate, determined to transform them into Christian monuments. He invited suggestions from all parts of the world for the best means of removing the huge monolith from the Circus Nero to its present position in the great square before St. Peter's. Five hundred different schemes were submitted, and eventually Fontana, the architect, who designed the church of St. John Lateran, was employed upon the work. Fifty-two times, it is said, his efforts were unsuccessful, but after repeated benedictions and the employment of 600 men and 160 horses for upwards of twelve months, he had the gratification of completing his task. If we are to credit a very improbable story, this was, however, only performed by the extra-official counsel of an English sailor, or, as others more probably have it, of a man named Bresca, who, spite of the injunction to silence, bade them "wet the ropes," which, consequently contracting, landed the obelisk in its place. The labour will be understood when we say that the single stone weighs nearly 400 tons, that it is 82 feet 6 inches in height, and in diameter 8 feet 10 inches. It was brought from Egypt in a ship built expressly for it by Caligula, who, in the following inscription, still legible, dedicated it to Augustus and Tiberias:—DIVO. CAES. DIVI. IVLII. F. AVGVSTO.—TI. CAESARI. DIVI. AVG. F.—AVGVSTO. SACRVM.

The obelisk is of red granite, and bears no hieroglyphics. The apex is ornamented with a metal finial, surmounted by a cross, which was removed 120 years ago, when some relics of our Saviour were inserted in it. The obelisk stands upon a double pedestal; the upper one bears some bronze ornament, but the die of the pedestal being no wider than the base of the obelisk, has little more effect than to raise the whole to a height of 132 feet from the ground.

The largest and finest obelisk at Rome, then lying in three fragments in the Circus Maximus, next attracted the attention of Sixtus V. Fontana's skill and energy was again called into action. To fit the fragments together it was necessary to cut off a portion of the base, but notwithstanding this diminution, it remains the tallest obelisk in the world, and is surpassed, even in story, only by that which Semerimus is said to have cut out of the Armenian quarries, 135 feet high by 5 feet in diameter. The Lateran obelisk is still upwards of 100 feet high. It is surmounted by a cross, and stands upon a moulded pedestal. The whole height from the ground is 140 feet. There is a difference of 8½ inches in the dimensions of the sides, two being 9 feet, and the other two 9 feet 8½ inches. This peculiarity is frequently met with in Egyptian obelisks. It did not interfere with their appearance as they were originally placed—before the temples—but detracts from their beauty when fixed in the centre of a square or court. The discrepancy was doubtless intentional to afford a broader field for the inscriptions.

The Circus Maximus likewise yielded to Sixtus V. the splendid obelisk which first greets the traveller on his entrance to Rome by the Porta del Popolo. It is covered with hieroglyphics, which different interpreters have

variously translated. It appears, however, to have been brought from Heliopolis by Augustus, who, on two of its four sides, renewed its dedication to the Sun. Sixteen hundred years later it was again reared by Fontana in the same city, and not far from its former site, but this time a cross was placed as the crowning feature of the work. The obelisk itself is 78½ feet high, but with the base and ornaments rises to 116 feet.*

LABOURERS' DWELLINGS.

ONE of the most satisfactory features of the present day is the disposition which is showing itself among those who have wealth and influence to employ the advantages they thus possess for the benefit of the classes whose work has been an indispensable element in the process by which that wealth has been procured. More persons now-a-days recognise that it is the duty of an employer to care for the welfare of his workpeople than formerly; and what is perhaps of more importance, the employing class are beginning to feel that, as a class, they are bound to do what they can for the good of the labouring class, collectively as well as individually.

It has, therefore, become a matter of some importance that the best construction and arrangement for labourers' dwellings should be understood and adopted, and that those improvements which science and skill have placed within the reach of the middle and wealthy classes should be extended to the working man, both in town and country.

Much, very much, remains to be done before the dwellings of the upper and middle classes are placed in a condition of even tolerable safety and healthiness; much may be gathered from some recent observations of our own on the subject,† and from the discussion which lately took place at the Institute upon Mr. Henry Roberts's paper "On the Essentials of a Healthy Dwelling." Still it is clear that in any building of the better class, where the smallest attention was paid to sanitary considerations, or where any professional superintendence is employed, there need be no difficulty, and, generally speaking, will be none in obtaining all the security for health and comfort that well-arranged drains, dry construction, good water, and free admission of air and light will afford.

Far otherwise has it been with the dwellings of the labouring poor; till recently any advantages of this sort were almost invariably beyond their reach, and it is not too much to say that in a majority of instances, and up to a very recent date, you would find far more regard to sanitary appliances and to convenient arrangement in the stables of the farm-buildings of any proprietor, than in the dwellings of his workpeople, either in town or country.

Some of our nobility—such as, for example, the Duke of Bedford—were among the earliest to commence a system of cottage building on their estates, and many of their cottages are both picturesque and convenient. The example, like steam cultivation, land drainage, and other modern improvements, has begun to spread, and we propose in the first instance to say a few words on the requisites of a good cottage for agricultural labourers, and then to refer briefly to the improvement of the dwellings of operatives in towns. In doing this we shall endeavour, as far as possible, to avoid repeating what has already appeared on the subject in these pages, and shall, therefore, pass over some points really of great importance, but which have already received full consideration.

One of the cardinal points of good building is that every structure should be thoroughly well adapted to the requirements of its site and circumstances. This requirement when observed will raise the simplest building to the rank of an architectural work, and is as necessary to good cottage building as to anything else. The habits of the labourers in the locality must be considered, the local materials and modes of construction must be employed, and the advantages and difficulties of the site viewed in relation to drainage, aspect, water supply, levels, access and the like should be carefully considered and made the best of; and, lastly, the rate of wages and amount of rent obtainable must be taken into account in determining the extent to which desirable improvements may be carried.

For a labouring man, married and with a family, it is proper to provide four rooms—a living-room and three sleeping-rooms—one for the parents, one for boys, and one for girls. It is also extremely desirable to have a small well ventilated room or space in which the sink and the copper shall be fixed, so as to keep them out of the living-room, and a closet for provisions. The outbuildings will comprise at least a convenience and a fuel store. The habits of the district will decide whether a pigsty outside the house, and a baking oven, are or are not requisite; and whether—as is the case in Yorkshire—the kitchen-range commonly preferred will not supersede both oven and boiler; whether the floor of the living-room shall be of brick or boarded, and an immense number of minor points.

In such a cottage as this, one sleeping-room must be on the ground floor in order to economise space, and convenience as well as economy will be consulted by building pairs or groups of three or four.

One of the great difficulties to be contended against in arranging cottages is the necessity of allowing and providing for the taking of single men, employed in the neighbourhood, as lodgers; although, at the same time, the most objectionable occurrences are constantly arising in consequence of this custom. In a cottage such as we have described, occupied by a family with only young children, the ground floor bedroom can be conveniently and suitably allotted to this purpose. When the family is older, this, of course, ought not to be allowed, and provision might be made for adding an additional bedroom on the ground floor, at the back of the house, for a lodger. We have seen in some excellent labourers'

cottages arranged for factory workpeople a small back kitchen appended to the house, with a bedroom over, accessible either out of the parents' bed-room, through a door which can be closed at night, or by a ladder in the back kitchen itself. This arrangement renders it possible to accommodate a lodger, and yet shut him out completely from the family at unseasonable hours; so that should he not return at the hour of going to bed, he can reach his room without entering the house at all.

It is idle to say, prohibit lodgers, although this is actually said by the less considerate among those who promote cottage improvement. Such a prohibition cannot be enforced and had better, therefore, not be attempted. It will be more prudent to provide for the lodger, and to regulate strictly the number of them allowed on the estate.

Three-roomed and even two-roomed cottages are useful for labourers with no families or small ones, and should be occasionally built. The size of the rooms it is difficult to regulate; the best rule to give is, build them as large as you can afford, for the evil of not having a separate room for children of each sex is so great that it would be better to form two closets no larger than ships' cabins rather than put them together in one room of better size.

This brings us to the very vital consideration of cost. Even the wealthiest man will feel reluctant to continue investing money in cottage improvement if he finds a very bad return from it; and the majority of landowners and farmers will be entirely deterred from the attempt, should such a result seem even probable. With care and judgment, cottages can be built so as to yield a moderate return, and no landowner, building for the good of his own tenantry, and as an example to his neighbours, should allow himself to exceed such an outlay as the rent he can get will pay interest upon. If he does, he may, indeed, benefit his own people, but he will fail to do much good to those around.

It is not because of the fashion having set in that way that farmers have taken up with drainage and subsoil ploughs, but because of the heavy harvests got off the lands so treated; and it will require the greatest care on the part of those promoting improved cottage building to place it on anything like the same footing.

There are many districts where eighteenpence a week is as much as can possibly be paid by a labourer for a cottage. This amounts to within two shillings of four pounds a year, and it is not too much to say that any good cottages fetching this rent, built for £80 or less each, will be sure to be copied or imitated extensively; if they cost a hundred pounds each they will be but little followed, and if they cost a hundred and twenty pounds each or more, they will probably remain solitary examples.

There are certain things which ought not to be postponed for any consideration, such as the separation of the sexes, drainage, water supply, dryness, warmth, ventilation, and such general solidity as will reduce the cost of maintenance to a minimum.

These being secured, the question of cost becomes one of paramount importance, especially in rural districts, and probably nothing but actual experiment will suffice in many cases to show what is the lowest amount for which it is possible to build. Great simplicity of plan and of details, a dexterous use of the materials nearest to hand, and, where possible, a repetition of the same parts, or the same sizes, will tell very markedly upon the total cost, more especially where a number of cottages are to be built, and need not, with care, exclude picturesque effect and an air of finish and completeness.

Perhaps the most advantageous circumstances under which cottage dwellings can be built, occur when they can be placed in the vicinity of large towns. The artisans and even ordinary labourers get better pay in towns than in rural districts, and consequently can afford higher rent; while, at the same time, land and building are not so costly in the outlying districts adjoining those towns as to counterbalance this advantage, so that, when carried on with prudence, cottage building in such neighbourhoods will be found very remunerative.

The case of the dwellings of the labouring population in London, or in the heart of any great city, presents difficulties as formidable, if not more so, than those which beset the improvement of cottages in rural districts; for, although the wages of skilled artisans are high and the better sort of labourers get good pay, yet there is an immense mass of the population sunk in the greatest poverty; and, at the same time, the cost of building materials and labour, but, above all, the value of land is so high, that a very much higher rent must be required of tenants in order to make such an undertaking as the building of decent tenements for labouring people at all remunerative.

There is little doubt, however, that by the plan of building agglomerated dwellings, the cost of sites, and, to some extent, the cost of such parts of the building as foundations, roof, drains, water supply, and gas piping, may be distributed over so large a number of tenements as very much to counterbalance the disadvantage referred to.

Few poor people in London dwell in an entire house; an immense number are lodgers in large houses, now mean and squalid, but once the dwellings of a richer class, who have forsaken the neighbourhood; and such occupy a single room, or two rooms, miserable and wretched beyond description. It has, therefore, been found practicable to provide large buildings, cut up into small tenements, to the occupation of which the poor have not the smallest repugnance, and which usually enjoy the advantage of the very best possible arrangement, so far as drainage, water supply, dryness, warmth, and ventilation go.

The returns of profit from these buildings vary, but it is clear that some of them really merit the reputation of highly remunerative undertakings, and as in some of them a certain amount of quiet lavishness or retiring ostentation, if one may so speak, can be traced, it seems pretty clear that,

* To be continued.

† Page 47, ante.

with good management and economical construction, the building of lofty blocks of workmen's domiciles may be counted upon as sure to pay.

A very large part of London, however, is covered by small two or three storied tenements, which seem to let readily enough. A visitor finds them generally parcelled out among lodgers, who enjoy none of the advantages of a building originally designed in order to be let out to separate occupants, while, on the other hand, the owners of the house can have little or none of the comfort of people who live undisturbed in a quiet separate home of their own.

The great number of these small and comparatively low houses, each with its own little space behind it, is one of the causes of that extraordinary extent which is far from being the least of the difficulties with which those who have the control of London streets or sewage, or gas or water, have to contend. Were it but practicable to introduce the habit of building loftier buildings, arranged for the purpose of division into floors or tenements, as is, for example, customary in Edinburgh and in Paris, a great deal more might be made of the area of London than is now possible.

To those who contemplate the erection of buildings of this nature, the statement of Mr. Roberts at the late discussion at the Institute will be important. He then observed that tenements built in blocks on the "open gallery" system are held to be separate tenements, and are exempted from rating, whereas those which form one block with internal corridors and staircases are liable to be considered as one building and rated accordingly. This will make a very considerable difference in the receipts, and consequently in the profits of such undertakings.*

We would conclude by repeating emphatically the truth which has been already implied in what was said about rural cottages—namely, that it is most essential to go low enough. We thought, with our national schools and our ragged schools, that we were educating the children of the poor, when suddenly the establishment of ragged schools and reformatories brought to light a vast mass of ignorant, untaught children, below the reach of all previous existing means of culture. It has been very much so with labourers' dwellings.

There are many families in London who can only afford, and will only choose to live in a single room. If we build tenements, and declare that in no case shall fewer than three rooms be let together, we insure decent accommodation, but we leave the very poor entirely unhelped.

So it is with many other features of the labourers' dwelling movement; and while earnestly desiring that the number of single-room tenements for families shall be reduced as low as possible, we yet must plead for the improvement of these as well as of large and better dwellings.

The model dwellings have done much good; the recent proposals for building labourers' cottages on the railway lines out of London appear likely to be also beneficial; but we look round to know what is being done for the very, very poor; and beyond some little amount of legislative interference as regards lodging-houses, and some sort of sanitary interference about drainage, we find as yet little or nothing accomplished, but an immense amount of work to be done.

HANDEL FESTIVAL AT THE CRYSTAL PALACE.

THE directors have issued a programme of arrangements for the forthcoming Triennial Handel Festival at the Crystal Palace. Considerable additions are now in progress in the centre transept, having for their object increased accommodation and improved acoustical arrangements. It will be remembered that the larger portion of the present orchestra was built in 1857. In 1859 it was enlarged, and was also enclosed at the sides and back with screens.

Disinclination, however, at that time to undertake so large a work as entirely roofing the orchestra with similar material to that of the sides and back, led to the employment of a vast oiled and hardened awning of canvas, after the manner of the Velaria. This, although effective to a considerable extent, did not, it is candidly admitted, effect all that had been anticipated. Neither in form nor structure could all be attained that was intended. And thus the force and clearness of the choruses—improved as they were—did not reach the point anticipated from the additions made to the numbers of the orchestra, while it was no less evident that still more required to be done to aid the solo singers. It is now determined that the entire orchestra and the space beyond it as far as the intersection of the great transept with the nave, shall be solidly roofed in.

The width of the orchestra will be 216 feet, the sides are about sixty feet high, or nearly the same as the Birmingham Town-hall. Wooden girders being carried across, in the form of an arch, rising about 40 feet in a clear span of 216 feet, the underside will be filled in with bracings, lined with well-seasoned match-boarding bound closely together by ingenious appliances, until the whole surface becomes as hard and as resonant as a drum-head.

A sketch of the roofs of various music halls, cathedrals, and other places used for great musical performances, all drawn to the same scale, is appended to the programme. In this comparative view the large extent of the roof over the Handel Orchestra is very apparent.

The performances will take place on Monday, Wednesday, and Friday, June the 23rd, 25th and 27th.

THE PROPOSED RAILWAY BRIDGE AT BLACKFRIARS.
